Thus, since 1919, the International Labour Organisation has come a sort of great clearing house of all information on questions. It has a library of 150,000 volumes. The ideal woul to make of it a centre where workers would be certain of findi publications of all countries touching on the regulation of lab This office collects by means of corresponding offices in Paris, Ro Berlin, London, Washington and Tōkyō, and collaborators in ot capitals, periodical information on social developments in great countries. It publishes two general periodicals: the wee *Industrial and Labour Information*, the task of which is to give exact account of important news in the various branches of so life, and a scientific monthly review, the *International Labour R* It further publishes the *Industrial Safety Survey*, which reports new measures taken and all experiences obtained regarding secu of labour; and a *Monthly Record of Migration*. It publishes revi or bulletins giving a summary of all these publications for the in mation of different countries, in German in Berlin, in Italian in Ro in Spanish in Madrid and in Japanese in Tōkyō. Carrying on tradition inaugurated before the War by the Basel office, it publis an annual collection, in French, English and Italian, of the d ments of social legislation promulgated every year in different co tries (*Legislative Series*). Since its formation it has underta enquiries on a large scale in all matters of particular import Among them may be mentioned the great *Enquête sur la Produ* which deals with the economic situation of the world between 1 and 1925; an inquiry into the conditions of labour in all the ucing countries; inquiry into legislation and labour conditions ussia; another into labour conditions in Asia, etc. It publishes terly a *Bibliography of Industrial Hygiene.*

ıe I.L.O. has also attempted to simplify and unify methods of ur statistics used in different countries. Two conferences of ur statisticians have already been convoked under its auspices. y year more demands for information are addressed to it by rent governments. Corresponding committees, consultations of rts and special commissions permit the Office to maintain con- with technicians and scientists of the branches of social life.

ıternal Organisation of the Office.—In order to deal with its old task of keeping up daily contact with the governments, especially with the Ministries of Labour with which it corre- ds directly under Art. 397 of the treaty, and with the organi- ns of workers or employers, the office has to equip itself a sound internal organisation. Under the Peace Treaty it ministered by a governing body nominated for three years ıe Conference. The governing body consists of 24 members, hich 12 represent the governments, six the employers and he workers. Of the 12 governmental representatives eight ıg *ex officio* to the most important industrial countries (Ger- y, Belgium, Canada, France, Great Britain, India, Italy and n). If any dispute arises regarding relative industrial im- ınce, this must be settled by the Council of the League of ons. A system of indexes has been adopted (based on pop- on, working population in relation to the total population, n horse-power, length of railway lines, etc.) which makes ssible to decide this point. The six workers' representa- are nominated by the delegates to the conference represent- he workers, and the six employers' representatives by the oyers' delegates. The conference has proposed to enlarge the rning Body, but this will need the amendment of the Peace ty, and it has not yet been done on account of the slow edure of ratification of the amendment, necessary under 422 of the treaty.

.e Governing Body nominates a director and gives him his uctions. The director nominated in 1920 was M. Albert nas, formerly a French Minister of State. He is assisted by a ty director, who is an Englishman, Mr. Harold B. Butler. The nnel of the International Labour Organisation amounted in to about 370 employees of all ranks, who were drawn from fferent nationalities. Under Art. 395 of the Peace Treaty lirector "shall as far as possible, with due regard to the ency of the work of the office, select persons of different nalities." The nations chiefly represented among the per- el are France and Great Britain, because French and English ıe two official languages used by the office; next, Switzerland, ıse the executive personnel is recruited locally.

.e budget of the International Labour Organisation varies een 7,000,000 and 8,000,000 gold francs. This budget is duced annually by the governing body before the Assem- f the League of Nations. It is supplied for the most part by ibutions from the states which are members of the organisa- This contribution is fixed under a scale adopted by the ue of Nations for its own contributions.

lation to the League.—The International Labour Organisa- is in fact part of the organisation of the League. For this n, since 1920 it has been established at Geneva. It was first lled in an old college. In 1922 the sum of 3,000,000 gold s was voted for the erection of a suitable building on a site n had been given for this purpose by the Swiss Federation. I.L.O. is attached to the League of Nations and entitled assistance, when required, and receives the funds granted the states through the League, but is nevertheless, like the anent Court of International Justice, an autonomous in- ion. Its decisions are not subject to the control of the cil of the League: The Director of the office is in no way rdinate to the Secretary-General of the League. Indeed, mbership of the League carries with it membership of the . (Art. 387), it was decided by the persons who negotiated eace Treaty as by the Assembly of the League of Nations in that states which are not members of the League can be- members of the I.L.O. Thus, since 1919 Germany has be- d to the I.L.O. with equal rights without being a member of the League. A representative of the German Govt. has always sat on the governing body; the workers' group has regularly elected a German member, and the employers have also, since 1922, had a German member in the governing body. There are German employees throughout the office.

In order to gain general information and to carry through scientific research, the I.L.O. remains in almost daily contact with the U.S.A. and with Russia, the only two great states which, for various reasons, do not belong to the organisation.

Conclusion.—The organisation has often been criticised and attacked. It has been reproached with the desire to exceed the limits of its competence. The Permanent Court of International Justice decided, at least in the case of agriculture, that this criticism was not justified. It has also been reproached with being exclusively guided by the workers' interests, and even with being guided by Socialist thought. Yet, no instance has taken place which could justify such an accusation against the director or even less against the governing body. But one fact must not be forgotten, which was brought out in 1921 by a report of the Commission of Inquiry and Organisation of the League of Nations, that the International Labour Office is not simply an organ of conciliation or of keeping the balance between various industrial interests; it must look for conciliation only in order to attain a definite end, which is to realise the programme drawn up in the preamble to Part XIII. of the Peace Treaty. Experience also shows that measures protecting workmen are never fully carried through unless they are made by agreement with the workers and unless the workers are interested in their application.

It is one of the merits of the International Labour Organisation, as conceived and conducted since 1919, that it has been able to keep the sympathies and confidence of the important workers' mass organisations. It is true that the Communists, the leaders of the Third International, violently attack the collaboration of workers in the work of Geneva. But the International Federation of Amsterdam, with its 20,000,000 members, the Christian Unions, the Italian Fascist organisations, take regular part in the conferences of Geneva, and demand that the conventions be applied. It is equally remarkable that the employers continue to be represented at the conferences and on the governing body.

The office of the International Labour Organisation, while it aims at bringing about the "physical, moral and intellectual well-being of the wage-earners," attempts at the same time to take account both of the interests of production, and (to quote Art. 427 of the Peace Treaty) of the differences of climate, habits and customs of economic opportunity and industrial tradition, which make strict uniformity in the conditions of labour difficult of immediate attainment." Further, from the general point of view, the International Labour Organisation has helped to popularise among the industrial masses both of the workers and even of the employers the idea of a definite peace based on an economic understanding and the social solidarity of the nations. It is already the great centre of international collaboration. It is recognised as being one of the great factors of peace. Its history bears witness to all the difficulties attending new international creations. The life of a nation enjoys the natural support of geographical contiguity, of racial community and of age-long tradition. An international organisation can only come to birth and live if public opinion and the judgment of the governments favours a common programme. It appears that the programme of social justice drawn up in the Peace Treaty has sufficient authority and sufficient reason to assure the existence of the International Labour Organisation.

BIBLIOGRAPHY.—See *The Treaty of Peace between the Allied and Associated Powers and Germany*, Part XIII. (H.M. Stationery Office, London, 1925). A list of publications of the International Labour Office can be obtained from the Publications Department of the Office at Geneva, or from their correspondents in different countries.

(A. TH.*)

INTERNATIONAL LAW (*see* 14.694).—The outstanding developments in international law since 1910 are so distinctive that it has been considered expedient to deal with them under separate headings, rather than to attempt to present them in any one general article. The attention of the student is especially drawn to the following articles: ARBITRATION, INTERNATIONAL; BLOCKADE; COVENANT; INLAND WATER TRANSPORT; INTERNATIONAL LABOUR ORGANISATION; LEAGUE OF NATIONS; MANDATES; MIGRATION; MINORITIES; PERMANENT COURT OF INTERNATIONAL JUSTICE; SANCTIONS AND GUARANTEES; TREATIES; WASHINGTON CONFERENCE.

INTERSTATE COMMERCE (*see* 14.711).—Since 1910 Acts of the United States Congress and decisions of the Supreme Court have extended the scope of Federal control over interstate commerce. The regulation of railways was made more complete, the Federal authority being widened to cover railway rates on traffic within the states when such rates affect interstate commerce. The Anti-Trust Act 1890 was broadened and strengthened by the decisions of the Supreme Court in the oil and tobacco cases in 1911 and by the Clayton Act 1913. In the adjustment of labour disputes between employers and employees engaged in interstate commerce the Government assumed a constantly larger rôle.

Railway Regulation.—The Interstate Commerce Commission was given authority by the Hepburn Act 1906 to establish reasonable maximum rates on interstate traffic, but could act on complaint only. The Mann-Elkins Act 1910 authorised the commission to establish reasonable rates after hearings initiated by itself. This Act also made the Interstate Commerce Act apply to telegraph and telephone companies, and gave the commission authority to suspend proposed increases in rates. While such proposed increases were to become effective in 30 days, the commission might suspend the increase for 120 days, and, if necessary, for an additional period not exceeding six months. The Mann-Elkins Act provided also that no carrier might charge more for a shorter intermediate haul than for a longer haul until he had applied to the commission and permission had been granted because of special circumstances. The Supreme Court subsequently decided that a shipper who, in violation of this provision, has been charged the higher rate for the shorter haul is entitled to the full amount of his resulting damages, but not the difference between the rate paid and the lower rate published for the longer haul (*Davis v. Portland Seed Co.*, 1923, 264 U.S. 403).

The Panama Act 1912 made it unlawful for any railway company or common carrier subject to the Interstate Commerce Act to secure control of any common carrier by water operating through the Panama Canal or elsewhere, provided the carrier by water and the railway company did or might compete with each other. Any questions of fact as to competition were to be decided by the commission. If the commission should be of opinion that the public interests would be served and competition would not be prevented or reduced by the continuance of a control exercised by a railway company over a competing carrier by water, the commission might extend the period of control. In enforcing this provision, the commission compelled the trunk-line railways operating passenger and freight lines on the Great Lakes to dispose of them, but railways were permitted to continue the operation of steamships coastwise between New England ports. The use of the Panama Canal by vessels owned by a competing railway was absolutely prohibited. Any rail carrier that had entered into through arrangements with a carrier by water operating from a United States port to a foreign country was required to enter into like arrangements with any or all other lines of steamships operating from the same port, a provision designed to ensure to shippers from interior points the benefits of competition by through routes to foreign destinations.

The most important legislation affecting carriers enacted after the passage of the original Interstate Commerce Law in 1887 was the Transportation Act 1920, by which the railways, after 26 months of government operation, were returned to their owners. This Act provided for a more comprehensive regulation of carriers by the commission and established new principles in the regulation of rates, revenues and capital expenditure of the carriers. The commission, already the final authority as to rates, was further empowered and directed to adjust rates with a view to enabling carriers, as a whole, to earn as nearly as may be $5\frac{1}{2}\%$ on the aggregate value of their property devoted to the pul service. The commission might also authorise the carriers to ea one-half of 1% per annum additional, the amount thus earn to be devoted to improvements without capitalising the amou so invested. Individual carriers whose net operating revenu exceeded 6% were to devote one half of the excess to buildi up a company reserve fund until the amount reached 5%, t other half of the excess being turned over to the Governme and placed in a fund from which advances might be made to t carriers. At the end of two years after the passage of the A the commission was to determine the reasonable rate of retu on the aggregate value of the railways, and the commission fix the rate at $5\frac{3}{4}\%$ per annum. The Act also authorised the co mission to regulate railway securities, and amended the la against combinations so as to permit railway companies consolidate with the commission's approval.

Intrastate Rates.—The power of the Federal Govt. over i trastate rates was extended by important decisions of the Supre Court and by the Transportation Act 1920. In the Minnesota Ra Case (*Simpson v. Shepard* (1914), 230 U.S. 352), the Supreme Co upheld the action of the State of Minnesota establishing railw rates within the state, although the facts showed that these intr state rules affected the rates on interstate traffic and the revenues the carriers engaged both in interstate and intrastate traffic. 1914 the Supreme Court was also called on to consider the validity the order of the Interstate Commerce Commission in what is kno as the Shreveport Case. The business interests of Shreveport, L had complained to the commission that rates within the State Texas, which had been fixed by the state commission of Texas, we so much lower than the interstate rates that it was not possible f the merchants of Shreveport to do business in northwestern Tex The commission decided that the wide difference between the inte state and intrastate rates constituted an unreasonable discrimin tion, and the carriers were ordered to correct this. On appeal, t Supreme Court upheld the order of the commission (*Houston,* *and West Texas Co. v. United States*, 234 U.S. 342).

The principle established by this decision was embodied in t Transportation Act 1920, which provided that when the Intersta Commerce Commission finds that any intrastate rate constitutes unjust discrimination against interstate or foreign commerce, t commission may prescribe the maximum or minimum intrasta rate thereafter to be charged. Another important decision of t Supreme Court, rendered in 1922, affirmed an order of the Intersta Commerce Commission on this point in connection with what known as the Wisconsin Passenger Fares. The order of the comm sion required a horizontal increase of intrastate passenger fares excess-baggage charges to correspond with fares and charges fix for like interstate service in the same state. The Wisconsin Railr Commission sought to have the commission's order overruled, b the petition was denied (*Wisconsin R. R. Comm. v. C. B. and Q. R.* *Co.*, 257 U.S. 563).

Amendments to the Anti-Trust Act of 1890.—Prior to 1911 t Supreme Court by a series of decisions (*see* 14.711) had defi the scope of the Anti-Trust Law of 1890, but the net effect of t interpretations had been to limit its effectiveness. Howe in the oil and tobacco cases decided in 1911 (221 U.S. 1 and 1 the Supreme Court adopted a " rule of reason " formulated Chief Justice White, which gave greater flexibility to the A and promised to make the law more effective. The court he in effect, that the purpose of the law was to prevent und restraint of every kind, and that it did not deny to individua the right to enter into contracts when the right was not impro ly exercised. This interpretation of the Anti-Trust Law was u satisfactory to the extreme opponents of industrial combinatio and in response the Clayton Act was passed in 1914, prohibitin under specified provision, discriminations in prices. Lab unions and organisations of farmers were exempted from t provisions of this law. Interlocking directorates of banks we prohibited, and it was made unlawful for a corporation, engage in interstate commerce, to acquire control by stock ownersh of another corporation engaged in interstate commerce when su acquisition would lessen competition. Carriers engaged interstate commerce were prohibited, after two years from t passage of the Act, from dealing in securities or supplies a from making construction contracts amounting to more th $50,000 with a corporation, firm or partnership having on board of directors or as one of its officers a person who was the same time a director or officer of the common carrier. Th vision was suspended until after the conclusion of the World but was in force in 1921. An important decision of the reme Court subsequent to 1911 was its finding, in *United s v. U.S. Steel Corporation*, March 1 1920, that the largest l industrial combinations was not a violator of the Anti-Trust (251 U.S. 417). It reached the conclusion that the public rest would not be served by requiring the dissolution of the l Corporation, but that, on the contrary, its dissolution nt result in a material disturbance to American foreign trade.

djustment of Labour Disputes.—The Erdman Act 1898 was nded by the Newlands Act 1913, which provided for a board om five to nine men, and also created a board of mediation conciliation composed of a commissioner and two other offi- designated by the Government. By 1916, however, the rail- employees had become dissatisfied with the results of ration, and demanded the establishment of an eight-hour and a general increase in wages. The carriers resisted, and esulting deadlock was broken by the passage of the Adam- Act 1916, establishing the standard eight-hour day in the vay service and providing for a commission to decide upon es. The Supreme Court held the law to be constitutional U.S. 232). The Transportation Act 1920 substituted new hinery for the adjustment of disputes as to wages and work- conditions in the place of the provisions of the Adamson Act. he Transportation Act it became the duty of employers and loyees to endeavour to settle their differences by negotiation. egotiation failed, disputes as to working conditions might be red to boards of adjustment composed of an equal number presentatives of both sides. These boards might be either , district or national. Provision was also made for the ap- tment by the president of a railroad labour board of nine : three representing the public, three the employees and the companies. Such a board was constituted in 1920.

1926 Congress enacted the Railway Labor Act which sub- ted new machinery in place of that created in the Trans- ation Act of 1920. It makes it the duty of the carriers and employees to exert every reasonable effort to make and tain agreements. All disputes are first to be considered in rences between the parties directly concerned; and adjust- boards either on individual lines, or regional, or national provided to adjust disputes arising under such agreements to interpret and apply them. Disputes that cannot be so sted may be referred to a board of mediation by either , or the proposed board may intervene on its own initia- and if an amicable adjustment cannot be attained in this ner, an effort is to be made to induce both parties to agree luntary arbitration. Should such effort be unsuccessful and nterruption of commerce be threatened, the President is authorised, in his discretion, to create a board to investi- and report to him within the next succeeding thirty days, a proviso is included to the effect, that, in the event that eps leading up to the appointment of this emergency board to bring about a settlement, transportation may not be rupted for a period of 60 days. It is understood that act had the approval of large groups of railway executives, mployees, and is the result of a series of joint conferences.

nited States Coal Commission.—In 1922 an Act was passed ring that a national emergency existed in the production, portation and distribution of coal and other fuel. It gave lementary powers to the Interstate Commerce Commission sue, in transportation of coal or other fuel, orders for ities in car service, embargoes and other suitable measures, to take any other necessary steps for the priority in trans- tion, and for the equitable distribution, of coal or other fuel prevent their purchase or sale at prices unreasonably high. 23 an Amending Act established the U.S. Coal Commission t more than seven members for the purpose of securing mation in connection with questions relative to interstate nerce in coal and all questions and problems arising out of onnected with the coal industry. The commission's report ined a full account of economic conditions in the coal- g industry.

(E. R. J.)

INVENTION.—Nothing is more significant of the activities of human ingenuity than the tale of the inventions which reach the national patent offices for record and official approval. The stimulus of social conditions and economic necessity are marked most significantly here. Why some inventions succeed is often obvious. Many inventions fail to achieve commercial success though valuable and useful in themselves, sometimes because existing processes adequately satisfy the need, sometimes because they are too advanced and the need for them has not yet arrived. Indeed, analysis of the causes of failure is full of interest. The phenomena of cultural lag deserve serious study.

Previous Knowledge.—All inventions, in a sense, are conditioned by existing knowledge, nearly all depend directly or indirectly on previous conditions. The motor-car, the aeroplane, wireless telegraphy, the steam turbine, could not have reached their present stage of development without a long series of prior inventions. The science of the metallurgist, the chemist, the physicist, has made it possible to produce materials which combine strength with lightness, which possess properties in the required degree—magnetic, electric, chemical—so that even the simplest product represents the sum of a series of minor inventions and contributions to knowledge.

The range of problems presented to the inventor is well shown by the progress of invention as applied to the motor-car. The development of the internal-combustion engine entailed improvements in the magneto, in carburettors, in the "timing" gear, in the valves, improvements due to advances in electrical science and metallurgy. With increase of power comes the necessity for greater brake power. Night travel demands better lighting. Popular demand requires mass production. That in turn involves standardisation and that is impossible without prior advances in the manufacture of machine tools (*q.v.*) and measuring instruments (*q.v.*). Here pure science is called in to solve the problems which underlie modern economic activity. Then there is the need for simplification and strength. The car must be made safe and foolproof. The tendency to elaboration is constantly checked by the need for simplicity.

Key Inventions.—There are, of course, key inventions which open vast ranges of further development. These attract attention and are, in every sense, of the highest importance. Nevertheless, there may be as much ingenuity and utility in a single device which simplifies some elaborate process or meets some widespread human need. Such inventions as these, too, deserve, even if they do not always achieve, success.

Every Patent Office throughout the world when its records are studied broadly on these lines tells the same tale. Thus, in Great Britain since 1910, the trend of invention has varied considerably owing to important changes in social conditions. The inventions of the years 1910–4, when social conditions were normal, present a trend very different from that of the War period and different from that of the years 1919–25, which was a period of recuperation and reconstruction. These three periods, however, have one important common feature, viz., that the numbers of inventions relating to locomotion and intercommunication were exceptionally great.

INVENTIONS OF THE PERIOD 1910–4

Motor-cars, etc.—The first application of self-starters to motor-cars seems to have been made by the Adams Manufacturing Co., of Bedford, in 1911 and was followed by many inventions for mechanism of this kind. There were also numerous inventions for variable-speed gears, lighting sets, detachable rims and spring wheels. In motor-cycles, the replacement of belt or chain variable-speed gearing by toothed gearing and the introduction of the kick starter determined the modern form. Many forms of lifeguards for use on trams and omnibuses were patented and, after the taxi dispute in 1911, there were many inventions for registering "extras" (*see* MOTOR VEHICLES). Inventive activity was very marked in connection with internal-combustion engines, especially those of the fixed radial, revolving cylinder and "valveless" types, and in carburettors (*see* INTERNAL COMBUSTION ENGINE).

Aeronautics.—Many of the aeroplane inventions related to details of machines which, like the Farman biplane and the Morane monoplane, were well known. The use of these inventions eliminated, to a large extent, unsuitable flying-machines. Directly driven tractor screws and rear elevators became more generally adopted. The importance of aircraft as an auxiliary in warfare was appreciated and, in 1911, inventions for launching aeroplanes from the decks of battleships were patented. The airships "Beta" and "Gamma," built at Farnborough, made several successful flights; they were inflated with hydrogen generated in Oerlikon electrolysers, which usually employed a pure solution of potash. About the year 1912, the seaplane, provided with floats, was brought into use (*see* AEROPLANE; AIRSHIP; SEAPLANE).

Railway Signalling.—A series of inventions for automatic signalling to prevent trains from being signalled into a section containing a standing train was patented in 1911, after the accidents at Hawes Junction and Pontypridd. In 1913, there were many inventions for automatically signalling and stopping trains and in 1914 for locking carriage doors from the guard's van (*see* RAILWAY SIGNALLING).

Life Saving.—Following the disaster to the "Titanic" (*q.v.*) in 1912, there were many inventions for life-saving appliances for personal wear, detachable ships' fittings to serve as rafts, and boat-lowering gear; there were also inventions for enabling a ship to receive wireless distress signals when the operator was off duty.

Transmission Gear.—The Constantinesco system of transmitting power by means of a pulsating column of water was applied to rock drills and other apparatus.

Water Supply.—In the year 1913, the Metropolitan Water Board brought into use, at their Chingford reservoir, a powerful pump of the pulsometer type, the Humphreys internal combustion pump (*see* PUMPS).

Telephones.—The first automatic telephone exchange for public use in England was opened at Epsom, in 1912. Following this, there were many inventions relating to junction and trunk line working for facilitating the gradual introduction of automatic systems (*see* TELEPHONES).

Fixation of Nitrogen.—Many inventions for the synthetic production of ammonia from the nitrogen of the atmosphere were patented, some of the most important being those of the Badische Anilin und Soda Fabrik, developing the catalytic Haber process. (*See* NITROGEN, FIXATION OF.)

Medicine.—Ehrlich's invention of Salvarsan, introduced in 1910, for the treatment of venereal and other spirochaetal diseases, has been of great value (*see* PHARMACOLOGY).

Rubber, etc.—In 1911–3, there were many inventions relating to the synthetic production of isoprene and of rubber, the coagulation of rubber latex and the cold process of vulcanisation by using sulphuretted hydrogen and sulphurous acid gas in succession (Peachey's process). The use of accelerators, *e.g.*, piperidine, was also introduced in vulcanising (*see* RUBBER).

In 1913, there were series of inventions for converting heavy oils into motor spirit and for obtaining light oils from coal by carbonising at a low temperature.

Stainless steel, a chromium-steel alloy, was brought into use toward the end of the period.

Electric Lamps.—In connection with filaments for incandescent electric lamps, many inventions related to the production of osmium, tantalum, niobium, molybdenum, and tungsten and to apparatus for swaging and wiredrawing these metals. One of the most important inventions of the period was the half-watt lamp, British Patent Specification, No. 10918 of 1913 (*see* ELECTRIC LIGHTING).

The thermionic valve for use in wireless was another very important invention.

In the textile industry, there were many inventions relating to collecting dust in and ventilating cotton-mills and to mechanical means for shuttle-threading. There were numerous inventions for gyro-compasses (*see* GYROSCOPES), artificial horizons, gyro-stabilisers, and other apparatus depending on the application of the gyro principle. The selection and intermittent exposure of advertisements and the projection of cinema pictures in natural colours were important subjects of invention. There were also many inventions for slider or "lightning" fastenings for corsets, boots and pouches.

INVENTIONS OF THE WAR PERIOD

The numbers of inventions connected with industries, other than those of importance in warfare, fell off considerably. Inventions connected with military and naval operations were brought into use in rapid succession; periscopes (*q.v.*), Mills bombs (*q.v.*), the Lewis gun, the paravane (*q.v.*) for protecting ships from mines and torpedoes, camouflage (*q.v.*) systems, depth charges and other means for use against submarines, Pomeroy and other explosive and incendiary bullets for use against Zeppelins, the tanks (*q.v.*), body armour, and combination knives, forks and spoons are only a few examples.

Aircraft.—The inventions connected with aircraft were of outstanding importance and their use resulted in the production of many highly efficient machines. The Fokker monoplane had an all-metal fuselage and a tractor screw through which a Maxim gun was arranged to fire by means of a synchronising gear. The D.H.2, a British single-seater biplane with pusher screw and a wide range of fire was used successfully until it was superseded by machines with a tractor screw through which a Vickers machine-gun w arranged to fire by means of Constantinesco's hydraulic synch nising gear. The twin-engined Gotha was a long-distance Germ bombing-machine and was provided with a sighting-telescope ca ble of being used with scientific accuracy.

Thermionic Valves, etc.—Thermionic valves (vacuum tubes) for in telephony and wireless receivers (*see* VACUUM TUBES; WIRELE the recovery of benzene, toluene and other hydrocarbons in and coke manufacture, and the synthetic production of ammo received a great deal of attention.

Michell Bearings.—The segmental pivoted thrust blocks known Michell bearings were used on a large scale, especially in submar (*q.v.*). These bearings were first made in 1905 and, in 1913, w fitted in the cross-channel steamer "Paris." Michell bearings ta up a comparatively small space and are easily lubricated.

There was a large number of inventions for toys and games o warlike kind and for the manufacture of dolls' heads and eyes whi before the War, had been imported in large quantities.

INVENTIONS OF THE PERIOD 1919–25

The trend of invention reverted to a large extent towa improvements of commercial importance. It resembles t trend of invention for the period 1910–4, but presents the ad tional feature that rapid and extensive developments have be made possible by utilising inventions brought into use un war conditions. This is exemplified in aeronautics by the lo distance flights to many countries during the past few years; long-distance wireless telephony and broadcasting (*q.v.*) ma possible by the use, during the War, of efficient thermionic val in telephony from aeroplanes; and, in the chemical industry, the recent successes in the commercial production of ammo from the nitrogen of the atmosphere, following the improveme made during the War (*see* NITROGEN, FIXATION OF).

The Autogyro.—A remarkable form of aeroplane, the Autogy patented by Señor de la Cierva, of Madrid (British Patent Specifi tion, No. 196594), is capable of descending vertically or nearly with safety. It differs fundamentally from the Helicopter in that windmill is not driven by power but, as its name indicates, tu freely upon its shaft (*see* AEROPLANE).

Internal Combustion Engines.—The use of the Diesel and other motors in place of steam-engines has made great progress. A re invention by the Vulcan Co., of Stettin, introduces a hydraulic tr mission gear between the motor and the ship's propellor to minim the effects of vibration (*see* TRANSMISSION GEAR).

Turbines, etc.—During the last few years, there have been inventi for the application of turbine engines for driving locomotives a many inventions have had for their object the increasing of t efficiency of steam engines by using steam at very high pressu In the Blonquist steam generator, producing steam at about lb. per sq. in. the generator elements are horizontal steel tu rotating rapidly so that the water in each tube forms an annul A boiler at Weymouth, Mass., operates at a pressure of 1200 lb. sq. in. (*see* BOILER; STEAM ENGINE; TURBINE).

Motor-car Problems.—An inertia gear, invented by Constan nesco, is designed to adjust automatically the power develope the motor of a vehicle in accordance with the varying resistanc inclined roads or on roads having surfaces of varying quality. the supply of petrol to motor-cars and other vehicles on the ro there have been brought into use many forms of petrol pumps a other delivery apparatus; these have been mostly of Americ origin (*see* MOTOR VEHICLES).

Shipbuilding.—In the construction of ships, a combination of t longitudinal and the transverse systems of framing has been broug into use and there is a tendency toward the use of the longitudi for the bottom of the ship and the upper deck and the transvers the sides (*see* SHIPBUILDING).

Gyroscopes.—There has been great attention devoted to t application of the gyroscope in the arts, especially in connecti with automatic-steering apparatus, ship stabilisers, gun-cont apparatus and aerial photography (*see* GYROSCOPES).

Vacuum Tubes and Thermionic Valve.—For the efficient worki of thermionic valves, the use of high *vacua* is important and the have been inventions for obtaining these *vacua* by eliminating fro the bulb or other vessel not only the air but also residual mercu vapour. These *vacua* have also been of great importance in X-r tubes for shortening the time of exposure (*see* VACUUM TUBE Thermionic valves have also been used in gramophones to replace ordinary amplifying means; large diaphragms have also been us recently in gramophones for amplifying purposes.

Activated Carbon.—A form of carbon with an exceptionally hi degree of porosity has been invented. It is called "activated c bon" and its gas-occluding, catalytic and filtering properties very powerful; it is of great value in sugar refining.

Flotation Processes.—Oil and other flotation processes have be applied for the recovery of clean coal from coal residues and also separating molybdenite and various metals from their ores.

Deposits.—The location of ore deposits by means of electric nagnetic apparatus has also received a great deal of attention.

inless Steel.—There have been many inventions for improving nanufacture of the chrome-steel alloy used in making stainless (*see* RUSTLESS STEEL) for cutlery and other articles; a very tly proposed use of stainless steel is for making the metal gs of road vehicles.

ohol.—For obtaining methylic and higher alcohols (*see* ALCO- from carbonic oxide and hydrogen, the Badische Anilin und Fabrik has brought into use processes similar to their high- ure processes for the synthetic production of ammonia. e same company is also experimenting with processes for con- g coal into oil (*see* FUEL PROBLEMS).

ficial Silk.—Many inventions for improving the manufacture ficial silk (*q.v.*) have been patented. The dyeing (*q.v.*) of acetate he artificial silk usually called celanese, by the use of ionamines y adding a protective colloid, which may be obtained by grind- insoluble dye with sodium sulphoricinoleate, to the dye baths ceived attention during the past few years.

ber Processes.—There have been many inventions for the use elerators capable of powerful action in the vulcanising process UBBER), *e.g.*, aldehydes, amines and *p*-nitroso dimethylaniline. reatment of rubber latex which has been delivered in large ities by the rubber producing companies, has received a great f attention. A recent invention (Hopkinson's British Specifi- No. 157978) is for spraying the latex so as to atomize it; the in the sprayed latex is evaporated and crude rubber remains.

ficial Foods.—Many inventions relate to the production of ial foods containing large percentages of vitamins (*q.v.*) selected our healthy development or to counteract tendencies towards s, beri-beri and other diseases. Many of the vitamins intro- are of the fat-soluble A (cod-liver oil) type or of the water- e B (yeast) type.

of the most active subjects of invention has been the manu- e of artificial limbs, the efficiency and value of which have been erable. Destructible receptacles, intended for use once only roduced in vast numbers at a low cost have been patented in forms. These receptacles, for use in serving jellies, ices, etc. de of cardboard or other cheap material.

tography.—Photographic surveying from aircraft, employed during the War, has been utilised for topographic surveying. ethod has been found by archaeologists to be useful in discover- nd investigating traces of ancient encampments and other nents, for the views obtained show details not visible at close rs (*see* ARCHAEOLOGY: AIR SURVEY). Prof. Sir J. B. Hender- gyroscopically controlled camera has been designed chiefly on aeroplanes.

(T. E. L.)

A (*see* 14.732).—The population of Iowa according to the census was 2,419,927 on July 1 1925, as against 2,404,021 o and 2,224,771 in 1910. In 1920 the native whites of parentage numbered 1,528,553; those of foreign or mixed tage, 629,981; and the foreign-born whites, 225,647. The population was 19,005. There were in 1920 43·2 inhabi- per square mile as against 40 in 1910. In 1920 the urban popu- was 36·4% of the whole. There were seven cities having a ation of over 25,000 as follows:—

	1920	1910	Increase %
Moines	126,468	86,368	46·4
x City	71,227	47,828	48·9
enport	56,727	43,028	31·8
ar Rapids	45,566	32,811	38·9
uque	39,141	38,494	1·7
erloo	36,230	26,693	35·7
ncil Bluffs	36,162	29,292	23·5

iculture.—In 1925 the aggregate crop acreage in Iowa was ,893 and the value of the farm lands and buildings was ,427,734. In 1924 Iowa was first among the states in the ge, production and total value of both corn and oats. Iowa's crop in 1909 was 341,750,460 bu., valued at $167,622,834, ,229,378 ac.; in 1924, 304,752,000 bu., valued at 283,419,- om 10,884,000 acres. The number of cattle on Iowa farms 5 was approximately 4,507,000, of horses 1,229,000 and ep 891,000; while in the number of swine Iowa increased 7,545,853 in 1910 to 10,539,000 in 1924, but decreased to 000 in 1925.

nufactures, Mining and Transportation.—Meat-packing ues to lead manufacturing industries, the value of prod- f slaughtering and meat-packing having increased from 3,482 in 1909 to $152,631,945 in 1923. The second industry in value of products in 1923 was butter. In 1909 this product was valued at $24,440,715 and in 1923 at $67,972,113. Food preparations, including cereals and breakfast foods, were third, the value of these products increasing from $9,795,000 in 1909 to $37,698,210 in 1923. The value of all manufactured products was $259,237,637 in 1909; $690,042,714 in 1923. The most important mineral product in Iowa is bituminous coal; in 1910 the value was $12,682,106; in 1919 $16,903,358; in 1922 $16,119,000. The value of clay and clay products in 1919 was $8,127,000. Portland cement and gypsum products were also prominent. The railway mileage was 9,781.65 in 1910 and 9,843 in 1924. The mileage of interurban electric lines has increased from 373·92 to 946·49, or about 153%.

Education.—The Federal census of 1910 credited Iowa with the smallest percentage of illiteracy of any state in the Union (1·7 %.) In 1920, with a percentage of 1·1% it still maintained first place. State aid became an important factor in the development of public schools in the period following 1910. Legislation granted such aid to large, centrally located, consolidated schools, which replaced small scattered ones. At the close of 1920 there were 430 consolidated districts, including about 25% of the area of the state and taking care of approximately 50,000 pupils. In 1911 state aid was granted by law to high schools organising normal training of rural teachers of which schools there were, in 1918, 172. In 1917 a state board for vocational education was established to take advantage of the provisions of the Smith-Hughes Act offering Federal aid for vocational education. A law, enacted in 1919, provided for part-time schools for the benefit of children between the ages of 14 and 16 working on employment certificates. The establishment of these schools was required where there were 15 eligible pupils in the district, and attendance became compulsory.

Legislation.—The only constitutional change made during the period 1910–25 was an amendment ratified by the people in 1916 fixing the time of the general election for that year on the same day as the presidential election, the time of election thereafter to be determined by the General Assembly. In 1916 a constitutional amendment extending suffrage to women was submitted to the electors but was defeated. The Federal suffrage amendment was adopted in 1920. The vital portions of the "mulct tax" law of 1894 (*see* 14.734) were repealed by the General Assembly in 1915, thus restoring statutory prohibition in Iowa, but a prohibitory amendment to the state constitution was voted down by the electors in Oct. 1917. The Eighteenth (Prohibition) Federal Amendment was however ratified by Iowa Jan. 15 1919. The constitution of 1857 provided that in 1870 and every ten years thereafter the question, "Shall there be a Convention to revise the Constitution and amend the same?" should be submitted to a vote of the electors of the state, and in case of a favourable vote the General Assembly should provide by law for the election of delegates. In the election of 1920, for the first time, the vote showed a majority in favour of a convention.

The General Assembly in 1913 passed an Employers' Liability and Workmen's Compensation Act; and at the same session a Mothers' Pension Act was passed, providing for the granting to widowed and indigent mothers of sums not to exceed $2 per week for each child under 14 years of age. In 1915 the Perkins law was passed, providing free treatment for crippled children of poor parents. In 1917 an appropriation was made by the General Assembly for the erection and equipment of a hospital at Iowa City for such children. Two years later the General Assembly provided that adults as well might be sent to Iowa City for free medical and surgical treatment. In 1917 the General Assembly established at Iowa City a child-welfare station for the consideration of conditions and measures.

An important development was the farm bureau movement. By 1917 organisations among farmers in the state were numerous, and in that year the General Assembly passed an Act providing that where a farm-improvement association in any county had among its members 200 farmers or farm owners and had raised $500 in annual subscriptions, the county board of supervisors was authorised to contribute $2,500 for the employment of a county agent. A law in 1919 modified the amount and terms of the payment by the county and made the contribution mandatory. The movement gained rapid headway, county associations being established for the betterment of both social and economic conditions and the improvement of agricultural methods. In 1920 there was a farm bureau in each county and two in Pottawattamie county, and a membership of over 100,000. There was also a considerable growth within the state of a farmers' educational and co-operative union which had over 20,000 members in 1920.

Government and Finances.—The commission plan of government, authorised in 1907 for cities of 25,000 or more inhabitants, was extended to cities of 2,000 or more inhabitants. By 1920, nine cities had organised under the commission plan: Burlington, Cedar Rapids, Des Moines, Fort Dodge, Keokuk, Marshalltown, Mason City, Ottumwa and Sioux City. In 1915 the General Assembly passed Acts allowing cities to organise their municipal government under city-manager plans, but they have not been generally taken advantage of. The General Assembly in 1913 provided that Supreme, District and Superior Court judges should be nominated and elected on a non-partisan ticket, but in 1919 the nomination and election of judges was restored to a party basis.

In 1911 the office of commerce counsel was created, the incumbent to be appointed by the Board of Railway Commissioners and to serve as expert counsel for that board. In 1913 the Department of Insurance was created, and in 1917 a state Banking Department was organised and the office of Superintendent of Banking created. In 1915 a state Board of Audit and a state Board of Accountancy were created, and the office of Document Editor was established to relieve the Secretary of State. The road administration was reorganised in 1913 when the General Assembly established a highway commission consisting of the dean of engineering of the State College of Agriculture and Mechanic Arts and two appointive members. Highway legislation in 1919 divided the highways into primary and secondary systems, and arranged for the distribution of Federal and state aid funds for the hard surfacing of primary roads.

In 1923 the assessed valuation of property in Iowa was $1,766,329,861 on which were levied taxes amounting to $12,523,228 ($5.09 *per capita*). The funded and floating debt of the state was $11,797,100; the net debt was $11,715,131 ($4.76 *per capita*).

History.—The history of Iowa in the years 1910–25 was marked by no economic or political changes of great importance. The state remained predominantly agricultural. Although its manufactures increased in importance, it was little disturbed by industrial controversies. The supremacy of the Republican party in politics was not seriously questioned. Owing to a split in the Republican party in 1912, the Democratic candidate for President received the electoral vote of Iowa, but the state returned to the Republican ranks in 1916, and in 1920 cast an overwhelming vote for Harding for President and for Nathan E. Kendall for governor. Throughout the period U.S. Senator Albert B. Cummins continued to represent the state. The death of Senator Jonathan P. Dolliver in 1910 caused a vacancy, filled temporarily by the appointment of LaFayette Young. In 1911, William S. Kenyon was chosen to fill the position; he was reelected in 1913 and 1918. In 1920, Albert B. Cummins was again elected to the Senate, for the term ending March 4 1927. On Feb. 24 1922, William S. Kenyon resigned his office of Senator, Gov. Kendall appointing Charles A. Rawson of Des Moines to fill the vacancy until the next election. At the primary election held in June 1922, Smith W. Brookhart of Washington, Iowa, was chosen as the Rupublican candidate, and at the general election following was elected for the unexpired term. In 1924, Mr. Brookhart was nominated and elected for the term ending March 4 1931. Republican governors were elected or re-elected every two years, incumbents being: Beryl F. Carroll, 1909–13; George W. Clarke, 1913–7; William L. Harding, 1917–21; Nathan E. Kendall, 1921–5; John Hammill, 1925–

'IRAQ (*see* MESOPOTAMIA, 18.179), a mandated Arab king in Asia Minor embracing the former Turkish vilayets of Bagh Basra and Mosul. Area 143,250 square miles. Population 2,8 282 (1920). 'Iraq is bounded on the west by Transjordan, the southwest by Arabia, on the south by a neutral zone, on southeast by Al Kuwait and the Persian Gulf, on the east by sia, on the north by Turkey and on the northwest by Syria. British Empire is the Mandatory Power.

The terms of the mandate were never formally laid down the League of Nations, but the relations between Great Bri and 'Iraq were defined in a treaty concluded on Oct. 10 1 and ratified on Dec. 19 1925. On Sept. 24 1924 the League cepted this definition as giving effect to the provisions of Art. of the Covenant. The period of the treaty was extended 20 years by a subsequent treaty executed on Jan. 13 1926, ratified on March 30 1926. The 'Iraq Govt. is a limited m archy on the Egyptian model, with a King, a senate of 20 n inated members and a lower house of 88 deputies. The coun is divided into 12 liwas. The administration is in the hand the 'Iraq Govt., represented in each liwa by a Mutasarrif wh assisted by a British official with advisory powers. The 12 li are Mosul, Erbil, Kirkuk, Sulaimaniya, Diyala, Baghdad, laim, Kut, Karbala, Hilla, Ad Diwaniya, Muntafiq and Bas

I. POLITICAL HISTORY

Nationalist Movement.—During the years from 1911 up to outbreak of the World War, the Ottoman régime in the dist Mesopotamian vilayets showed marked deterioration. The hope that any efficient administrative system might be est lished in Mesopotamia vanished with the fall in 1911 of N Pasha, an energetic man of singular integrity, who had set self to the intricate task before him with all the rude strengt a Turkish soldier of the old order. The Italian and Balkan had weakened the central Government, while in the Arab pr inces, in particular, the disappointment of hopes born of constitution of 1908 was leading to a recrudescence of ra aspirations. Damascus and Beirut had long been centres nationalist movements, but already, at the end of 1913, the sc society called the Ahd (the league) embraced the three Mes tamian vilayets as well as Syria. A prominent figure in the m ment was Saiyid Talib Pasha of Basra. He had reached stage in his career when nationalist enthusiasm seemed best culated to serve his ambitions. He had, however, exhaust Turkish patience, and steps were about to be taken to dispo him in true Turkish fashion when War was declared on Oc 1914. Talib approached Sir Percy Cox, and offered to raise Arab revolt in return for recognition as an autonomous local ch The reply was not satisfactory; he fled to Al Kuwait, and the to Ibn Sa'ud, who interceded for him. He ended by going India, in voluntary exile, and, in 1917, was permitted to move Egypt, where he remained till his return to Basra in Feb. 19

The Mesopotamian Campaign.—The declaration of war followed on Oct. 31 1914 by a proclamation by the Politi Resident in the Persian Gulf to local Arab rulers explaining t Turkey had entered the War at the instigation of Germany promising the chiefs who had enjoyed the protection of Gr Britain that no act of that country should threaten liberty religion. With these assurances the princes of the Gulf w satisfied. Before military operations had begun, Sir Percy C whose efforts had consolidated the British position in the G joined the army concentrated at Bahrein as Chief Politi Officer. On Nov. 6, when the British took Fao fort, he iss a second proclamation repeating the assurances already giv

A determined attempt was made by the Ottoman Govt. rouse fanaticism by preaching a *Jihad*, but the tribesmen gave Turks less than half-hearted support. By Nov. 21 the Turks abandoned Basra; the British position on the Shatt-al-

cured, and the refinery of the Anglo-Persian Oil Company
ıadan was safe. On Nov. 22 British troops entered Basra
ı the name of the general officer commanding-in chief, Sir
Cox published a third proclamation assuring the inhabi-
that Turkish rule was dead and that Great Britain was
good friend and protector. The British arrival at Basra
reeted with acclamation by the terror-stricken popu-
ivil administration was set up under the G.O.C., with Sir
Cox as Chief Political Officer. As success followed success,
measure of law and order followed in the wake of the arm-
he administration was well served by the revenue com-
ner, Mr. Dobbs, now Sir Henry Dobbs, who made the first
of agrarian conditions. His profound knowledge of tribal
n enabled him to discern and account for agrarian phenom-
ıd the accompanying tribal unrest and, not least, to draw
tribal criminal disputes regulations, on a model which had
d with success on the Indian frontier, thus solving the prob-
administering to tribesmen justice which should be ade-
and also comprehensible to their primitive understanding.
advance from Basra to Baghdad is described under
POTAMIA. A period of grave anxiety preceded the victory
ı'aiba, on April 12 1915, when a reverse would have en,
the annihilation of the Indian Expeditionary Force "D.',
the retreat from Ctesiphon, Nov. 25 1915, and the fall of
n April 29 1916, the fate of 'Iraq hung in the balance, but
organisation of the force under General Maude laid the foun-
ıs of victory, and Baghdad was occupied on March 11 1917.
he proclamation which General Maude issued upon the occu-
ı of Baghdad a definite promise was given that alien in-
ions should not be imposed, that Arab aspirations should be
ed and that on those grounds the collaboration with British
cal officials of Arab nobles, elders and representatives was
ed. A further development of civil administration was
when in July 1917, Sir Percy Cox was appointed Civil Com-
ner. The country suffered great loss in the death in Nov.
of General Maude, whose distinguished powers as a military
had earned the respect and admiration of 'Iraqis, but
General Marshall the success of British arms was carried on.
n Nov. 1917 the northern Euphrates was occupied up to
di, and in March 1918 up to 'Ana. In the same month, a
s incident occurred on the middle Euphrates. The holy
of Karbala and An Najaf were not only racked by internal
but both they and the adjacent tribesmen owned the sway
sian divines to whom the secular interests of 'Iraq counted
ıg. In the first years the British government of occupation
rtunate in finding in the recognised leader of these Mujtahids
of singular personality who, while consistently refusing
to give open advice on political questions, tacitly backed the Power which had been placed in command by the vicissitudes of war. Nevertheless, the holy towns presented a fertile field for intrigue, and when the government of occupation showed a determination to check the rapacity of the local chiefs of An Najaf, a plot, engineered from without, came to a sudden head with the murder of the newly appointed assistant political officer.

Sir Percy Cox was on his way home to attend a conference in London, but the situation was handled successfully by Colonel Wilson, afterwards Sir A. T. Wilson, who was in charge. He was aided by the universal condemnation of the An Najaf rebels by public opinion elsewhere and by the friendly relations which were maintained with the chief Mujtahid. Though An Najaf was blockaded, not a shot was fired; but the pressure exerted resulted in the handing over of the guilty by May 1. A court of specially qualified officers condemned 13 of the men to death. Over 100 persons were sentenced to transportation for life or for shorter periods, but all these have since been permitted to return.

Northeast of Baghdad, progress was hindered by the Russian débacle, but when, at the end of June 1917, the upheaval which was taking place in Russia obliged the Russians to retire, the British force gradually drove the Turks from the vacated positions, occupying Khanaqin in Dec. 1917, and Kifri in April 1918. The first task of the British administration was to save these provinces from the destitution and famine into which they had been plunged by the flux and reflux of Turkish and Russian armies, but again the British advance was impeded by the rapid dissolution of the Russian forces in Persia and the necessity of guarding northern Persia from Turkish attack. It was the more unfortunate, as nowhere was the establishment of administration effected more smoothly than among the Kurdish and Turkoman elements with which the British forces now came into touch. Kirkuk was reached in May, and immediately a provisional government under a local magnate, Shaikh Mahmud al Barzanji, was set up voluntarily in Sulaimaniya in friendly co-operation with the British. But the exigencies of the Persian situation made it impossible for the General Staff to maintain the position so easily acquired; the British, accompanied by a large number of the Christian population, abandoned Kirkuk, which was not reoccupied until the final advance, in Oct. 1918, ended in the occupation of the whole of the Mosul vilayet.

Liberation of 'Iraq.—On Nov. 7 1918, 10 days after the signature of the Turkish armistice at Mudros, the British and French governments issued a joint declaration of vital importance to the occupied Arab territories, stating their aims in the East to be:—

> The complete and final enfranchisement of the peoples so long oppressed by the Turks, and the establishment of national governments and administrations drawing their authority from the initiative and free choice of native populations.

The proclamation went on to promise encouragement and help in the establishment of native governments and administrations in Syria and Mesopotamia. General Maude's pronouncement had been made while the upshot of war was still doubtful, and was therefore discounted as a natural mode of propaganda, whereas the Anglo-French declaration was published after victory had been achieved. Together with President Wilson's Fourteen Points, it gave unbridled play to political speculation, which was further encouraged when the British Govt. directed Colonel Wilson to hold an inquiry as to whether the people of 'Iraq were in favour of a united Arab State from the northern boundary of the Mosul vilayet to the Persian Gulf under British tutelage, whether they desired that this state should be placed under an Arab Amir and if so whom would they suggest. In the light of experience it can safely be said that public opinion was not ripe to reply to these questions which, in the provinces, at any rate, were nothing but a bewilderment to tribesmen, landowners and cultivators. Save on the first point, which was unanimously approved, no definite answer was given. In Baghdad the representative Moslems assembled by the Sunni and Shi'ah Qadhis asked for an Arab State under a son of the Sharif Hussein. Elsewhere every variety of reply was given.

No action could be taken on replies so conflicting, but during the year 1919 some progress was made towards the appointment of local subordinates in an advisory capacity. Other factors had, however, come into play. The first of these was the establishment of an independent Arab State in Syria, largely the handiwork of a number of eager and adventurous ‘Iraqis who were anxious to return home and enjoy the same powers as those of which they stood possessed in Damascus or Aleppo. They carried on an active propaganda in ‘Iraq, and when, in March 1920, the Amir Faisal was proclaimed King of Syria they responded by electing the Amir ‘Abdullah King of ‘Iraq.

The movement in ‘Iraq which led to the rebellion of 1920 was part of a general resentment against the policy of the British and their allies. In India, Persia, Egypt and Turkey, no less than in Syria and ‘Iraq, a crisis was reached during the years 1919 and 1920, and the political credit of Great Britain fell low in the Eastern world. ‘Iraq was in the centre of this hostile vortex, and was specially affected by the Persian Shi‘ah divines, who were domiciled in the holy towns but were responsive to every shade of feeling in their own country. While the administration was still patently alien, British forces had been cut down to a minimum, and when, in May 1920, the British Govt. announced their acceptance from the League of Nations of a mandate over ‘Iraq, the Damascus Govt. had already, in the absence of the Amir Faisal and contrary to his orders, begun its encroachments. In answer to objections raised against the mandate by a self-chosen committee in Baghdad, it was announced (June 20) that Sir Percy Cox would return in the autumn to establish a provisional Arab Govt. and call an Assembly, freely elected by the people, in consultation with which he would prepare an organic law. But nothing would then have satisfied the claims of the Nationalist leaders, and on July 2 1920, the turbulent Shi‘ah tribes, encouraged by their religious leaders, broke into open revolt.

To restore peace and order was the first necessity. Troops were drafted in from India, and when Sir P. Cox reached Basra (Oct. 1), as High Commissioner, the rebellion in its main centres, the middle Euphrates, the Diyala and the adjacent part of Kirkuk district was already doomed to failure. By Nov. 10, a provisional Council of State was formed under the Naqib of Baghdad. It included Saiyid Talib Pasha as Minister of Interior, Sasun Effendi Haskail, the best known member of the Jewish community, as Minister of Finance, and Ja‘far Pasha al ‘Askari, distinguished for his services during the War and in the Syrian administration of King Faisal, as Minister of Defence. The Council of State, some of the members of which were without portfolios, represented all classes and sects of society; at its request some of the leaders of the rebellion who had been interned at Henjam were released at once. It gave immediate attention to the repatriation of ‘Iraqi officers from Syria and the Hejaz; to the reorganisation of civil government under ‘Iraqi officials, greatly facilitated by the return of many experienced men from Turkey; and to the preparation of an electoral law and the formation of an army. It was the arrival of ‘Iraqi officers who had served under the Amir Faisal which set on foot a movement in his favour in ‘Iraq. He had been driven from Syria in July 1920, and had since resided in England. To this movement Saiyid Talib was opposed, and during the absence of Sir Percy Cox in Feb. and March 1921, to attend the conference summoned at Cairo by Mr. Winston Churchill, Saiyid Talib's ambitions developed, and he assumed a menacing attitude towards the British efforts to secure a free discussion of the future government of ‘Iraq by its people. In April, after a direct threat on the part of the Saiyid, the High Commissioner secured his deportation to Ceylon, and the political atmosphere cleared.

The first result of the Cairo Conference was the publication of a general amnesty in May, and at the same time an attempt was made to ascertain the wishes of the Kurdish provinces as to their inclusion in the ‘Iraq State. The net result was that Sulamaniya remained under the control of the High Commission, but the rest of the Kurdish population was content with the promise of Kurdish officials, under the ‘Iraq Govt., and the local use of the Kurdish language.

Choice of a King.—Towards the end of June, the Amir F arrived in Baghdad, as a candidate for the throne. This c dature was known to be acceptable to the British Govt., an July 11, the Council of Ministers passed a resolution declaring King of ‘Iraq, on condition that his government shoul constitutional, representative and democratic. But Sir P Cox fortified himself by consulting the people, and a referen was carried out, through the Ministry of Interior, throug the country, with the exception of Sulaimaniya, with the r that 96% of the votes were cast in favour of the Amir F outside Baghdad most of the townships and districts stipul for the continuance of the British mandate. The Amir crowned on Aug. 23 1921, and entrusted the Naqib with formation of his first cabinet.

Troubles on Turkish and Arabian Frontiers.—The early of King Faisal's reign were troubled without and within. the north, Turkish nationalism had taken a turn distinctly tile to ‘Iraq. Turkish garrisons on the frontier had incre the tribes were flooded with propaganda, and a Turkish o with a small party of irregulars had occupied Ruwāndiz in 1921. From that advantageous position the Turks kept whole of southern Kurdistan in a ferment till they were fi ejected in the spring of 1923. Turbulent chieftains roused of the tribes of Sulaimaniya in the spring of 1922, and a ge cry was started for the return of Shaikh Mahmud, who had defeated by the British and deported in 1919. The B administration evacuated the province in 1922, and S Mahmud was reinstalled in the autumn, under binding a ances that he would be loyal to the British and ‘Iraq go ments. He entered at once into correspondence with the T

On the Arabian frontier, since the beginning of 1921, the o tions of Ibn Sa‘ud against Ibn Rashid had profoundly dist the tribes. As early as April 1921, the Shammar of Ibn R began to seek safety in ‘Iraq where a large section of the resides. Their presence embittered relations between and Nejd, and after the fall of Ibn Rashid's capital, Ha Nov. 1921, Ibn Sa‘ud's pretensions increased, and he cl the allegiance of the ‘Anizah on the eastern side of the S desert, who had always been attached to ‘Iraq. In M 1922 he permitted the leaders of his Akhwan, or Brethr attack the ‘Iraq desert camel corps and the shepherd grazing under its protection about 30 m. south of the ra between Baghdad and Basra. Heavy loss was inflicted.

Anti-mandate Agitation and the Preliminaries of the Treaty.—These dangers on the frontiers coincided with a s divergence of views between the British and ‘Iraq governme to the nature of their relations with one another. King Fais his Prime Minister asked for the complete abrogation o mandate and its substitution by a treaty of alliance, wh the British Govt. were aiming at a treaty within the scope mandate. The difference was largely technical, but it gav to grave misunderstandings and embittered controversy. I alleged that the attack by Ibn Sa‘ud, who was at that ti receipt of a subsidy from Great Britain, had been instigate the latter in order to show the ‘Iraq Govt. its weakness. A point the Shi‘ah divines took a hand in the matter and summ a conference at Karbalā, nominally to consider measures fence against the Akhwan, but with the underlying obje protesting against the British mandate. The conference a bled, but the Sunni shaikhs held off, the wiser among the Sh nipped any subsidiary intentions in the bud, and the meetin fined itself to petitioning King Faisal to take steps again Akhwan. But the heat engendered was not extinguished anti-mandate agitation continued through the summer, th in June the Council of Ministers accepted the treaty with Britain, subject to its acceptance by the Constituent Asse On Aug. 16 the Cabinet resigned, and Sir Percy Cox, wh tending a levee, was greeted by an anti-mandate demonstr He demanded and received an instant apology, but at the moment it was announced that King Faisal was struck do a dangerous attack of appendicitis, and an immediate tion was necessary.

ıs. by a singular combination of circumstances, the country
ft with no authority but that of the High Commissioner.
sued a proclamation explaining the situation, arrested and
ted certain agitators, and induced two of the Shi‘ah divines
ve voluntarily for Persia. By Sept. 10 1922 the agitation
ied out. On Oct. 10 1922 Sir Percy Cox and the Naqib
l a treaty of alliance between Great Britain and the ‘Iraqi
years (British Treaty Series No. 2), but ratification was
ed and negotiations over the subsidiary agreements dragged
til 1924.

sooner was the internal situation stabilised than the north-
n frontier again demanded attention. With Shaikh Mah-
n Sulaimaniya and the Turks in Ruwāndiz and its neigh-
ood, effective administration had ceased east of Erbil,
k and Kifri. In Oct. 1922 a measure decided on at the
Conference was put into force and the Air Marshal, Sir
Salmond, assumed charge of all imperial forces in ‘Iraq,
d troops, levies and air force. By his vigorous action he
l the Turks to retire to Ruwāndiz. But the autumn of 1922
he period of Mustafa Kemal's great triumph over the
s. It influenced both the Shi‘ahs of the Euphrates and the
of the north. On Oct. 21 1922 the King issued an Iradah
ng elections for the Constituent Assembly to begin; it was
ered by a fatwah, signed by the Shi‘ah divines of Karbala
adhimain forbidding participation in elections. In Nov.
aqib resigned, and ‘Abdul Muhsin Beg al Sa‘dun formed
Cabinet. In the same month elections were held in Great
in, during which a campaign was conducted against the
ent of the pledges to ‘Iraq. Mr. Bonar Law's Cabinet
in under obligation to consider the question, and Sir Percy
vas summoned to London in Jan. 1923, to take part in the
sion. He left in charge Sir Henry Dobbs who had come
s Counsellor in the previous December. The position of
ritish Govt. was extremely difficult. A solution was found
e reduction of the term of the yet unratified treaty
20 to a maximum of four years after the ratification of
with Turkey,[1] with the prospect of renewal at the end of
eriod. The treaty would lapse in the event of ‘Iraq be-
g a member of the League of Nations. The protocol em-
ng this agreement was brought back by Sir Percy Cox on
h 31 1923, and signed on April 30. Sir Henry Dobbs,
had acted since January, became High Commissioner in
1923.

rations in Mosul.—Meantime, in March 1923, Sir Henry
he Air Marshal had been obliged to take steps against the
sh threat in the north. The Amir Zaid, who had arrived in
lad in the previous autumn, went to Mosul, where he su-
tended the formation of a force of Arab irregulars to oper-
the plains if necessary. The strong stand taken by Lord
on at Lausanne reacted on ‘Iraq. Shaikh Mahmud, who
n league with the Turkish band at Ruwāndiz, was dealt
and in April, by a brilliant military movement, supported
r action, the Turks were ejected from Ruwāndiz, and a
ish chief put in as Qaimmaqam under the Mutasarrif of
. With a force of Assyrian levies behind him, Saiyid Taha
losed Ruwāndiz to Turkish influences. Though it was found
ssible to set up a local administration in Sulaimaniya, the
ing parts were placed under the ‘Iraq administration and
h Mahmud was allowed to return to Sulaimaniya town
he mountains between the town and the Persian frontier,
1924 his intrigues made it necessary to eject him from
maniya town. This was done by a column of the ‘Iraq
, with levies and air force support; the Sulaimaniya liwa
ncluded in ‘Iraq in March 1924, and sent representatives
Constituent Assembly. Shaikh Mahmud, with small rob-
ands, was still lurking on the frontier at the close of 1925;
d incurred the hostility of the Persian Govt. as well as
of the Govt. of ‘Iraq.

Elections.—In July 1923, King Faisal authorised his
nment to deport the chief obstructionist among the Shi‘ah
s, Shaikh Mahdi al Khalisi. This act was followed by the voluntary exodus to Persia of a number of other religious leaders, all Persian subjects. They were allowed to return after the Constituent Assembly had ratified the treaty, and have since passed out of political history. After its decisive handling of the Mujtahids, for which the ‘Iraq Govt. deserves the greatest credit, the elections went forward without a hitch. From the Kurdish mountains to the Persian Gulf, primary electors enrolled themselves with surprising alacrity, and, in marked contrast to their practice in Turkish times, the tribal chiefs pressed their followers to come forward in great numbers. Secondary elections began in Feb. 1924, and all results were declared by the middle of March.

Settlement with Nejd.—During the winter of 1923–4 an attempt was made to settle the growing differences between ‘Iraq and Nejd by a conference of representatives held at Al Kuwait under Colonel Knox. The main point of difference was the repatriation of Nejd tribes which had taken refuge in ‘Iraq. The ‘Iraq representatives rightly pointed out that, apart from the violation of tribal custom involved, they had not the requisite force to constrain these unwelcome guests to return to their own country, but they agreed to abide by stipulations considered satisfactory by the British Government. Though on lesser matters agreement was reached, Ibn Sa‘ud proved obdurate on the major issue, and just as the conference was about to reassemble in March 1924, his followers carried out a brutal raid on the ‘Iraq shepherd tribes. The conference thereupon broke up. Other raids occurred during 1924–5, and, as a result, the ‘Iraq Govt. made a determined effort to remove the tribes from the vicinity of the frontier and Ibn Sa‘ud gave orders to his Akhwan leaders to discontinue raiding. Finally, at the conference held at Bahra in the Hejaz between the Sultan and Sir Gilbert Clayton, in Nov. 1925, a treaty was drawn up between ‘Iraq and Nejd on the lines proposed by H. M. Govt. and the ‘Iraq Govt. at Al Kuwait.

Ratification of the Treaty.—Sir Henry Dobbs and the ‘Iraq Govt. had been engaged during the winter of 1923 in discussing the provisions of the agreements subsidiary to the treaty. The resignation of ‘Abdul Muhsin Beg, in Nov. 1923, occurred in the midst of these discussions, which were carried on with the new Cabinet presided over by Ja‘far Pasha al ‘Askari. The agreements were signed on March 25 1924, and the instrument of alliance being thus complete, the Constituent Assembly was opened by the King on March 27.

The debates on the treaty and agreements continued until June 10. There was much misrepresentation and some solid ground for dissatisfaction at the heavy burdens imposed on ‘Iraq by the obligation simultaneously to expand the army, redeem the capital cost of the railways and shoulder a large share of the Ottoman Debt. H. M. Govt. gave an undertaking that after the ratification of the treaty they would be prepared to reconsider certain of the financial obligations of ‘Iraq towards Great Britain, and the debates were brought to a close by the announcement of the determination of the British Govt. to raise before the League of Nations at the June session the whole question of the continuance of their mandate, and the warning that if the Assembly had not passed the treaty by June 10, it would be taken as a rejection. King Faisal and his government clearly discerned the attendant risks, the Cabinet called on its followers for support, and the treaty and agreements were accepted before midnight on the appointed date. The instrument was accepted by the League of Nations on Sept. 27 1924, as giving effect to the provisions of Art. 22 of the Covenant of the League for the regulation of the relations between ‘Iraq and the mandatory Power, and was ratified by King George and King Faisal in the winter of 1924. The Constituent Assembly then passed the Organic and Electoral Laws, and was dissolved on Aug. 2 1924. Ja‘far Pasha and his Cabinet having concluded their work, resigned office, and Yasin Pasha al Hashimi formed a new Cabinet.

The question which now overshadowed all others was the settlement of the northern frontier with Turkey. (*See* LEAGUE OF NATIONS; MOSUL.)

It had not been considered advisable to disturb the proceedings of the Frontier Commission sent by the League of Nations to Mosul in the spring of 1925 by the holding of elections; on

---

[1] This took place on Aug. 6 1924.

March 21 1925, however, the Organic Law was promulgated and elections for the first parliament began. Yasin Pasha's Cabinet had previously passed four notable measures, vital for the further prosperity and stability of ‘Iraq. The first was the signature with the Anglo-Persian Oil Company of an agreement for the dredging of the Shattal-‘Arab bar. The second was a trade transit agreement with Syria. The third was the granting to an international group, known as the Turkish Petroleum Company, of a concession for the development of oil in the Baghdad and Mosul vilayets, while the fourth was the signature of long term contracts with over a hundred experienced British advisers and officials.

The visit in April 1925 of the Secretaries of State for the Colonies and Air gave opportunities for frank and valuable exchange of views, and also resulted in the adoption of a scheme which should provide for the speedier training of the ‘Iraq army, so that it might eventually assume responsibility for internal security and external defence.

Elections were completed by June 23 1925, but before parliament met Yasin Pasha resigned, owing to differences of opinion in his Cabinet, and ‘Abdul Muhsin Beg was again charged with the formation of a government. Parliament, consisting of two chambers, a Senate of 20 members, appointed by King Faisal, and an elected house of 88 members, met on July 16 in extraordinary session to consider the budget and certain necessary amendments to the Organic Law. Its debates were characterised by earnestness and good sense, and when its task was finished it was prorogued, on Oct. 28, by the Amir Zaid, acting as Regent during King Faisal's absence. The second session was opened formally on Nov. 1, but was postponed for six weeks and met definitely on Dec. 20.

The New Treaty.—The settlement of the question of Mosul (*see* LEAGUE OF NATIONS) was accepted by ‘Iraq with relief, and negotiations for the signature of the new treaty were initiated before the end of 1925. The treaty was signed by the representatives of the two governments on Jan. 13 1926, and accepted by the ‘Iraq Parliament on Jan. 18 and by the British Parliament on Feb. 18. It is contracted for a maximum period of 25 years or until ‘Iraq shall be permitted to become a member of the League of Nations. When the delimitation of the northern frontier along the Brussels line and of the Syrian frontier, which is as yet only provisionally fixed, has been completed, it will remain for ‘Iraq to satisfy the League that the conditions of membership laid down in Article I of the Covenant have been fulfilled. The arrangement was not accepted by the Turks until June, 1926. (*See* MOSUL.)

Since 1920 great progress has been made in this direction. A police force, which compares favourably with any in the East, does its part in preserving internal order; a body of responsible ‘Iraq civil officials is coming into being; communication by rail and road are opening up the country, the trans-desert route, in particular, having brought ‘Iraqi into much closer touch with Syria, Egypt and Europe; the tribal leaders are stepping into their place in public life, thus tending to reduce the former gulf between tribesmen and the effendis of the town. Justice is on the whole satisfactorily administered; the Ottoman Law still remains the principal system of law in use in the civil courts, while the criminal codes are founded on those of Egypt and the Sudan. Good hospitals exist in Baghdad, Basra and Mosul and smaller establishments in other provincial towns; the Baghdad hospital is as well equipped as any in Asia and is able to deal with and stamp out recurrent epidemics. Education has perhaps seen the greatest revolution since Turkish times. Arabic is now the medium of instruction, or the local vernacular in Kurdish or Turkoman districts. Great efforts have been made to provide a sound grounding. Four secondary schools are all that the Government can yet afford, but teachers are being trained, recruits engaged in Syria and the quality of education shows a marked improvement. The desert route has enabled many boys to seek higher education abroad. The agricultural department is raising the level of husbandry by providing selected seeds and has given special attention to the growing of cotton, which bids fair to become one of the most valuable crops of the country.

II. FINANCIAL AND ECONOMIC HISTORY

The truth about the public revenue and expenditure of ‘ is very hard to determine. Figures dating back to the peri Ottoman rule bear small resemblance to fact, and during War period fancy played a large part in the preparation of fig relating to the “civil administration.” To draw a distin during that period between military and civil expenditure, tween the activities of the Expeditionary Force and those o Civil Service, and to analyse the respective liabilities of the perial Govt., the Government of India and the civil adminis tion of Mesopotamia were tasks which provided abun exercise for a lively imagination.

Revenue and Expenditure.—The average revenue during two years 1910–2 was made by the Treaty of Lausanne the termining factor in ‘Iraq's liability for the Ottoman P Debt, and the total figure for the three vilayets of Bagh Basra and Mosul was £T. 1,492,953. ‘Iraq was no source profit to the Ottoman Empire. Basra, in spite of a comp lack of harbour facilities, was an important gateway, and cust receipts there were heavy. But ‘Iraq was to all intents and p poses a foreign dependency in which other revenues were collected by means of minor military operations, the cos which exceeded their proceeds.

The Review of the civil administration of Mesopotamia w the British Govt. published in 1920 (Cmd. 1061 of 1920) figures showing a large balance of revenue over expenditure each of the four years ending with March 31 1919, and only a paratively small deficit for the following year, and stated that fo whole period of five years “the aggregate civil expenditure approximately £8,000,000 . . . while the receipts amounted to a £10,000,000.” 1920–1 was a bad year, with a rebellion in prog little revenue coming in and expenditure inevitably heavy. 1922 Parliament was asked to vote money to make good the “ deficit” in Mesopotamia on March 31 1921, from which date sponsibility for the finances lay with the ‘Iraq Government. figure was put at £1,087,000, but ultimately only £559,000 required. Even this figure, although supported by appropria accounts and audits, hardly represents the real facts. There expenditure in Persia and in Nejd, expenditure on refugees Armenia and from Russia, and expenditure in connection with tastic War-time enterprises, which had no real connection with public services of ‘Iraq. The financial mission which reported t British and ‘Iraq Govts. in 1925 (Cmd. 2438) quoted the fig as follows:—

	1921–2	1922–3	1923–4	1924– (Revis Est- mates
	(In lakhs of rupees)			
Expenditure	572	479	418	460
Revenue	528	475	508	520
Surplus	..	..	90	60
Deficit	44	4	..	..

The mission pointed out that for the year 1925–6 ‘Iraq was f with a liability of about 80 lakhs for the Ottoman Public Debt an increase in expenditure on the army of 34 lakhs, and that the of these two services was beyond the present financial capacity o country. They maintained that a reduction of one or the other inevitable, and in fact the Ottoman Public Debt contribution not been paid, the actual determination of an amount not havin sulted from the Treaty of Lausanne. The position of the pu finances of ‘Iraq affords no ground for pessimism. “History,” the report of the financial mission, “probably shows no instan a state expected to do so much so soon.”

The public revenue and expenditure are not a safe index of resources of a country even when, as in ‘Iraq, a large propo of the revenue is derived from the Government's share in agricultural output. The machinery of assessment and collectio primitive and defective; and the Government gets far less tha theoretical share, which over a large part of the country is as high 40%.

iculture and Irrigation.—'Iraq is a country within which
and records and traces of very ancient civilisation. Great
s of population were in existence thousands of years ago
ces which are now desert, and these great centres depended
eir existence on a highly-organised system of agriculture
on irrigation. Down to the 13th century 'Iraq was an
ltural country made wealthy by the proceeds of its har-
and its pastures. Those harvests and pastures depended on
gris and the Euphrates rivers which, thanks to an ancient
aborate system of irrigation canals, fed vast areas which
lie derelict. The destruction of that system is definitely
ble to the Mongol invasion of the 13th century. To that
ne catastrophe succeeded a long period of upheaval and
, and then the alien rule of the Ottoman Turk, inimical to
empts at reconstruction, and destructive not only of mate-
sources, but also of the initiative and capacity by which
resources are fostered and developed.

irrigation problem in 'Iraq was made the subject of an
ate series of enquiries and reports in Turkish times by Sir
m Willcocks, and he was responsible for the one important
eering enterprise which has been carried out in the country,
indiyah barrage across the Euphrates, which regulates the
y of water to an elaborate series of canals. The completion
programme which he sketched out would entail a capital
diture far beyond the present resources of 'Iraq; and the
sed difficulty of raising large sums of money for such enter-
after the Great War inevitably postpones the fulfilment
en a more modest programme. The whole question of irri-
n in 'Iraq requires further study and experiment before
tious schemes are undertaken. Irrigation without drainage
be a danger, and may even do more harm than good; for
ted land easily becomes salt and water lavished on one
may leave other areas, which need it equally, dry and unfer-
But the subject is now receiving close study, and it may
ophesied with confidence that the productivity of the coun-
ill be increased by a better use of the water available. The
diate need is for a systematic examination of possibilities
a rigorous avoidance of pretentious schemes inadequately
red.

pulation.—The population which once cultivated vast
of arable land has disappeared, and its restoration must
d less upon immigration from other Arab areas—for the
nal spirit of 'Iraq will not tolerate an alien immigration—
upon a lowering of the death-rate, and especially of the
of infant mortality, which will give the 'Iraqi nation the
ers for which the cultivation of such areas calls. The dif-
ce between desert and fertile land is summed up in this
of the world by the single word "water;" but fertile land
not be productive unless there is a population to cultivate it.
here else in the world will peace, order and good government
rely find reflection in economic development. Improved
itions of health, education and social well-being mean quite
itely in 'Iraq increased productivity.

tton and Oil.—There are well-grounded hopes that new
ces of wealth will be found in cotton and oil. A concession
granted in 1925 for the development of the oil resources of
Mosul and Baghdad Vilayets to the Turkish Petroleum Com-
, which represents a combination of international oil inter-
and is a development of the company which had obtained a
ise of a concession from the Ottoman Govt. in 1914. The
o-Persian Oil Company enjoys similar rights, in virtue of the
nal Persian concession of the D'Arcy Exploration Co., in
transferred territories" which were formerly part of Persia,
here boring for oil has already been successful. The British
on Growing Association have interested themselves actively
e development of cotton cultivation. The production is, as
comparatively small, but the possibilities have been effec-
y proved, and with the improvement of public security the
stment of more capital may be anticipated. There is there-
every reason to expect that a country which was once the
granary of the eastern world will once more become a great
-exporting land.

Communications.—To-day 'Iraq derives much profit from the transit trade with Persia. The route through Russia has been practically closed for some years, and its reopening must be dependent upon the most incalculable of all factors, the political and economic future of Russia. The 'Iraq railways, which have grown out of an emergency War-time line of communications, nearly reach the frontier of Persia, a country undeveloped as regards railways. Baghdad is the *entrepôt* of Persia and Basra its gateway, and the importance of fostering this transit trade is fully appreciated in 'Iraq. The motor service across the desert via Damascus to the Mediterranean at Beirut, due to the enterprise of a New Zealander, has already had far-reaching consequences, and an air service as yet in its infancy has possibilities which can hardly be gauged. 'Iraq looks West to-day, after looking East for thousands of years, and Baghdad is only a week from London.

Port of Basra.—'Iraq has inherited one asset of great value from the War period in addition to its railways—the port of Basra, where vessels of the deepest draught can lie alongside fine wharves fully equipped with railway connections, electric cranes and warehouses. Work is now in progress, and it is hoped nearing completion, which will provide a deep-water channel across the bar of the Shatt-al-Arab and thereby enormously improve the speed and reduce the cost at which vessels can be berthed and cleared. The Shatt-al-Arab is the way not only to the wharves of Margil and the navigable Tigris, but also to Abadan, where the refinery of the Anglo-Persian Oil Company is situated, served directly by a pipe-line from the oil-fields.

Imports and Exports.—Figures of imports into and exports from 'Iraq are as follows (in lakhs of rupees—re-exports excluded):—

	1922–3	1923–4	1924–5
Imports ..	969	879	890
Exports ..	370	422	423

They appear to indicate a heavy "adverse balance of trade," but like most figures relating to 'Iraq, they are misleading unless they are analysed. The expenditure of H.M. Govt. in 'Iraq on the maintenance of the garrison must be accounted an "invisible export," and there has also been a large export of currency—Indian rupees and rupee-paper—since the steady reduction of the garrison reduced the amount of currency needed for internal circulation. There is some reason for believing that the adverse balance has now almost reached vanishing point, and this view is confirmed by the latest movements of the exchange-rate with India. The percentage (in values) of imports from the United Kingdom in 1924–5 was 33, and of those from British India 30. Textile goods formed by far the largest item, sugar and carpets and tea coming next. All these items represent largely articles in transit between Europe and Persia. The principal items of local produce figuring among the exports were dates (183 lakhs in 1924–5), raw wool (84 lakhs) and grain (54 lakhs). (R. V. V.)

IRELAND, JOHN (1838–1918), American Roman Catholic prelate (*see* 14.742), died at St. Paul, Minn., Sept. 25, 1918.

IRELAND (*see* 14.742).—The first part of this article deals with the history of Ireland from 1910 to the creation of the Irish Free State, while the second discusses its agricultural development. Its history subsequent to that date is dealt with under IRELAND, NORTHERN; IRISH FREE STATE.

I. POLITICAL HISTORY

FROM 1910 TO THE OUTBREAK OF WAR

The year 1910 saw the opening of the most important period in the relations between Great Britain and Ireland since the Act of Union. The relative strength of the two great English parties in Parliament as the result of the general election in December made the Liberal Govt. dependent on the assured support of the Irish Nationalists; and this support could only be secured by a genuine effort to pass a Home Rule Bill into law.

Nationalist sentiment was by no means universal. There was a formidable minority for the maintenance of the Union. The line between Nationalists and Unionists coincided roughly with the line between Catholics and Protestants, though a certain number of persons of either religion held the political views generally identified with the other. The Unionist minority existed in every part of Ireland, but was more concentrated in the North. Even in the Unionist North there was a respectable Nationalist minority in Belfast, and in the predominantly Unionist counties of Antrim, Down, Armagh and Derry; in Fermanagh and Tyrone and in the city of Derry Unionists and Nationalists divided the population; in Donegal, Cavan and Monaghan Unionists were in a minority.

All over Ireland, but more particularly in the North, the political cleavage was deepened, and differences exasperated, by the difference in religion. In such circumstances it would not have been reasonable to expect a compromise on the political question; and the Nationalist party as a whole hardly attempted to secure one, or to face the issue of the position of the Unionist population under Home Rule. They seemed to expect that the minority, after violent protests, would accept a position which they would be no longer able to alter. Some of the Nationalists, notably Mr. William O'Brien, saw the necessity of attempting to conciliate the minority; and the All for Ireland League was inaugurated in Cork on March 31 1910, its declared object being to combine "all the elements of the Irish population in a spirit of mutual tolerance and patriotic goodwill."

The Rise of Sinn Fein.—Outside the Nationalist party a small but earnest body of Irishmen, led by Mr. Arthur Griffith, had been for a dozen years[1] declaring that the Nationalist party was upon entirely wrong lines. Their policy was to assert the position that Ireland was a separate and independent kingdom united to Great Britain by only one link, that of the Crown. They went further than the most advanced Nationalists, and claimed for Ireland in the United Kingdom the same position that Franz Deák had claimed for Hungary in the Austro-Hungarian Empire. This party, afterwards known as *Sinn Fein*, had for years insisted that the National movement should include all classes of Irishmen; they recalled the fact that some great leaders of Irish Nationalism in the past, such as Henry Grattan, Wolfe Tone, Robert Emmet and Charles Stewart Parnell, had been Protestants, and tried to enlist Protestant Irishmen in a comprehensive National movement. They repudiated and ridiculed the parliamentary policy of the Nationalist party; they would have the Irish members withdraw from Westminster and devote themselves to building up a national culture and economic life, and to developing Irish industry and commerce, in the hope of ending the economic dependence of Ireland upon Great Britain.

This party, though more intellectually vigorous than the Nationalist party, was small and without any very wide influence in 1911. Its importance lay in its almost fanatical earnestness and in the fact, not then apparent, that a revolution in the affairs of Europe was at hand in which the most drastic constitutional changes would be regarded as almost normal occurrences. But while the Sinn Fein party proposed a peaceful, though extra-constitutional, policy for the immediate future, it did not refuse to contemplate the possibility that Ireland, strengthened by years of perseverance, might in the end find herself strong enough to assert her freedom by force of arms. This brought it much nearer to the revolutionary elements in Ireland than to the parliamentarians.

Republican feeling was represented by the Irish Socialist Republican party founded in Dublin by James Connolly in 1896. It was not till 1911 that this party became active in Irish politics, but during the next few years its influence through Connolly's paper, *The Workers' Republic*, became more and more marked upon the Republican side; and the Irish Transport and General Workers Union founded by him, though not professedly Republican, could always be depended on to cast its weight upon the side of the more "advanced" political parties.

The Ulster Protest.—During the year 1911 Nationalist Ireland was practically undisturbed, but the Northern Unionists were in a ferment of unrest and apprehension. The introduc of the Home Rule Bill was imminent; and while Nation Ireland awaited events in comparative quiet, Unionists aware that, so far as Parliament was concerned, their cause lost. They were convinced that they had an unassailable They held that Ireland as a whole had benefited by the Un and that in particular the industrial development of North Ireland had been made possible by it. They believed that a governing Ireland would prove an irreconcilable enemy of British Empire, and, by its hostility in the case of a future would menace the safety of Great Britain. Ireland was, argued, a strategic position which on naval and military grou alike it would be madness to abandon.

Mr. John Redmond's prophecy that the grant of Home would produce in Ireland a demonstration of "imperial loyalt fell upon deaf ears, and it was not hard to produce statemen a very different tenour, not only from the acknowledged lea of Irish Nationalism of a previous generation but even fr other speeches of Mr. Redmond. Finally, they raised the gious objection to a Parliament which would be composed mai of Roman Catholics, and declared that they would never s it or submit to any laws which it might pass. Their ideals Protestants differed essentially from those ideals which wo command the respect of a Parliament of Irish Catholics, an force them to submit to the decrees of such a body would be tamount to religious persecution.[2] They refused to credit assurances from any quarter designed to allay their appreh sions, and declared that, in spite of any legislation to the trary, they would retain the constitutional position in wh they had stood for more than a century.

The views of the Irish Unionists had often been proclaim but their complete sincerity was called in question. The rest Ireland had not forgotten the United Irishmen, a body arose and had its chief strength in Northern Ireland, and th could not believe that the interval that had elapsed since 17 had completely extinguished in the North the love of indepe ence and the spirit of religious toleration which had once tinguished the Protestants of Ulster. They hoped with so confidence that this spirit would revive or that at the le Home Rule would be accepted under protest. And the Briti Govt. seemed to regard the often vehement defiance of th policy in Irish Unionist circles as but another example of Hi nian hyperbole.

On Sept. 23 1911 a great Unionist demonstration of prot against Home Rule, said by the Belfast newspapers to have be attended by 100,000 persons, was held at Craigavon near fast. It was addressed by Sir Edward (Lord) Carson, the lead of the Irish Unionist party. In the following week the Uls Unionist Council, strengthened by representatives of the Unio ist Clubs and the Orange Lodges, resolved to frame a constit tion and appoint a Provisional Govt. for the province of Ulst to come into operation when Home Rule should become the la of the land. This bold step aroused the Govt. to a sense of th nature of the resistance they might expect, and early in 19 Mr. Winston Churchill decided to explain at a public meetin in Belfast the general principles underlying the governme policy. The Unionist party organisers in Belfast decided that should be prevented, by force if necessary, from speaking in th public hall which had been engaged for his meeting.

No steps were taken by the Govt. to meet the challenge, an their inaction was interpreted in Belfast as weakness. M Churchill spoke (Feb. 8) under military protection, in a marque erected on a football ground, and explained that any measu of Home Rule would be part of a general scheme of devolutio not in any sense inconsistent with the federation of the Empir But nothing he could then say would have had the least effe he was mobbed on his way to the meeting, and had to slip out the town the moment it was over. A month later the Unionis a great counter-demonstration at Balmoral, a suburb of ast, over which the Protestant Primate presided. It was essed by Sir Edward Carson and Mr. Bonar Law, the latter hom declared that Protestant Ulster formed a separate tion" which it would be unjust to force into any political bination with the rest of the population of Ireland. From time on resistance to the Home Rule bill took more and more form of the assertion of the distinct nationality of the Ulster estants, and it was this which finally led the Ulster Unionists issociate their cause from that of the Southern Unionists.

---

[1] Mr. Griffith's paper, *The United Irishman*, first appeared in 1899. The National Council of Sinn Fein was founded in 1905.

[2] The quite recent promulgation of the *Ne Temere* decree in Ir land did much to harden the attitude of Protestant Unionists, bei interpreted as an attempt to subordinate the law of the land to th decrees of the Church.

ome Rule Bill of 1912.—In April 1912 the Home Rule bill introduced in the House of Commons by Mr. Asquith. It osed to establish in Dublin a parliament strictly subordinate Vestminster (a large number of services being reserved for exclusive control of the British Parliament); it did not con- upon Ireland fiscal autonomy, nor did it propose to establish parate Irish Treasury; and Ireland was still to be represented he Imperial Parliament as an integral part of the United gdom. The bill was so far from an attempt to repeal the of Union, that it might have been expected to appease onist opposition: but it was received with uncompromising ility. No one in Ireland was entirely satisfied, although a ionalist convention officially endorsed the bill as satisfactory April 23. It was at best regarded as an instalment, while the eme Nationalists and the Republicans denounced the accep- ce of it as a surrender of Ireland's national rights. An amend- nt to exclude the four counties of Antrim, Armagh, Down Londonderry put forward on June 11 was defeated, both the ne Minister and Mr. Redmond declaring that Ireland must reated as a national unit; but the amendment was a sign of direction in which Ulster Unionists were moving.

he Southern Unionists, who would have been placed in a eless position by the acceptance of the amendment, or by solution of the controversy along similar lines, continued to test against any form of Home Rule; and English Unionists great demonstration held at Blenheim on July 27 pledged mselves through the mouth of Mr. Bonar Law to an almost onditional support of Ulster in resisting the bill. Fortified this assurance the Ulster Unionists took still another step. Sept. 28, amid scenes of great enthusiasm, the "Ulster Cove- t" was signed by large numbers, who pledged themselves lefend their political position by the use of any means which ght be found necessary to defeat the imposition of Home Rule on Irish Unionists. This pledge was at the time understood be a pledge on the part of the Ulster Unionists to resist Home le for the whole of Ireland. Undeterred by the temper of ter, and the opposition of the English Unionist party, the vt. pressed on with their bill, its repeated rejection by the use of Lords serving only to delay its final enactment.

Resistance of Ulster.—Meanwhile the Ulster Unionists de- ed upon a final defiance. They had begun to form companies Volunteers, who were drilled and practised but not yet armed; d on Sept. 25 1913 the Ulster Unionist Council formally ok upon itself the duties of a Provisional Govt. for Ulster, d appointed Sir Edward Carson as head of that Government. n. Sir George Richardson, an officer on the retired list, was pointed to command the Volunteer force, which was formally pected by the head of the Provisional Govt.; committees re formed to manage the various public services, posts, cus- ns, excise; and the administration of justice and even educa- n were entrusted to the care of their special committees.

Ulster Unionists drew a distinction between loyalty to the own and submission to Parliament. In general they acknowl- ge both; as adherents of the Act of Union, they could not but nit the right of Parliament to legislate for every part of the ited Kingdom. But they held that the Imperial Parliament uld not, without the consent of the Protestants of Ulster, alter Act which had conferred upon them the position which by terms they held in the United Kingdom. If Parliament passed Act giving Home Rule to Ireland in any form which they did t approve, then their duty to submit to its decrees ceased to st, and nothing remained but their loyalty to the King. When the royal assent to the Act was given some persons declared that the King had taken a step which put his authority upon a level with that of Parliament. But with the exception of momentary outbursts, the Ulster Unionists protested their entire loyalty to the Crown. This constitutional doctrine would be subjected to a delicate test if the King's army were called upon to support the decrees of Parliament, but it was hoped that the application of this test might be averted.

The proceedings in Ulster were not without effect on the rest of Ireland. The Parliamentary party and its supporters, with an easy optimism, assumed that the difficulty would settle itself, or that Parliament would in the last resort assert its own authority by force. But some elements hostile to the Parliamentary party held that what was happening was the just Nemesis of the policy which, they asserted, had persistently ignored the duty of persuading the Ulster Protestants to accept Home Rule under safeguards for their special interests and guarantees for their special rights. Nationalists of a more advanced type saw in Ulster's passionate repudiation of the authority of Parliament an assertion by a body of Irishmen that Irishmen had the right to the final decision of the terms upon which they would consent to be governed; and they were content to overlook the particular ground of the quarrel between Ulster and Parliament for the sake of the principle logically involved. The official Nationalists were not aware of the complete sincerity of the vast majority of Ulster Unionists, nor did they attach enough weight to the formidable objections to any attempt on the part of Parliament to enforce its authority; while the Nationalists who applauded Ulster overlooked the fact that Ulster's quarrel with Parliament was due not so much to the proposal to govern them in a particular way as to the proposal to divest itself of part of the functions of governing them.

The National Volunteers.—The example of Ulster was contagious. On Nov. 25 1913, at a meeting in the Rotunda in Dublin called by a Provisional Committee representing Sinn Fein, the Irish Republican Brotherhood and the Gaelic associations, it was decided to inaugurate the National Volunteers "to secure and maintain the rights and liberties common to all the people of Ireland, without distinction of class, creed or politics." This formula was a direct challenge to the Ulster Volunteers who held that, Ireland having no separate political existence, there were no rights and liberties which Ireland was specially called upon either to secure or maintain. The formation of the National Volunteers was not at all palatable to the Parliamentary party, who were still confident that Parliament would give adequate protection to any rights and liberties that might be endangered.

After the great strike which paralysed Dublin during the autumn of 1913, the Citizen Army[1] began to be enrolled, with headquarters in Liberty Hall, the property of the Irish Transport and General Workers Union. Though comparatively few in numbers, the Citizen Army, composed of men who with their families had suffered during the strike and were prepared to take great risks, played a very important part in later political developments.

The Govt. in Ireland, now awake to the possibilities of disturbance, proceeded to seize arms consigned either to Dublin or Belfast; and in December a proclamation was issued, in spite of the repeal of the Arms Act by Parliament in 1910, prohibiting the importation of arms into Ireland. The validity of the proclamation was immediately challenged in Belfast, and it was not until June 15 in the following year that the Court of King's Bench in Dublin ruled on appeal in favour of its validity. Meanwhile small consignments of arms were making their way into the country, and preparations were being made upon both sides for the wholesale purchase of arms on the Continent.

Proposals for Compromise.—A conference between representatives of the Govt., the two Irish leaders and the leader of the English Unionist party led to no result, Sir Edward Carson being now confident of his ability to beat the Govt., and Mr. Redmond being unwilling to consider the exclusion of any part of Ireland from the scope of the bill. The Prime Minister, however, on March 9 1914, proposed a compromise of his own, that six counties of Ulster should be excluded for five years, on the understanding that unless Parliament, at the end of that time, should otherwise determine they should be included without further delay. Both Irish leaders publicly refused to consider the expedient, Sir Edward Carson on the double ground that the security offered to his followers was insufficient, and that he could not agree to abandon the Unionists of the rest of Ireland. After his speech in Parliament he and the other Irish Unionist members withdrew from the House, and crossed to Belfast, where he issued his final challenge to the Govt.: "Give us a clean cut or come and fight us." The policy of the "clean cut" thus became the official policy of the Ulster Unionists as offering the best chance of success, but its adoption, nevertheless, was more or less a disappointment to Irish Unionists outside of Ulster.

---

[1] The character and aims of this body are set out in *The Citizen Army* by P. O'Cathasaigh (Dublin, 1919).

The Curragh Incident.—It was clear now that Ulster Unionists were prepared, if necessary, to resort to arms, and the Govt. took measures to protect the military stores in Ulster from being seized. On March 20 the attitude of the army was brought into sudden prominence by the "Curragh incident." Gen. Hubert Gough, with a large number of the officers stationed at the Curragh in Co. Kildare, on being asked whether if ordered to Ulster they were prepared to go, replied by tendering their resignations, some of them (at least) on the ground that such a question should not have been put to an officer. Their refusal, though their resignations were subsequently withdrawn as the result of mutual explanations, led the Ulster Volunteers to believe that the army was with them, that it had yielded to the insistent appeals to refuse to be made the instrument of "coercing loyalists."

But the Ulstermen did not relax their vigilance, or countermand their orders for arms, on that account; and on the night of April 24 there was landed, under the superintendence of the Volunteers, at both sides of the mouth of Belfast Lough a consignment of nearly 50,000 rifles and 3,000,000 rounds of ammunition. The fact that the naval squadron, stationed at Lamlash for the purpose of supporting the army in the event of a conflict in Ulster, had not intercepted the vessel conveying the rifles was interpreted in Belfast as an indication that the sympathies of the navy, as of the army, were with Ulster.

On June 9 1914 Mr. Redmond identified himself formally with the Volunteers already in existence in Dublin and the South. The original committee, with some reluctance, for Mr. Redmond's policy was increasingly divergent from their own, allowed him to nominate additional members of the committee. The National Volunteers were still unarmed, but their arms were already on the way.

Meanwhile the Home Rule bill was nearing the end of its course. It passed its third reading on May 25 1914. The Govt. were considering an amending bill, as certain to be as strenuously opposed by the Upper House as the bill which it was intended to amend; and as a last resort a conference was called by the King at Buckingham Palace to see whether some compromise could be arranged. After three days the conference broke up on July 24, each party adhering stoutly to its original position. Two days later the National Volunteers landed a consignment of arms at Howth in broad daylight. The Deputy Commissioner of the Dublin Metropolitan Police, hearing of the landing, called upon the military for assistance, and intercepted the Volunteers who had superintended the landing as they marched back with their arms. After some parley, however, the details of which are uncertain, the Volunteers were allowed to retain their arms, on condition of disbanding before they reached Dublin, and the soldiers marched back to their barracks. On the way they were assaulted by a jeering mob, on which they turned and fired, killing three persons and wounding a considerable number. This occurrence caused a profound sensation. The Govt. decided to dissociate itself from the Dublin incident, and the Assistant Commissioner, whose zeal had brought it about, was eventually dismissed on the ground that he had exceeded his authority.

The War Period

When a few days later war was declared against Germa Mr. John Redmond, in a moving speech in the House of Co mons, declared that all quarrels between Great Britain and land were at an end, that Ireland ranged herself on the side England and her Allies, that English troops might with safe be withdrawn from Ireland, whose shores during the War wou be "defended by her armed sons." His attitude aroused great thusiasm in England, but in Ireland the response was less war On his own side the more advanced of his followers thought th he had failed in his duty to Ireland by this unconditional d laration, and the Northern Unionists, though they received words with respect, were inclined to wait before committing the selves. It was not long before party passion was again arouse The Cabinet had to decide upon their policy with regard to Ho Rule in the new circumstances. They chose to proceed as usu to the royal assent (Sept. 1914), but of postponing the oper tion of the Act for a year (or to a date after the terminati of the War to be fixed by Order in Council), with a promise introduce, in the interests of Ulster, an Amending bill when t War should be over.

Their action was denounced by the Unionist party both England and in Ireland as a breach of the war-time truce party politics; in Nationalist Ireland the promise of an amendi bill robbed the provisional enactment of Home Rule of much its value. The members of the committee in control of th National Volunteers divided into two sections, those in favo of Mr. Redmond's policy and those who adhere to the origin principles of the Volunteers. The latter seceded and formed distinct body, the Irish Volunteers, opposed to enlistment in th British Army and to any compromise upon the principle of th unity and independence of Ireland. But this party was in minority, and the appeals of Mr. Redmond and the Prim Minister (who came to Dublin to address a recruiting meetin met with considerable success. Southern Unionists united co dially with Irish Nationalists in the efforts to enlist Irish soldier many of the National Volunteers joined the army, and it seeme as if Mr. Redmond's enthusiastic support of the Allies was t prevail.

In Ulster recruiting was more successful. The Ulster Volun teers did not (any more than the National Volunteers) flock t the colours. They retained their arms, and they kept up thei organisation. They found themselves faced by a double duty that of protecting the Empire and that of securing their ow political position. The Ulster Division, formed out of thos Ulster Volunteers who enlisted and other Ulster recruits wh did not join the Irish regiments of the line, did not readily admi Nationalists or Catholics to its ranks; the Ulster Catholics wh enlisted were as a rule sent South to join the Division forme out of the Nationalist recruits of the other three provinces; an Sir Edward Carson refused to address a recruiting meeting company with Mr. Redmond.

During the year 1915 the Ulster mills and shipyards were working at high pressure on Govt. orders and the farmers were extremely prosperous. A period began in which constant employment at good wages was open to the workers and large profits could be made by the manufacturing and commercial community. As the War progressed this tended to check recruiting for the army. In Southern Ireland recruiting was at first fairly satisfactory, though the percentage of able-bodied men who enlisted was not so high as in Northern Ireland, and agriculture began as in Northern Ireland to enter on a period of great prosperity.

The political situation was peculiar. Nationalists and Unionists in the South had sunk their old political difficulties in the task of inducing men to enlist, but their efforts were checked and in the end nullified from two opposite quarters. The War Office in England made no concessions to the national feelings of the Irish recruits, who desired to be allowed to carry the national colours on service and were refused permission to do so. Difficulties were thrown in the way of the formation of an Irish Div. (though one was eventually formed), while the Ulster Div. was

to be favoured by the authorities. The Nationalist Irishmen
volunteered for the army resented this the more because it
ned to imply that the national claim was to be ignored in spite
he service which Mr. Redmond's trustful policy had done to
cause of England.

he Easter Rebellion.—The Sinn Fein party and the Irish
ublican Brotherhood had been long opposed to Mr. Redmond
his policy. The more belligerent spirits revived the old max-
that "England's difficulty was Ireland's opportunity," and,
ting to the increasing difficulties of the Allies, asked whether
time had not arrived for a vigorous attempt to secure what
right not soon again be possible to claim with such apparent
e of success. These arguments were enforced with growing
lness in a number of papers, *Sinn Fein*, *The Workers' Re-
lic*, *Irish Freedom*, *Eire* and *The Irish Volunteer*. These were
pressed three months after war had broken out, and the im-
tation of two American papers which proclaimed the same
cy, *The Gaelic American* and the *Irish World* was prohibited.
other papers sprang up to take their place, such as *Scissors
Paste* and *Nationality*. Pamphlets, some of them written
h considerable ability, in favour of the same policy, were
ely circulated. Organisers formed branches of the Irish Volun-
s, spoke against recruiting, and spread the doctrines of Sinn
n and the Republican Brotherhood. Arms, ammunition and
losives were imported. The Govt. arrested and deported
ie of the most active of these organisers and attempted, not
ays with success, to secure the punishment by the courts of
arrested on the charge of breaking the regulations made by
Defence of the Realm Act, 1914.

his party had agents and correspondents in the United
tes, and early in the war Sir Roger Casement had gone to
many, with the knowledge of the Irish Republican leaders,
induce the German Govt. to lend armed assistance in the
nt of an Irish rising. Most of these facts were known to the
horities, but the Chief Secretary, mistaking the significant for
accidental, took no drastic or immediate action. The Vol-
eers drilled, paraded and practised war-like manoeuvres
ler the eyes of the police.

s early as May 1915 the project of an immediate rising had
n discussed by the Committee of the Irish Volunteers, but it
not till the early part of 1916 that there was general agree-
it that the right moment had arrived. America was still
tral, and the friends of the Volunteers there could assist them
h comparative freedom. Germany was, it is true, unwilling
end help in the shape of an invading force, as Sir Roger Case-
it had requested, but was ready to send a vessel with warlike
es. It was hoped that Sir Roger Casement would arrive with
se late in the week preceding Easter, and Easter Monday was
d as the date for the rising. The Volunteers throughout Ire-
d were ordered to be ready for a "very interesting series of
noeuvres at Easter." The German vessel, the "Aud,"
ived with her stores, but sighting no signals from the land and
ng accosted by and requested to follow a British gunboat was
ttled by her crew. Sir Roger Casement landed from a sub-
rine on the Kerry coast; but by mistaking their directions, the
upants of one of the two motor-cars told off to capture the
marine cable station at Valentia drove into the sea and were
wned; no one met Sir Roger Casement, who was captured by
police and hurried across Ireland to prison in London.

he news reached Volunteer headquarters on the Saturday
ore Easter. The chairman of the committee, Prof. John Mac-
ll, at once countermanded the order for the "manoeuvres"
Dublin, and sent messengers to warn the country battalions.
a section had determined to persevere with their plans at all
s, and, without the knowledge of the chairman, attempted
Easter Monday to carry out their original design. On Easter
nday they proclaimed the Irish Republic. They seized the
t Office, the Four Courts, Stephen's Green, Boland's Mill and
ob's Biscuit factory, all strategical positions; they seized
ses on both sides of the road in Lower Mount Street, com-
nding the route by which any troops summoned from England
st have entered Dublin. But they failed to secure two very important points, the Castle and Trinity College; and though they held the telegraph headquarters in the Post Office, they did not capture the telephone exchange.

The authorities, civil and military, were for the moment paralysed. So complete had been their confidence that the officers of the Dublin garrison had been granted leave of absence to attend the Fairyhouse races. But on the evening of Easter Tuesday April 25 1916, the first companies of the 178th Infantry Brigade landed at Kingstown and fought their way past the fortified houses that lined their route. The light artillery shelled the Post Office, and on the evening of April 29 the Volunteer stronghold surrendered unconditionally to Sir John Maxwell. Outside Dublin City there was practically no fighting. The rising was foredoomed to failure; and there is some evidence to show that some of those who actually led it knew that this was so, and hoped for no more than that by the sacrifice of their lives they might, as other Irishmen had done before them, furnish to their countrymen an example which would not be forgotten in other days.

Of the leaders 15 were tried by court-martial and shot, 160 prisoners were sent to penal servitude for various terms and 1,841 were deported to England and interned there. From the date of these executions Sinn Fein and the Republican party began to acquire an influence and a following which in a short time made them the dominant factors in Irish political life.

Mr. Lloyd George's Conferences and the Convention.—Early in June 1916, Mr. Lloyd George was entrusted with the task of making another attempt to settle the Irish difficulty on the basis of the exclusion of six Ulster counties. Mr. Redmond and his party would have agreed to a temporary exclusion of them, provided that the Home Rule Act were put into immediate operation in the rest of Ireland; Sir Edward Carson and his followers claimed that the exclusion should be definite and permanent. No agreement was reached,[1] and at the end of July Mr. Duke became Chief Secretary for Ireland and Sir James Campbell, Sir Edward Carson's chief lieutenant, was appointed as Irish Attorney-General. It seemed as if a stern policy of repression were in contemplation, but the new Chief Secretary was more inclined to conciliation. In Dec. Gen. Maxwell, who had been in command since Easter, was recalled, and just before Christmas 600 of the prisoners interned in England were released.

The next year (1917) saw a revival of the irrepressible national feeling of which Sinn Fein became more and more the authoritative exponent. In Feb. the publication of the Sinn Fein paper *Nationality* was resumed, and two by-elections in Ireland in Feb. and May resulted in the return of Sinn Fein candidates. A statement by the Prime Minister (now Mr. Lloyd George) in Parliament on March 7, declining to consider any proposal for Home Rule which would place the Ulster Unionists under an Irish Parliament against their will may be taken as the final step in the process by which the Irish Nationalist party finally lost its influence both in Parliament and in Ireland. Later in the month Count George Plunkett, the newly returned member for North Roscommon, called a convention in the Mansion House, Dublin, to inaugurate an Executive for Sinn Fein; while in the middle of the following month the Prime Minister proposed to summon a convention representative of all shades of opinion in Ireland, including even Sinn Fein, to draw up proposals for an Irish settlement.

Mr. Lloyd George's proposal was accepted by all parties except Sinn Fein, who were offered a representation unequal to their importance in the country and whose principle—Irish independence—would not have been even considered by the other parties. The Ulster Unionists, while sending delegates, insisted that they should have no power to agree to any proposal which had not been communicated to and endorsed by the Ulster Unionist Council. As the Prime Minister had intimated that the Govt. would not be bound by the findings of the convention unless there was "substantial agreement" the Ulster Unionists were thus in a position practically to veto any finding which was not their own. On June 15, to provide an atmosphere of general goodwill for the convention, the remaining Irish prisoners were released and returned to Ireland. In July the vacancy in east Clare, caused by the death in action of Maj. Willie Redmond, resulted in the return of Mr. de Valera by an overwhelming majority. Mr. de Valera had been in command of a company during the Easter rising in Dublin and had just been released from prison.

---

[1] Mr. Redmond asserted that Mr. Lloyd George had led him to believe that the exclusion contemplated was only temporary; even on this understanding he had great difficulty in persuading his followers (especially in Ulster) to agree to it. Sir Edward Carson claimed that he had understood Mr. Lloyd George to offer permanent exclusion, the only basis upon which he would negotiate; he was strengthened in his position by the attitude of prominent members of the House of Lords who, still opposed to Home Rule on principle, were likely to upset any arrangement with which the Ulster Unionists were not satisfied.

But in the autumn the atmosphere of goodwill was disturbed. The Volunteers began again to drill and the Govt. began again to arrest. And on Aug. 15 the military raided the barracks of the National Volunteers throughout the country and carried off their arms. This action, coupled with the complete immunity from disturbance enjoyed by the Ulster Volunteers, was significant. On Oct. 25 Sinn Fein summoned a convention of its own, at which Mr. de Valera was elected President, in place of Mr. Arthur Griffith, who had been till then the sole acknowledged, as he was still the ablest, leader in the party. The election indicated the final amalgamation of the Sinn Fein and the Republican parties and the formal acknowledgment by Sinn Fein of the service done by the leaders of the Easter rising. But the inexperience of the new leader was, fortunately for Sinn Fein, still allied to the ripe wisdom and real ability of its older chief. Mr. Lloyd George's convention reported on April 8 1918, but there was no "substantial agreement." It was decided therefore that the report furnished no basis for legislation and the situation in Ireland remained where it was.

But the Cabinet had by this time decided upon the application of conscription to Ireland. It was a most serious decision. The Parliamentary party joined with every other section of Irish Nationalist opinion in resistance to it, and the decision in consequence could not be enforced. Mr. Redmond did not live to see this final collapse of all his efforts for peace between Great Britain and Ireland, for he had died on March 6, the very day on which an Irish district (the Co. Tipperary) had been named a "special military area."

Military Rule in Ireland.—On May 1 Mr. Edward Shortt succeeded Mr. Duke, the viceroy (Lord Wimborne) was replaced by Lord French and the viceregal court was transformed into the headquarters of a military administration; at the same time Sir James Campbell was raised to the office of Lord Chancellor of Ireland. The new administration began by arresting prominent Sinn Fein and Republican leaders, and Sinn Fein, the Republican Brotherhood and their allied societies were "proclaimed." Conscription was not put into force; voluntary recruits, who were promised grants of land after the War, were called for in a viceregal proclamation and recruiting continued with some degree of success until the end of the War. At the General election of 1918, out of 106 members for Irish constituencies, Sinn Fein returned 73, who immediately refused to take their seats in Parliament, formed themselves into the Assembly of Ireland (Dáil Eireann) and elected Mr. de Valera as President of the Irish Republic, with a number of ministers of departments, answerable to the Dáil. From this date until the conclusion of the Anglo-Irish Treaty the history of Ireland is the record of one long struggle between two forces, the British Govt. in Ireland relying upon the right of possession, the existing law and the troops, and Dáil Eireann, claiming to be representative of Ireland's right to freedom and adopting the usual methods of insurgent peoples.

FROM THE ARMISTICE TO THE TREATY

During the year 1919, a large portion of the country was portioned off into "special military areas." The plan usually adopted was to proclaim any district in which an officer of the Crown had been shot. But efforts were not wanting to bring about a peaceful solution. The Irish Centre party, later changing its title to that of the Irish Dominion League, in which the most promine members were Sir Horace Plunkett, Gen. Sir H. Gough, Ca Stephen Gwynn and Capt. Henry Harrison, endeavoured to pre upon both English and Irish opinion through their organ, *T Irish Statesman*, the necessity for a solution of the Irish questio along Dominion lines.

The Republican party on their side endeavoured in vain have the case of Ireland brought before the Peace Conference b President Wilson. This hope had finally to be abandoned whe on May 31 the American Peace Delegation in Paris refused receive the Irish Republican envoys. In March the Govt. trie to placate Irish opinion by releasing their prisoners, and Mr. Valera, who had succeeded in Feb. in escaping from Lincoln jai was able to proceed to America to put the case of Ireland befo American statesmen and the American public and to raise republican loan in the United States. Shortly after he left t policy of boycotting the families and dependents of the poli began to be put into force with the object of bringing about whol sale resignations from the police force. Later in the year (o Sept. 12) the Govt. retaliated by proclaiming Dáil Eireann a "a dangerous association." This did little to ease the situatio and from the beginning of winter raids for arms, the burni of barracks and courthouses and the shooting of police becam matters of weekly occurrence. The first "reprisal" took plac on Sept. 17, when the soldiers at Fermoy wrecked the shops o tradesmen who, as members of a coroner's jury, had brought i an open verdict in the inquest on a soldier who had been shot o leaving church by a number of armed men who deprived th church party of their arms.

The Last Home Rule Bill.—Towards the end of the year th Govt. introduced the last Home Rule bill, providing for tw separate Parliaments in Ireland, one for six counties in Ulste the other for the rest of Ireland; each Parliament was to hav control of the government of its own area, while customs an excise, the army and navy, foreign relations and the Post Offic were reserved for the Imperial Parliament, Ireland contributin as its share of the cost of their upkeep an annual sum of £18,000, 000. The Act also contained provision for the amalgamatio of the two Parliaments by mutual consent. It fell far short o what the Republicans claimed; it was regarded with dismay b those Southern Unionists who still wished to continue the figh against Home Rule and with still greater dismay by the Unionist of the three Ulster counties which were not to come under th Northern Parliament. The Unionist party in the six countie agreed to accept it.

Repression in Ireland, 1920.—By April the Govt. had decide to make a final effort to suppress by force the Republican part and its sympathisers. On the 4th of the month, Sir Hama Greenwood was appointed Chief Secretary for Ireland, and th activities of the "Black and Tans" and the Auxiliaries, unde the control of Maj. Gen. Sir Henry Tudor, began. In July Gen Macready was appointed commander-in-chief in Ireland with a army of 60,000 men under his control. But on May 4 the corporation of Dublin formally acknowledged the authority of Dái Eireann, and its example was followed pretty generally throughout Southern Ireland. On May 19 the Sinn Fein courts began t function, and in a short time had replaced the King's courts ove a large area of Ireland. The conflagration spread to the North on Aug. 8 the shooting of a district inspector of police in Lisburn (Co. Antrim) was the signal for the burning by a Protestant mob of the shops and houses of prominent Catholics, and on Sept. 25 the shooting of a detective in Belfast led to similar excesses there. Four days before this the town of Balbriggan had been partially sacked as a reprisal for the shooting of two policemen in a public-house.

During the course of the year reprisals of this kind took place in nearly 20 towns, culminating in the serious conflagration in Cork on Dec. 18. These reprisals, except in the cases of Belfast and Lisburn, were the work of the Crown forces. But in the case of the "Black and Tans" and the Auxiliaries, recruited among ex-service men, it had been understood from the first that they were to be allowed a considerable freedom. Their excesses me notorious; roaming the country, armed to the teeth, they orised the countryside.

n the other side the Irish Republican Army, moving about ight or in lonely places, sheltered and protected by the favour, in some cases by the fear, of the inhabitants, laying ambushes, oting spies or persons believed to have furnished information he Crown forces, picking off small parties of their opponents, le life a nightmare to any members of the police and military found themselves outside their barracks. Both sides fired hrew bombs at the members of the other at sight, often in vded streets, to the danger of the civilian population. One of most horrible of the incidents of the struggle took place on the ning of Nov. 21, when 21 officers were shot at an early hour in ir lodgings, without opportunity of defence or escape. Such the condition of Ireland when on Dec. 23 the bill for the ter Government of Ireland became an Act of Parliament.

olicy of Reconciliation.—But early in 1921 it became ap- ent that the true facts of the state of Ireland could no longer concealed. The tide of opinion in Europe and America was inning to set steadily against Great Britain. The policy of eprisals" was checked and exchanged for one of "official risals." Gen. Macready issued an order that in future houses the vicinity of an ambush laid for the troops, whose inhabit- s might be presumed to have known of it and had not given ormation, were to be burned. But public opinion in England an to be roused.

n April 21 Lord Fitzalan was appointed Viceroy of Ireland, first Catholic to hold the position, and so great was the uni- sal desire for peace that early in the following month Sir James ig, who had succeeded Lord Carson as the leader of the Ulster ionists, held a conference with Mr. de Valera with a view to a tlement. During the same month, the elections for the two v Parliaments were held. In Southern Ireland out of 128 ts, 124 fell to the Republican party; in Northern Ireland out 52 seats the Unionists secured 40, the others being divided be- en the Nationalists and the Republicans. In Southern Ire- d the Republicans refused to acknowledge the new Parliament ich, in consequence, could not meet. On May 25 the Customs use in Dublin with all its records was burned to the ground by arty of the Republican Army, and on the following day the vernment resolved to send more troops to reinforce its army ccupation.

Meanwhile preparations went on for the formal inauguration Home Rule in the six counties of Northern Ireland, which by irony of fate were the first to accept a measure which a few rs before they had repudiated with anger. On June 7 the rthern Parliament was opened by the Viceroy, and on June 22 King and Queen visited Belfast, when His Majesty address- ; the new Parliament urged upon them and the rest of Ireland necessity for harmony and goodwill. But the Govt. had re- ved to yield, and on July 8 at a conference in the Dublin nsion House between Gen. Macready and the Republican ders and representatives of the Southern Unionists, invited by r. de Valera, a truce was signed by which the trial of strength ich had lasted for so long was finally to be at an end.

The Irish Treaty.—The relief in Southern Ireland was intense. was hoped that the details of an agreement would be settled a conference between the Prime Minister and the Republican voys: but after seeing them on July 14, the Prime Minister had neeting with Sir James Craig, who made it clear that the six nties would not under any circumstances agree to a union th the rest of Ireland, though they would endeavour so far as ssible to co-operate on a basis of mutual independence. Mr. oyd George thereupon offered the Republican leaders for the counties the status of a Dominion with certain reservations, inly with regard to the military, naval, fiscal and financial erests of Great Britain. On returning to Ireland and consult- Dáil Eireann and the Executive of Sinn Fein, Mr. de Valera imated to the Prime Minister, both on his own account and the spokesman of the Republican party, that these proposals ld not be entertained, and to this decision, in spite of vice and threats, the party adhered firmly.

Long negotiations followed, in which it seemed at every step that a break was inevitable; until finally on Sept. 30 the Republican leader accepted, with no other comment than the words "our respective positions have been stated and understood," an invitation to send envoys to London "with a view to ascertaining how the association of Ireland with the community of nations known as the British Empire may best be reconciled with Irish national aspirations." The Irish envoys were Mr. Arthur Griffith, the founder of Sinn Fein, Mr. Michael Collins, who had chiefly organised the military policy of the Republicans and had been Finance Minister of Dáil Eireann, Mr. R. C. Barton and Mr. G. Gavan Duffy, with Mr. Erskine Childers as their secretary; they met the Prime Minister, Mr. A. Chamberlain, Mr. Winston Churchill, Lord Birkenhead, Sir Gordon Hewart, Sir L. Worthington Evans and Sir Hamar Greenwood.

After protracted discussions there was signed on Dec. 6 a treaty by which Ireland was accorded the constitutional status of a Dominion; the right of Northern Ireland to intimate its desire to remain under the Act of 1920, provided it did so within one month of the ratification of the treaty by Parliament, being secured and provision made in that event for a commission finally to decide upon its boundaries. The new Dominion was to have complete fiscal autonomy, the right, within certain limits, to maintain an army and was to have its financial obligations to Great Britain regulated by mutual agreement or arbitration. The treaty was ratified by the British Parliament on Dec. 16. It was not till Jan. 7 that a debate, which had begun on Dec. 14 in Dáil Eireann, concluded by a division in favour of the treaty. Mr. de Valera, who disapproved of it, ceased to be President of Dáil Eireann and his place was taken by Mr. Arthur Griffith, Mr. Michael Collins becoming head of the new Provisional Govt. appointed to carry the provisions of the treaty into effect; and on Jan. 16 1922, Mr. Collins formally took over from the Viceroy Dublin Castle and all the offices of Govt. in the name of the Irish Free State.

Bibliography.—It is impossible to name all the books and pamphlets which have appeared on the Irish history of the years 1911–22. Current Irish events may best be studied in the files of the leading Irish newspapers, *The Irish Times* (Unionist), *The Freeman's Journal* (Nationalist) and the *Belfast Newsletter* (Ulster Unionist). The last named may be consulted for the manifestoes of the Ulster Unionist party and for the expression of the aims and feelings of the party. The Sinn Fein standpoint can best be studied in its newspapers, mentioned in the preceding article, files of which are preserved in the National Library, Dublin, and in its various pamphlets (to be found in the same library). The writings and pamphlets of Patrick Pearse, the intellectual author of the rising in 1916 and one of its principal leaders, furnish the best key to an understanding of the motives which gave rise to it. There are many official publications which should also be consulted, such as the *Report of the Royal Commission on the Rebellion in Ireland*, Cd. 8279 (1916); *Documents relative to the Sinn Fein Movement* (1916); *Report of the Proceedings of the Irish Convention* Cd. 9019 (1918), etc. On the conditions in Ireland during 1920 and 1921 the anti-Republican account is given in *The Administration of Ireland in 1920* (1921) and *Ireland in 1921* (1922) by I. O. (C. J. C. Street) published by Philip Allan & Co.; while the Republican account may be studied in the files of the *Irish Bulletin*. These should be supplemented by the *Report of the Labour Commission to Ireland* (London, 1921) and *Evidence on Conditions in Ireland* (American Commission, Washington, 1921).

(R. M. H.)

II. AGRICULTURAL CO-OPERATION

The main interest and importance of the co-operative movement in Ireland since the beginning of the World War consists in the struggle of its promoters to preserve and develop it as the chief agent for implementing a certain philosophy of rural life and evolving an agricultural policy consonant therewith. The movement had been initiated a quarter of a century before the War by men who were not themselves farmers, and its inspiration has ever since come from practical idealists. These men realised that in a country dependent upon a sound agricultural economy for the well-being of every section of the population, a technically educated and efficiently organised rural community was of the first importance.

In countries highly industrialised, agriculture could be neglected without disaster; in a country predominantly agricultural the efficient production and economical distribution of food was what mattered most. Yet those who saw that these ends could best be obtained by the application of the co-operative principle and system to the occupation of farming were chiefly concerned for the building of a rural civilisation which would provide intellectual interests and social amenities calculated to counteract "the lure of the city." For the solution of the modern rural problem as they saw it, they invented the formula: "Better Farming, Better Business, Better Living." To use a New World phrase, the "pivotal" thing was Better Business and Better Business was co-operation.

Agricultural Organisation Society.—The post-War civil disturbances in Ireland might well have wrecked the movement. War prices and a demand which ignored quality had considerably demoralised the dairy societies. The movement was in no condition to meet the sudden decline in prices which set in in 1920–1. It became clear that its future success—perhaps even its survival—would depend upon the ability of the Irish Agricultural Organisation Society to continue its service as guide, philosopher and friend of the societies. This central body had always derived from the farmers it served and from philanthropic individuals a large part of its funds. In the circumstances of the country, these subscriptions were bound to fall off. While the Development Commission, which was authorised by its Act to treat "the organisation of co-operation" as one of the ways of "aiding and developing agriculture," functioned in Ireland it subsidised the I.A.O.S. for this purpose. Under the Anglo-Irish Treaty the Commission transferred its functions and a proper proportion of its funds to the two Irish Governments. The I.A.O.S. had to be partitioned, an Ulster A.O.S. being formed to operate in the six northeastern counties.

The Govt. of the Irish Free State has from year to year continued the grants to the I.A.O.S. and for its first year the Govt. of Northern Ireland continued it to that part of the organisation movement which came within its territory. This, however, was not renewed, and in Northern Ireland the movement in consequence had greatly to restrict its work. But that the farmers there have come to realise its value is evident from the fact that of its total funds in 1925 more than two-thirds came from societies' contributions, so that it was able to end the year without a deficit.

The new Free State Govt. wished to reconstitute the agricultural policy of the country. This was to be expected in a land which, itself purely agricultural, had just obtained independence from a union of countries mainly industrial. The department was merged in a new Ministry of Lands and Agriculture, and a commission on Agriculture was set up which made many far-reaching recommendations, especially emphasing the importance of agricultural education and commending the development of co-operation as well as an increased subvention to the I.A.O.S. At present the Ministry and the organisation society are engaged in negotiations pointing towards increased Government aid.

Statistical Position.—In the country signs are not lacking of a renewal of co-operative enterprise. The largest trade federation of the movement, the Agricultural Wholesale Society, which made great progress in the more prosperous years, participated to the full in the country's economic depression; but "Irish Co-operative Meat, Ltd.," established in 1920, with headquarters in Waterford, is now preparing to work on a large scale. It was unable to function during the years of civil disorder, but has already a membership of 5,793, with a share capital of some £175,000, of which £65,000 has been paid up, the source of the capital being farmers or farmers' co-operative societies. The shipment of pigs was begun in 1925, and the society proposes shortly to deal weekly with 100 cattle, 1,000 pigs, and to be able to cold store 200 tons of butter (or equivalent produce) at one time. The Irish Co-operative Agency Society, which markets the butter of the creameries, had in 1924 a trade turnover of £555,649, representing a quantity of butter only slightly exceeded by the years 1920 and 1922, the highest recorded.

A further development took place in 1925. The credit societies were doing a dwindling business, largely because the I.A.O.S. could not pay for propaganda and inspection, but the Commission on Agriculture had recommended that this aspect of co-operative business be specially endowed; two winters disastrous for farming (1923–4 and 1924–5) had resulted in severe losses of live stock through fluke, etc., and the Dáil of the Free State, at the instance of the Minister for Agriculture, passed a vote for loans not to excee £100,000, for restocking of lands, to be advanced to credit societie approved by the I. A. O. S., to whom the administration of the schem was entrusted. Thus were re-established satisfactory relations between the state aid and the self help parts of a movement which ma encourage other countries to adopt the device of an "organisatio society," working in close co-ordination with the governmental Departments of Agriculture. There was, too, during the winter o 1925–6 a revival of energy among the dairying societies.

The organisation of about 150,000 farmers (in a country containin about 4,250,000 people) into a movement whose aggregate busines for the decade 1914–23 (inclusive) was well over £80,000,000—t which creameries contributed about one-half—is not an unimportant factor in Irish economics.

Education.—The need of all co-operative movements is always education, and the higher the development the greater i that need. The hampered condition of the Central Organisatio Society is probably the true cause of the halt of the movement a a whole. Up to the present, the I.A.O.S. has had to render man services, notably technical advice to creameries and other societies, which the Govt., through the Ministry, are now renderin under the Dairy Produce Act and the Agricultural Produc (Eggs) Act. To ensure the future of co-operation, technical instruction in itself is not the chief desideratum. When it ca leave that to the Ministry, the Organisation Society will concentrate on educating the farmers not only in credit and the technique of co-operation, but in the co-operative spirit—withou which loyalty and solidarity, essentials to success, must alway be lacking. The standard of efficiency required of the moder farmer is only to be attained by an educated man.

The Govt. of Northern Ireland, like that of the Irish Fre State, through its Dept. of Agriculture, enforces egg-grading but the Ulster Organisation Society, with an income of £913 3s. 6d., cannot do the work necessary to educate the farmer u to a standard which the Govt. can only punish him for failing t reach. The work, therefore, cannot be expected to show immediate spectacular results, but that, it must be understood, i as much due to the width of the aim as to the narrowness of th resources. And these two have another connection. To-day th central society's funds are largely drawn from the fees the farmers will willingly pay it for technical instruction, which is not a co-operative but a manufacturing technique. When that function is transferred to Govt. and the Organisation Society is devoted to its educational but less remunerative purposes, the farmers' financial support will for some time be considerably lessened.

Nevertheless, the founders of the movement were convinced that nothing less than a continual extension of the study of th rural problem—the regarding of agriculture as an *industry*, as a *business* and as a *life*—could bring the country population even to the standard demanded under modern economic conditions. The next step, therefore, in this concerted advance was to gather and distribute knowledge of every side of agricultural co-operative evolution the world over, and to provide a centre at which students and organisers could study and compare the progress of local developments. To provide this, the Co-operative Reference Library had been founded in Dublin in 1913. One of the founders of the Irish movement has endowed a trust (which the trustees christened the Horace Plunkett Foundation) for the purpose of extending the Irish philosophy of rural life throughout the British Commonwealth.

Under its auspices there was convened at Wembley in July 1924, a conference on agricultural co-operation in the British Empire. The delegates, who were thoroughly representative of agriculture in this vast area, approved the Irish policy, and called upon the Foundation to establish an office in London to act as a clearing-house for the exchange of experiences and opinions of all organisations which were putting the co-operative principle into practice. This has been begun by opening a London centre which, when the Carnegie United Kingdom Trust promised to defray the cost of maintenance, naturally offered hospitality to the Co-operative Reference Library, an offer which the Carnegie United Kingdom Trust approved. Thus the Foundation is in a favourable position to see that Ireland is kept fully informed of the progress of similar movements in other countries.

RELAND, NORTHERN (*see* IRELAND, 14.742), a part of the
ted Kingdom of Great Britain and Ireland, with a certain
sure of local self-government. The population at the census
911 was 1,250,531; at the census of 1926 it was 1,255,881,
ncrease of 5,350. The population of Belfast, the capital, in
5 was 414,844. The area of 3,351,970 statute acres consists of
six counties of Antrim, Down, Londonderry, Armagh, Ty-
and Fermanagh, and the county boroughs of Belfast and
donderry.

I. POLITICAL AND CONSTITUTIONAL HISTORY

nder the Govt. of Ireland Act, 1920, the Lord Lieutenant, in
name of the King, summons, prorogues and dissolves
liament. He gives and withholds the Royal Assent to Bills
sed by the Senate and House of Commons, subject to the
owing limitations:—

) He shall comply with any instructions given by His Majesty
espect of any such bill or order; and
) He shall, if so directed by His Majesty, reserve any such Bill
Order for the signification of His Majesty's pleasure, and a Bill
Order so reserved shall not have any force unless and until within
year from the day on which it was presented to the Lord Lieu-
nt for His Majesty's assent, the Lord Lieutenant makes known
it has received His Majesty's assent.

he Senate consists of the Lord Mayor of Belfast, the Mayor
Londonderry and 24 senators to be elected by the members
he House of Commons; the House of Commons consists of
members; 13 members are returned to represent Northern
and in the Parliament of the United Kingdom. The members
he House of Commons are elected by the same electors and
he same manner as members returned by constituencies in
rthern Ireland to serve in the Parliament of the United
gdom, except that, in any contest election of the full number
members, the election is according to the principle of pro-
tional representation, each elector having one transferable
e. All election laws relating at the time of the passing of the
to the Commons House of Parliament of the United King-
n and the members thereof were, so far as applicable and sub-
to the provisions of the Act, to extend to the House of Com-
ns of Northern Ireland.

Ioney bills can only originate in the House of Commons and
y not be amended by the Senate. If the Senate reject, or
to pass, or pass with amendments to which the House of
nmons will not agree a public bill which is sent up to the
ate at least one month before the end of the session, and if
House of Commons in the next session again pass the bill,
h or without any amendments which have been made or
eed to by the Senate, and the Senate reject or fail to pass it,
pass it with amendments to which the House of Commons
l not agree, provision is made for the holding of a joint session.
ubject to the provisions of the Act, the Parliament has power
erally to make for the peace, order and good government of
rthern Ireland, with the limitations that it shall not have
ver to make laws except in respect of matters exclusively
ting to the portion of Ireland within its jurisdiction. The
own, armed forces, defence of the realm, relations with
eign States and certain other matters were excluded from its
ver. The Parliament cannot make laws interfering with
gious equality, taking property without compensation, etc
All executive power in Northern Ireland continued vested in
King, but exercised by the Lord Lieutenant or other chief
cutive officers for the time being appointed in his place. Certain taxes, such as customs and excise duties, were reserved to the Imperial Parliament; the postal service, post office savings bank, etc., were reserved temporarily, pending the formation of the proposed Irish union. The Act abolished the Supreme Court of Judicature for Ireland, and established the Supreme Court of Judicature of Northern Ireland, consisting of two divisions, the High Court and the Court of Appeal.

Developments After 1920.—A proclamation was issued by the Lord Lieutenant of Ireland (Viscount FitzAlan of Derwent) on May 4 1921 summoning a Parliament of Northern Ireland to meet in Belfast on June 7 following. The election of members of the House of Commons was held on May 24, the Unionists securing 40 seats to 6 Nationalist and 6 Sinn Fein. Elections for the Senate were held on June 12, and 24 Unionists were returned unopposed. The Ulster Unionist Council had on Feb. 4 unanimously elected Sir James Craig as leader of the party. The Nationalist and Sinn Fein members did not attend the opening of Parliament. The Hon. Hugh O'Neill was elected as Speaker of the House of Commons and the Marquess of Dufferin and Ava as Speaker of the Senate. On June 22 Parliament was formally opened by King George V. The first Cabinet was constituted as follows:—

Prime Minister, Sir James Craig.
Minister of Finance, Mr. H. M. Pollock.
Minister of Labour, Mr. J. M. Andrews.
Minister of Home Affairs, Sir R. D. Bates.
Minister of Education, The Marquess of Londonderry.
Minister of Agriculture and Commerce, Mr. E. M. Archdale.

Sir James Craig immediately made it clear that his policy was to preserve the existence of Northern Ireland as an integral part of the United Kingdom, and, while willing to contemplate common action with Southern Ireland under the Government of Ireland Act, to resist union with the rest of Ireland in any system which would involve separation from Great Britain and the abandonment of the representation of Northern Ireland in the Imperial Parliament.

The first task of the Government was to restore internal order. Political and religious animosities, to which unemployment arising from post-War decline in trade and industry had added fuel, had been kindled to a dangerous heat. Outbreaks of civil disorder leading to murder and arson had taken place. The anti-British party in Southern Ireland had undoubtedly contributed to increase the difficulties of the Government, presumably in the hope of forcing an all-Ireland form of government by making government under the Act of 1920 impossible. However, the disruption of this political party, which followed upon the Irish agreement of the winter of 1921–2, accompanied as it was by an outbreak of civil war in Southern Ireland, actually eased the situation in Northern Ireland, as it caused the withdrawal of certain elements of disorder which had been organised and introduced from outside and which were now called off to take part in the quarrels of their leaders.

After the setting up of the provisional Govt. in Southern Ireland, the Royal Irish Constabulary was disbanded under the Constabulary (Ireland) Act, 1922, which received the Royal Assent on Aug. 4 1922 and modified the provisions of the Govt. of Ireland Act by providing for the disbandment of the constabulary, in lieu of the transfer to the Govt. of Northern Ireland of the members of the forces serving in that area. Before this disbandment was completed the Parliament of Northern Ireland had established a new police force, the Royal Ulster Constabulary, and a considerable proportion of disbanded members of the Royal Irish Constabulary received appointments in the new Ulster force. A large body of auxiliary police was also organised and, thanks to vigorous measures both in and out of Parliament, order was restored in a comparatively short time.

The Irish Free State (Agreement) Act, 1922, affected Northern Ireland (although she was not a party to the agreement thereby given legislative sanction) in the following respects:—

(*a*) it purported to give Dominion status to Ireland as a whole;
(*b*) it put a stay upon the exercise of the powers of the Parliament and Govt. of the Irish Free State, as respects Northern Ireland, until the expiration of one month;

(*c*) it enabled Northern Ireland to vote herself out of the Free State by means of an Address presented to His Majesty by both Houses of Parliament of Northern Ireland, before the expiration of the month above referred to, and it attached to the presentation of such an Address the consequence that a Commission was to be set up consisting of three members, one to be appointed by the Govt. of the Irish Free State, one to be appointed by the Govt. of Northern Ireland, and one (who was to be the Chairman) to be appointed by the British Govt., in order to "determine in accordance with the wishes of the inhabitants, so far as may be compatible with economic and geographic conditions, the boundaries between Northern Ireland and the rest of Ireland";

(*d*) it expressly preserved the Council of Ireland and the Irish Free State representation thereon, whilst depriving the Council of any powers in that State; and

(*e*) it offered to Northern Ireland, as an alternative to going out of the Free State, a continued existence under the Govt. of Ireland Act, subject to an overriding jurisdiction of the Parliament and Govt. of the Irish Free State, in all matters in respect of which legislative power is withheld from the Parliament of Northern Ireland under that Act.

The majority of the points in which the Constitution of Northern Ireland was affected by the setting up of the Irish Free State received attention from the Imperial legislature in the Irish Free State (Consequential Provisions) Act, 1922, which came into force on the same day as the Act providing for the Free State Constitution. This Act contained various provisions which were to take effect in the event of Northern Ireland voting herself out of the Irish Free State under Article 12 of the original Agreement. This voting out was immediately accomplished, and thus authority was given for various constitutional changes. Subject to the provisions of the first schedule (Modification of the Govt. of Ireland Act, 1920, etc.) to the Act, the Govt. of Ireland Act was only to apply to Northern Ireland. This schedule provided for the appointment of a Governor of Northern Ireland, and for the application of the provisions of the Govt. of Ireland Act, 1920, with respect to the Lord Lieutenant, to him. Further references in any other enactment to the Lord Lieutenant, were in their application to Northern Ireland, to be construed as references to the Governor of Northern Ireland. A Privy Council of Northern Ireland was to be established and there was to be a Great Seal of Northern Ireland. On Dec. 9 1922 the Duke of Abercorn was appointed Governor of Northern Ireland.

During 1923, in spite of continued trouble with the Free State over the failure to agree on the boundary question, Northern Ireland progressed. The most important legislative achievement of the year was the Education Act, which came into operation, in the face of condiderable hostility, on Oct. 1 1923. Based largely on the recommendation of a committee of enquiry appointed in 1921 under the chairmanship of Sir R. Lynn, M.P., the Act marked a new departure in Irish educational a ministration by establishing the principle of popular contro Provision was made for the establishment of local education au thorities, to be formed by the county borough councils an county councils, with power to appoint administrative sub-area under regional committees. The fiscal separation from the Iris Free State, dating from April 1 1923, had an adverse effect o trade between Northern and Southern Ireland owing to custom duties levied by the Government of the Irish Free State on cer tain goods crossing the land frontier.

Boundary Question.—The chief obstacle to the developme of better relations with the Irish Free State during the year 1923 and 1924 was the boundary question. The Govt. of Northern Ireland declined to appoint a Commissioner under Artic 12 of the Irish Free State (Agreement) Act, 1922, and, as consequence of this refusal, the Irish Free State (Confirmati of Agreement) Act, 1924, was passed by the Imperial Gov whereby, in the event of the continued refusal of the Govt. o Northern Ireland to appoint a Boundary Commissioner, th power of appointment residing in that Govt. was to be transferred to, and exercised by, the British Govt., any Commissione so appointed being deemed to be a Commissioner appointed b the Govt. of Northern Ireland. The British Govt. and the Gov of the Irish Free State had, in the meantime, appointed as the respective Commissioners, Mr. Richard Feetham, a Judge o the High Court of the Union of South Africa, and Prof. J McNeill. Upon the passing of the above Act, the British Gov appointed Mr. J. R. Fisher, barrister-at-law, as the Commissione for Northern Ireland.

The Boundary Commission occupied upwards of a year i visiting, and hearing evidence in, the various border district in Ireland, and in considering the information so obtaine In Nov. 1925, on the eve of the promulgation of the report o the Commission, the Free State Commissioner withdrew. A conference was then held in London between the three Govts represented on the Commission, and a further Agreement wa concluded on Dec. 3 1925. By this Agreement, the Irelan (Confirmation of Agreement) Act, 1925, the three Govts "being united in amity" and "being resolved mutually t aid one another in a spirit of neighbourly comradeship" achieve at length the settlement which is set out in Article 1:—

> The powers conferred by the proviso to Article 12 of the sai Articles of Agreement on the Commission therein mentioned ar hereby revoked, and the extent of Northern Ireland for the purpose of the Govt. of Ireland Act, 1920, and of the said Articles of Agre ment, shall be such as was fixed by sub-section (2) of Section one o that Act.

The Act also provided that April 1 1926 should be the date a from which the powers in relation to Northern Ireland, whic by the Govt. of Ireland Act, 1920, were made powers of the Council of Ireland, were to be transferred to the Parliament and Govt of Northern Ireland. The Constitution of Northern Ireland coul not, before the consummation of this last Agreement, have bee described as being settled with finality. The establishment of a separate legislature has not led to a further differentiation of the law in Northern Ireland from that in other parts of the Unite Kingdom, but to the assimilation of the laws in Northern Ireland to the law in Great Britain, and to the enlargement of the status of the subject in Northern Ireland to that of the subject in Great Britain. It is, perhaps, to this undertaking above al that the Parliament of Northern Ireland, on a study of its statute-book, will be found to have addressed itself with vigour from its earliest inception. (Lo.)

II. FINANCIAL AND ECONOMIC HISTORY

Finance.—The financial provisions of the Govt. of Ireland Act, 1920, were necessarily of a very intricate and comprehensive character, as not only did that Act completely overthrow the whole system of finance in force since the Act of Union o 1800, but went further and set up in Ireland two Exchequers, each under an entirely separate jurisdiction. Subsequent events have considerably modified the operation of the 1920 Act and it is therefore not necessary to deal in this article with

hern Ireland's position as regards the Irish Free State but
ly to consider the relationship which exists under the Act
een Northern Ireland and Great Britain, and the financial
m which has been built up in Ulster since 1921.

e newly constituted State was not granted absolute finan-
autonomy. The Act of 1920 contemplated two distinct
es of revenue, and two classes of expenditure, (1) purely
revenue and expenditure and (2) taxation and expendi-
which by reason of the wider issues involved, should not be
ated to a subsidiary authority. Under the first heading
uch duties as stamp duties, death duties and licence duties,
her with expenditure on services such as old age pensions,
, education, etc., while included in the second category
he more important duties of income tax and customs and
e, and expenditure on the higher administration of justice,
and Commission and certain other services.

venue.—Approximately 90% of the taxes are imposed and
cted by the Imperial Government. In the year 1922–3 the
ue yielded by taxes under the control of the Imperial Govt.
nted to £10,700,000, while the ordinary "transferred" tax
ue amounted to £923,000. This revenue, after deducting
it the cost of the various services reserved to the Imperial
.; together with Ulster's contribution towards Imperial
diture, is remitted to the Exchequer of Northern Ireland,
is used in the ordinary way to meet expenditure on local
ces. As a further source of revenue to meet the "addi-
l expense incidental to the severance of the two Irish
s.," it was provided that the produce of the Land Purchase
ities payable by those agricultural tenants who had
ht out their holdings under the Land Purchase Acts (and
had effected their purchases by the payment of annuities
ding over a period of 65 years) should be transferred to
Northern Government. After making provisions for a
ng fund with the object of ensuring a permanent revenue
this service, these land annuities produce a net revenue
50,000 which should be added to the figures given above.

scal Uniformity.—The control by the Imperial authority
e main sources of revenue requires almost complete fiscal
rmity between Ulster and Great Britain, and necessarily
es that the industrial and general economic policy of the
ince must, in practice, largely conform to that of the
rial Govt., not only in a local sense, but also as regards its
ercial relations with foreign countries. Hence no tariff
ers can be erected between Northern Ireland and Great
in, and the normal flow of merchandise between the two
has continued without the inconveniences and hindrances
ting from the imposition of customs duties.

ntribution to Imperial Expenditure.—The Act of 1920 en-
that the Province should make a fixed statutory con-
tion to "Imperial" services, but this proving unworkable,
s eventually agreed to set up an arbitration committee
, after sitting for two years and having heard expert
nce on both sides, issued its final award in March 1925,
ng the principles upon which Ulster's contribution is in
e to be assessed. In brief, the contribution will be the
ce of revenue over expenditure; for the purpose of making
alculation the taxes over which Ulster has control are to be
med to raise a sum proportionate to the yield of similar
in Britain; while on the expenditure side the Province is
ed for development and social service a sum proportion-
the amounts required by Britain for similar purposes.

luction in Revenue.—The reductions in taxation made by the
cellor of the Imperial Exchequer from time to time in the inter-
g years between 1922 and 1925 have had their reaction on the
ues of Northern Ireland resulting in an annual diminution in
ue of approximately £1,889,000. The severe depression in trade
lso been responsible for a further diminution in revenue; the
yield of the taxes levied in Northern Ireland by the Imperial
falling from £10,562,000 in 1922 to £8,217,000 in 1925. These
tions were naturally reflected in a corresponding decrease in
ntribution which Northern Ireland was able to make towards
st of Imperial services.

lic Debt.—Unhappily the establishment of the Government of
ern Ireland synchronised with the beginning of a period of
nd commercial and industrial depression, with its natural
reaction on employment. The principal industries of the Province—shipbuilding and the linen trade—suffered to an unwonted degree, thus compelling the newly-formed Government to finance the Unemployment Insurance Fund to an extent quite disproportionate to that of Great Britain, whose varied industries scattered over a wide area ensure a greater degree of solvency for its insurance scheme. At the end of the financial year—1924–5—the accumulated deficit of the unemployment fund was approximately £2,300,000.

Capital Funds.—On its establishment the Government of Northern Ireland had received its apportioned share of the different capital funds previously set up in Ireland for administrative purposes, and including amongst others the Church Temporalities Fund, Teachers' Pension Fund, Development Fund, etc. It had in addition created certain other capital and sinking funds. To a very considerable extent the requirements of the Unemployment Insurance Fund and of Local Authorities and others to whom loans were made have been met by the temporary utilisation of this available capital. These sources were, however, insufficient to meet all the demands made on the Government, and a public debt was therefore created by the issue of Ulster Savings Certificates in April 1922, followed by an Ulster Loan Stock issue of £2,000,000 in Nov. 1925. The former issue, guaranteed by the British Govt. and providing a remunerative investment for savings, met with an immediate and sustained response throughout the Province. By March 31 1925 a sum of £1,500,000 (after deducting repayments) had been invested in this way. The proceeds of the Ulster Loan Stock issue are available only for the purposes mentioned in the Government Loans and Exchequer Provisions Act (N.I.) 1925, which do not include the making of advances to the Unemployment Fund. Of the stock £1,000,000 was reserved for the investment of Government funds, the remaining moiety being taken up by public subscription.

The Budget.—Statistics regarding the public finances of Northern Ireland for the year ended March 31 1925 showed a total revenue, including Post Office receipts, of approximately £11,336,000; the total expenditure for the same period amounted to £7,713,000, leaving a balance of revenue over expenditure of £3,623,000. Of this £3,472,000 was contributed to Great Britain, leaving a net surplus of £151,000.

Production and Industry.—Agriculture is one of the principal industries of the country and large quantities of butter, eggs and general agricultural produce are exported to Great Britain. Considerable quantities of flax are also grown and it is expected that the research work now being undertaken in this branch of agriculture will not only improve the quality of the flax but will also greatly stimulate general interest in this product.

During the post-War period the trade in live stock greatly increased. Up to 1926 Ulster had escaped the ravages of foot-and-mouth disease, and indeed was particularly free from outbreaks of animal diseases generally. During 1924 a total of 424,000 cattle, etc., were exported, chiefly to Great Britain.

The main industries of Northern Ireland are the manufacture of linen, shipbuilding, engineering, rope making, and distilling. The linen industry normally employs directly or indirectly approximately 120,000 workers. Over 1,000,000 flax spindles are in use, representing one-third of the world's entire flax-spinning capacity; 40,000 looms are engaged in weaving. The major portion of the shipbuilding industry is located at Belfast, where a large number of the world's most famous vessels have been built, including the well-known "Titanic" and "Olympic." During 1923, 12 mercantile steam vessels with a total tonnage of 75,782 were launched in the North Irish yards.

Over 50 important firms are engaged in Belfast and the immediate vicinity in the manufacture of textile machinery of all kinds; heating, ventilating and drying plants and almost every variety of equipment for factories. There are some 12 modern distilleries operating in Ulster which together produced during the year ended March 31 1924 a total of 2,534,426 proof gallons of spirits. A number of other industries are carried on. Belfast possesses the largest ropeworks in the world, which employ over 3,500 persons and can produce 350 tons per week of all classes of ropes and twines. Tobacco, soap, woollen goods, felt and aerated waters are also manufactured.

Trade.—Northern Ireland carries on a very considerable export trade. Statistics for 1923 show that the value of the exports for that year to Great Britain and foreign countries totalled £66,000,000, while the imports for the corresponding period amounted to £65,000,000.

Finance.—There are three banking companies having their head offices in Northern Ireland, viz.: the Belfast, Ulster and Northern banks. In addition there are several other banks operating in Ulster. The purely North Irish banks have all a close working agreement with one of the leading English Joint Stock Banks. The deposits in these three banks amounted in 1924 to over £48,000,000 while the advances of various descriptions totalled £31,000,000. In addition to these deposits the sums deposited in Trustee and Post Office Savings banks amounted to almost £9,000,000 in 1924. On Dec. 31 1924, there were approximately 1,350 living companies registered in Northern Ireland with a nominal capital of £71,000,000 and a subscribed capital of £59,000,000.

An analysis of the registered capital produces the following results:—

Banking, etc.	£11,000,000
Brewing and distilling	2,250,000
Shipbuilding	13,500,000
Textile manufacturers	21,000,000
Engineering	10,000,000
Others	13,250,000
	£71,000,000

Communications.—The principal ports of Ulster are Belfast, Londonderry, Coleraine and Newry, while in addition there are Royal Harbours at Donaghadee and Ardglass. Of these Belfast is the most important. Belfast Harbour covers 2,287 acres and possesses a total lineal quayage of 26,512 feet. There are in addition, five graving docks, the largest of which is 850 ft. long and 96 ft. wide at the entrance. During 1923 the number of vessels arriving at ports in Northern Ireland totalled 12,383 with an aggregate tonnage of 4,872,225.

Northern Ireland is exceptionally well provided with roads and a very marked increase in the use of motor transport has been noticeable in the post-War period. There were altogether 12,892 m. of roads in 1925 consisting of:—

Main trunk roads and the more important inter-town routes	1,023
Less important inter-town routes	1,111
All other roads	10,758
	12,892

There are seven private railway undertakings situated wholly in Northern Ireland and five others extending into the Irish Free State. The total mileage in Northern Ireland in 1925 was as follows: standard gauge 815 m., narrow gauge 301 miles. The authorised capital of the railways wholly in Ulster is £1,888,757 and of those partly in Ulster and partly in the Free State £11,141,356. The total receipts in 1923 amounted to £1,090,526 in the case of Ulster railways and £2,395,285 in respect of the others. (H. M. P.)

IRISH FREE STATE (SAORSTAT EIREANN).—The Irish Free State, with the status of a British Dominion, came officially into being on Jan. 15 1922, when the Irish Peace Agreement, signed in London on Dec. 6 1921, by the British and Irish Delegations, already ratified by the British Parliament on Dec. 16, was adopted by a meeting of elected members of the Parliament of Southern Ireland convened by Mr. Arthur Griffith. In 1923 the State was admitted a member of the League of Nations. The New State is composed of 26 of the counties and four of the county boroughs of Ireland, and is divided into 269 baronies, 2,165 civil parishes and 51,158 townlands. Its area is 17,019,155 statute ac., and its estimated population in 1925 was 3,163,000.

I. POLITICAL HISTORY

The treaty which led to the creation of the Irish Free State was concluded by the British Govt. with representatives of an Irish Govt. which Great Britain had never recognised. From Jan. 1919, onwards, a large majority of the members of parliament elected for Irish constituencies had styled themselves Dáil Eireann—the Assembly of Ireland—had declared the Irish Republic in existence and had chosen a president and Ministers. In May 1921, when elections were held under the Government of Ireland Act 1920, Republican candidates were returned unopposed for all constituencies outside of Northern Ireland (except that of Dublin University) and for several constituencies in Northern Ireland. The Irish war was then at its height; th
was no civic life in the country and the members chosen w
simply nominees of the Republican Govt., which was in effe
council of the republican army.

This, the second Dáil, met for the first time after the truc
the Dublin Mansion House on Aug. 16 1921. All its memb
took the oath to the Republic. Negotiations with Great Brit
at first conducted by E. de Valera, were resumed by a delegat
headed by Arthur Griffith, "Vice-President of the Republ
and Michael Collins, its Minister of Finance. Great Brita
definite refusal to recognise an independent Irish Republic
been publicly repeated with emphasis.

When the terms of the treaty were published on Dec. 6 1
Mr. de Valera's announcement of his opposition came as a sh
In the Dáil's debate, prolonged until Jan. 8 1922, it was gener
admitted that the country at large was for acceptance. But s
speakers declared that their oath bound them to the Repul
some that the desire for acceptance was merely due to fear of
newed war; some, that to compromise was dishonourable,
that the democracy had no right to do what was morally wr
Many who advocated acceptance made the suggestion
it was a step to the Republic. The majority for acceptance
64 to 57, and when Mr. de Valera resigned the Presiden
Griffith was elected only by two votes. The wording of
decision hardly accepted the facts of the situation: Griffith
chosen President of the "Irish Republic."

The Provisional Government.—Under Article 17 of the tre
it was necessary to appoint a provisional government, and
was done at a meeting in which all members elected for c
stituencies in Southern Ireland were summoned. Opponents
the treaty absented themselves exactly as they had absen
themselves from the British House of Commons; but
four members for Dublin University attended, and decl
that they and those whom they represented were now
a common basis with other citizens of the Free State"
could act whole-heartedly with them for the good of Irel
Eight men were named members of the Provisional Governm
Collins being chairman. Griffith remained outside it. So
Gen. Mulcahy, who had been chief of staff of the Republi
Army and who now succeeded Cathal Brugha as Minister
Defence. In theory the army was still the army of the repu
and the Provisional Govt. had no force at its disposal.

The old constabulary was at once disbanded; it had since
ceased to be in any true sense a police force. Collins and
colleagues decided at once to form a new police, the Civic Gu
but it necessarily took time to organise, and its creators ha
cided in principle that it should be unarmed. British troops
rapidly evacuating the country, and those who had won
treaty felt it impossible to use support from this quarter. Th
was the Irish Army, now largely in uniform; but it soon beca
clear that the Army was a source of danger.

With the exception of Collins, only one man in the Provisi
Govt. was widely known in Ireland. This was Professor
MacNeill, for many years vice-president of the Gaelic Leag
who gained a new prominence at the close of 1913 as chief
moter of the Irish Volunteers and afterwards, from Sept. 1
as their chief of staff. Of the others, Mr. William Cosgra
Minister for Local Govt., had been a prominent member o
Dublin Corporation from 1913 on, and in 1917 was returned
Sinn Fein Member of Parliament. Mr. Duggan had been on
the signatories to the treaty. The others, Mr. K. O'Hig
Mr. J. Magrath, Mr. F. Lynch and Mr. P. J. Hogan were
young men with their careers yet to come. Mr. O'Higgins
thus described the situation: "The Provisional Govt.
simply eight young men in the City Hall" (where they met
first) "standing amidst the ruins of one administration, with
foundations of another not yet laid, and with wild men scre
ing through the keyhole."

Collins, a man of immense resource and energy, sought
strengthen his position by the success which would have
appealed to popular sentiment—the reunion of Ireland. Un
the treaty, if Northern Ireland consented, all powers retained

province by the Parliament at Westminster would pass to
'arliament of the Free State. Interviews with Sir James
;, the Ulster Prime Minister, were arranged. Settlement was
ible for North as well as South, since in Belfast there raged
rderous strife between Catholic and Protestant; but no
nmodation proved possible. The birth of the Free State
hus not unattended with difficulty.

th Griffith and Collins desired a general declaration from
ountry by an election. But the republicans, knowing as
as they what the result would be, resisted this, and Mr. de
a called instead, on Feb. 21, a convention of delegates of the
Sinn Fein organisation. At this meeting, Collins, seeing
a vote would go against him, consented to delay the election
t least three months and not to hold it till the draft of a
itution, based on the treaty, had been published.

ere was some disorder. Control of the republican move-
did not rest with Mr. de Valera; a section of officers in the
, headed by Mr. Rory O'Connor, who had directed en-
ring operations in the campaign of destruction during the
illa war, demanded the right to be consulted on the terms
y settlement. Meetings of this body were held in express
nce of orders in Dublin. Mutinous action was taken at
nel, where a store of arms was seized. This was followed by
rper outbreak at Limerick, where a body of troops occupied
arracks in the name of the republic. The officer commanding
ne Free State in the region was ready and anxious to act,
Collins, desirous at all costs to avoid war, caused an accom-
ation to be patched up.

eanwhile, Mr. de Valera proclaimed at meetings that there
only one legitimate Government in Ireland—that of the
blic. There was no law, and in parts of the south much
nce was offered to Protestants, nominally in reprisal for
ks on Catholics in Belfast, while raids across the border
the north intensified the danger of war. In March, Sir
y Wilson, who on retirement had entered Parliament for an
r seat, was put in charge of the Ulster defences, and organ-
the whole Protestant male population as an armed police.
outhern Ireland, the extremist Republican party definitely
ed renewal of war with England. They would stop at nothing
eir efforts to smash the treaty and their armed bands still

r-cars.

appeared from his public utterances that President Griffith
ed drastic action; but Michael Collins, the head of the
isional Govt., whose personal hold was stronger still, com-
ised, and on May 20 announced that he had reached agree-
with Mr. de Valera. An election was to be held, but Free
rs and Republicans were to put forward a joint panel of
idates, so arranged as to reproduce the distribution of views
e existing Dáil. After the election a coalition ministry was
formed, giving Mr. de Valera four seats in nine. The result
e election was not to be considered as a vote on the treaty.
al was made jointly that no other Candidates be selected.
organised Labour insisted on putting forward candidates,
other interests took courage to follow their example. Michael
ns, at Cork, publicly advised the people to vote as they
e. There resulted some appearance of a free election in
constituencies, where the polling took place on June 16.
ty-four candidates not on the agreed panel were elected—
ipporting the treaty. The Republican defeat was evident.

vil War.—Aggressive actions by the mutinous section of the
followed, and on June 22 Sir Henry Wilson was murdered
ondon by two Irishmen who had served in the British army.
British Govt. made it clear that the Free State must
A definite cause of action was afforded when the mutineers
ured in Dublin the assistant chief of staff of the Free State
y and held him as a hostage. On June 28 the Four Courts
quarters were summoned to surrender, and on refusal
was laid. So the disturbance began. After eight days'
ing—so local in character that the city's ordinary life went
the struggle in Dublin was over. Rory O'Connor was cap-
l after he had blown up the Four Courts with all their records. Mr. de Valera, who had joined the insurgents, escaped, but Cathal Brugha, after ordering his post to surrender, dashed out firing and was shot down.

Some districts of the country south and west was held by Republicans. The Government's army had neither a trained staff nor a system of supply: it had to improvise. But it had a few field guns to which, when brought into action, no resistance was offered. It was able to enlist practically as many ex-soldiers as it chose, but it refused to accept the offered service of professional officers who had held high command. Some ex-subalterns and company commanders, who had joined the I.R.A. in its fight against the British police, became generals. But the main successes in the field were due to General Murphy, a county surveyor who had got a commission early in the World War and ended by commanding a brigade.

To civil administration was now added military activity; five members of the Government took rank as generals, and Collins himself, flinging his whole energy into the struggle which he had so long sought to avoid became commander-in-chief. But on Aug. 12 Arthur Griffith died suddenly. Ten days later, on the 22nd, Michael Collins was killed in an ambush in the Co. Cork. Thus the task of establishing the Free State fell not to any man but to a group, representing a fraction of one section of the Irish people—the right wing of Sinn Fein.

Framing the Constitution.—It was necessary under the treaty that the third Dáil should as a provisional parliament frame a constitution which should also be adopted by the British Parliament before Dec. 6 1922. On Sept. 9 it was possible to summon this body to meet in Leinster House, the premises of the Royal Dublin Society, which contained a fine semi-circular concert hall. In the newly built College of Science, almost contiguous, the Government had established their offices. The block of buildings was placed under guard. None but carefully scrutinised representatives of the Press assisted at the nominally public debates. Under these conditions the Irish Parliament and Irish Govt. operated for nearly a year. Ministers lived as in a fortress.

At the Dáil's first meeting Mr. Cosgrave was elected President of the Irish Free State and he assumed the Ministry of Finance. Eleven ministers, proposed by him, were elected by the Dáil. The Dáil sat persistently to fulfil its task. The clauses of the constitution, which defined the relations between the Irish Free State and the British Crown and imperial defence, had been settled in discussion between Arthur Griffith and the British Govt., and to this extent freedom was limited. Ministers had the task of persuading the Dáil to accept the limitation; they had also to put forward their own proposals for all that was left free. Mr. Cosgrave entrusted exposition and defence very largely to Mr. Kevin O'Higgins, assisted by Mr. Ernest Blythe, who had become the minister for Local Govt., and Mr. Hogan, Minister for Agriculture. For legal advice they depended on the Attorney General, Mr. Hugh Kennedy, who was not then a member of the Dáil. The only constitutional lawyer in the assembly was Mr. Gerald FitzGibbon, one of the four members for Trinity College. His intervention in the debates was always received with great respect, and Mr. Cosgrave more than once recognised the steady goodwill of this little group of ex-unionists.

The constitution followed extreme democratic lines. Adult suffrage was adopted. But the political thought of the Dáil resented any departure from British models. Ministers desired to introduce the Swiss system of individual responsibility for ministers; a compromise was reached establishing one class of "extern" ministers who should be nominated and appointed by the Dáil at large, holding office for the duration of parliament, and at the same time a statutory executive council of not less than five nor more than seven, which must include the President and the Minister for Finance. Members of the executive council were vested with collective responsibility, and would fall as a body if the Government failed to obtain the support of Parliament while the "extern" ministers would remain in their posts. The referendum and power to initiate legislation by a popular vote were incorporated in the constitution, but without any sign of enthusiasm for these novelties.

The Restoration of Public Order.—The Dáil's real importance was that it brought back to Ireland some habit of public discussion by its criticism of the action of the executive. From 1919 onwards there had been a grave upset to civic life. The civil courts did not sit outside of Dublin; the press existed under a dual censorship—that of the British Govt. and that of the I.R.A. The old police force had been transformed into an irregular military force when the Free State came into being, for so long as open civil war could be said to exist the public and the Parliament acquiesced in the fact of military rule. But by the end of Sept. 1924 at latest, there were no formed forces of the irregulars in the field, and all towns were held for the Government. Demand began to be heard for courts to which men could bring their causes. But the essential was to restore order. Property of all kinds was assailed. Whole bands of men in the name of the Republic were commandeering what they required. Much private robbery followed. More serious than all, a trouble which had broken out in 1920, and had been repressed by Sinn Fein, now appeared again. The permanent land-hunger awoke, and even holdings which had been purchased under the Land Acts were invaded by rival claimants.

Courts were long in being framed, partly because the Govt. sought to find competent magistrates able to use Irish, which the constitution had declared to be the national language. The Civic Guard was being organised; but gunmen flouted, beat and in certain cases killed, members of this unarmed force. Mr. O'Higgins, Minister for Justice, however, stood resolutely to his principle: Ireland must be taught to regard the police, not as the agents of an outside power, but as its own servants, needing and deserving public assistance. He took a long view, and the issue has justified it; but for immediate purposes this body was useless. The irregulars were adopting against the Irish Govt. those tactics which the I.R.A. had used to make British Govt. impossible. The Government on its side was driven like the British to enrol a large force of soldiers, which finally exceeded 40,000. Its recruits joined a force without tradition of discipline; indeed, at the outset it professed semi-officially to condemn the ceremonies of saluting and other formalities. Such a force, hastily levied, with officers as untrained as the men, was not over trustworthy, and did not always give satisfaction by its conduct to the public for whose protection it was raised.

Neither was Ireland, at the close of a movement extending over more than 40 years, a country easily able to support government in the face of terrorism; and terror was applied. The ministry was slow to counter this menace. Trial by jury was futile in such a state of things. The gaols were crammed with prisoners, untried and unpunished. Power to try and to punish most drastically by court-martial was given by an act of the Dáil; yet till Nov. fear of the irregulars was stronger than fear of the Govt. throughout the country. At last a proclamation was posted announcing that four men had been tried, convicted and executed—in each case for having a revolver without licence. In the following week seven men were sentenced, on precisely the same charge, to long terms of penal servitude. Thus the right of Government to deal at its will with persons in arms against the state had been asserted. But the irregular campaign of wreckage went on. More executions followed, among them that of Erskine Childers, who had been the most powerful influence over Mr. de Valera. There was no improvement perceptible by Dec. 6, when the Irish constitution was formally ratified by both parliaments.

Formal Inauguration of the Free State.—Immediately this ratification was complete, Northern Ireland notified the British Govt., by address of both Houses of Parliament, that exercising its right under article 12 of the treaty, it refused to come under the Free State, and desired to retain its position created by the Act. The Free State being now formally constituted as a "Dominion," sensation was created by the appointment (Dec. 1922) of Mr. T. M. Healy, K.C.—so notable in the land war which preceded Home Rule—as its first Governor-General. He was duly sworn in on Dec. 7 by the new Lord Chief Justice. Next day, when the Dáil assembled to choose a senate, as provided by the constitution, President Cosgrave announced that one member of the Dáil had been shot dead and another woun on the way to the meeting. The man killed, General Hales, a popular hero of the guerrilla war, and next morning four of leading irregulars who were in prison were shot without trial way of reprisal. Among them was Mr. Rory O'Connor. All th had been arrested long before the proclamation of martial l Mr. FitzGibbon deplored the action. Let the Government for what powers they liked and he would support them, bu them abide within their legal rights. General Mulcahy's just cation of the step was not given till some months later, when pointed out that no other member of the Dáil had been tacked. In fact, the counter-terror succeeded. It was larg carried out with the assistance of a criminal investigation partment, armed police operating in plain clothes, over who as representing Cabinet responsibility, Mr. Joseph Magrath, Minister for Labour, presided.

The activities of the Free State Government were thus vigorous and drastic as those of the British police in Sir Ham Greenwood's régime, but there was this difference. The coun might now be terrorised into silence by the irregulars, but gave them no such willing support as it had given to the I.R Information came, surreptitiously but steadily, to the Free St troops. Further, in Dublin, where courts were now in sessi juries did their duty fearlessly. Evacuation by the Brit military, which had been suspended in early summer when t worst dangers threatened, was now completed; the division, c centrated near Dublin, embarked in Dec. 1922 among demo strations of affectionate goodwill from the populace.

In forming the senate, President Cosgrave nominated one h of the 60 members; the Dáil elected the other 30. The Presid made good the promise given by President Griffith to leadi Irish Unionists that they should be generously treated; nominations comprised several leading landlords and other pro inent Protestants. The Senate when constituted chose as chairman Lord Glenavy, who as Sir James Campbell had be Sir Edward Carson's chief lieutenant.

No cleric of any denomination was included in the body. Fr the first, self-governing Ireland ignored the power of the Chur A few days after the Provisional Govt. assumed office, witho any public announcement or legislative act, the two nominat boards which had controlled primary and secondary educati were notified that they were dispensed with. This was the mo significant, because the Catholic hierarchy as well as the Pro estant churches were represented on both. Thus, in the mi of revolution, education was taken out of the hands of the cler who had (by a series of compromises) indirectly controlled under the British administration.

There was not the least opposition to these steps. Pub criticism had virtually ceased to exist; the clergy were dumb the laity, but all men doubted whether the new governme could secure obedience. The most hopeful factor in the situati was that since the irregulars had been forced to concentra their forces against the Free State Army, and provocation fro them in Ulster no longer afforded justification for outrageo attacks on Catholics, Sir James Craig's government had succe ed in establishing order, though under a strict military contro Patrols of police enforced curfew all over the six counties.

In the rest of Ireland, the gravest danger was that forseen Michael Collins when he pointed out that criminal folly mig destroy "our belief in ourselves as a nation." There was orgy of destruction, which almost paralysed communication road and rail: houses were burnt or bombed by dozens, and th Government, once started on their path of severities, pursu it ruthlessly. By the end of Jan. executions had risen to 50, an the prisoners to ten thousand. No government could be popul under such conditions. Yet signs of weakening began to sho By May 1923, Mr. de Valera called upon his followers to abando hostilities and dump their arms in concealment. The sound firing was no longer heard in the streets, and public meetings we once more held. When Aug. brought the annual Horse sho ministers were seen moving freely in the crowd. The resumptio of normal civic life may be dated from this time.

April a marking fact had occurred: the Free State, still
aining and collecting the British system of taxes, found it
ary to set up a customs system at the ports and along the
border. The first object was merely ascertainment of
ie, but the machinery for a protective tariff existed. In
the Minister for Agriculture introduced a measure for the
etion of land purchase, and this was carried through
y. The third Dáil, which had passed the constitution, still ex-
but a general election on the new register with adult suffrage
emanded and it was fixed for the last days of August. The
of this trial of strength was curious. The Government's
had exposed it to much odium. Some 10,000 prisoners
letained in gaol, mostly untried, and over 70 men had been
ted. Yet President Cosgrave, Mr. O'Higgins and General
hy were each returned by huge majorities at the head of
oup in which they stood. But Mr. de Valera also headed
oll in County Clare (Professor MacNeill being second on
st) and his deputy in County Mayo defeated another minis-

he various groups of Independents were notably increased.
ese supported the treaty and the constitution. By Oct. the
parliament was formally opened with a speech from the
rnor General. His predecessor, Lord FitzAlan, the last lord
nant, had given assent to the action of ministers while
ng the constitution and crushing civil war. It was Mr.
's lot to represent the Crown during the reorganisation.

e *New Government.*—Ireland's accession to her new status
ractically signified on Sept. 10 1923 when her representatives
heir place with acclamation in the council of the League of
ns. A month later Mr. Cosgrave attended the Dominion
rence in London, where he was warmly welcomed. At
the executive council was for the first time constituted, con-
g of seven. Four other ministers were chosen as "extern,"
g individual, not collective, responsibility. These included
ostmaster General and the Ministers for Agriculture, for
ries and for Local Government. The last post was vacated
r. Ernest Blythe, who now became Minister for Finance.
ccessor, Mr. Burke, was little known.

e new Minister for Finance had at once to face a serious
ion. It had become clear that the State would not be
oyed by violence—there was fear lest it should be bank-
. Civil war had produced damages, then reckoned at
0,000, though, when compensation came to be paid, the
duced itself to about ten. But the army was costing over
0,000 a year, and taxation stood at the peak point to which
Britain had raised it. Business men in the Senate urged
the financial situation should be regularised. In Dec. the
rnment came to the country for a loan of £10,000,000 at
-the issue figure being 95, repayable at par in twenty years.
s oversubscribed in ten days, the subscribers numbering
22,000. This demonstration of confidence greatly cheered
ountry, and rounded off the satisfaction felt in comparing
ettled order of Christmas 1923, with the ruinous anarchy in
the year opened.

t this optimism did not last. The year 1924 was a very
ppy period. Organised resistance to the State was with-
n but the threat of it remained. Mr. de Valera's followers
ed to surrender or hand in their army. More than this, Ire-
was forced to realise how profoundly demoralisation had
d during a period in which law was defied and secret
isations enforced their mandates. There was much crime,
ially robbery with violence. The army, so rapidly raised,
reduced, for motives of economy, with equal rapidity, and
were suddenly thrown out of employment. A bad harvest
23 had left acute financial depression, and work was scarce.
while many political difficulties threatened. Hitherto no
had been taken to give effect to the provision in article 12
treaty under which, if Northern Ireland decided to remain
le the Free State, a commission of three was to be appointed
letermine in accordance with the wishes of the inhabitants,
as may be compatible with economic and geographic conditions, the boundaries between Northern Ireland and the rest of Ireland." But with the cessation of civil war Mr. Cosgrave's Government was pressed to demand its application. Immediately threats came from Ulster of resistance by force to the cession of a single inch of territory. Mr. MacDonald's Government attempted to settle the matter by private negotiation, but this failed. The Free State named Professor MacNeill as their representative on the commission; but Northern Ireland refused to make any appointment or recognise the commission in any way. In these circumstances, Mr. J. H. Thomas had much difficulty in finding a chairman. A pledge had been given that he should be a citizen of one of the dominions. Finally, Mr. Justice Feetham, a South African judge, consented to act. But Northern Ireland contended that in that representation, unless they themselves appointed a member, the constitution of the commission would in fact be void.

Threatened Mutiny.—A still more menacing situation arose in March 1924. A group of highly placed officers in the army issued a public demand to the Government that their opinions and interests should be consulted in framing public policy, and they withdrew themselves from duty. Steps were taken to place them under arrest as mutineers, and a fresh outbreak of fighting was narrowly averted, mainly by the personal efforts of Mr. Joseph Magrath, Minister for Labour. Angry debate followed in the Dáil, in which General Mulcahy declared that a secret society had for over a year existed in the army, and that the mutinous officers belonged to it. Mr. Magrath reported that the Fenian Society, or I.R.B., had also its adherents in the army, who influenced promotion in their own interest. The upshot was the resignation of Mr. Magrath, followed by that of General Mulcahy. Mr. Cosgrave in person assumed the post of Minister of Defence. The chief of staff, adjutant-general and quartermaster-general were dismissed. General Mulcahy as a private member moved a vote of censure on the government for these dismissals, but got no support in the Dáil. Mr. Magrath, followed by several other members, who had been prominent first against the British and later against the irregulars, resigned their seats—thus presenting to the country the spectacle of dissensions in the army and dissensions in that section of the original Sinn Fein party which provided and supported the government.

Legislation.—Added to all this was the unpopularity of the government's measures. Mr. Blythe reduced old age pensions from ten shillings to nine shillings. Taxation was severely levied; tenants in default with their land purchase annuities were forced to pay up; citizens who had withheld their income tax during the last years of the British administration, with Sinn Fein's approval, were now called upon for their arrears. More widely felt was the innovation of a customs barrier, causing delay in the delivery of goods; and, in addition, Mr. Blythe decided to embark experimentally on a measure of protection, its main function being a duty of 15% on imported boots.

In this, as in all else, government virtually acted entirely on their own initiative. The Oireachtas (or parliament) indeed had to endorse their acts, but since the republican delegates did not take their seats there was no powerful opposition nor any sustained criticism. Ireland had been traditionally concerned with politics in the abstract; concrete questions (except concerning land tenure) had never occupied the public mind. Thus, legislation was the work of the government, not of the parliament; and there was a great deal of it. Long before his second year of office was completed the Governor General had given his assent to over 100 bills. Many of these were temporary and provisional, but some were of the first importance. One of them indeed was not solely the work of the executive. In framing the new judicial system, government had the advice of a committee over which Lord Glenavy presided. The number of judges and their salaries were reduced, the office of Lord Chancellor disappeared; a supreme court was constituted and a high court, both sitting in Dublin. High court judges no longer went on circuit; a new order of circuit judges was instituted. As regards the magistracy, unpaid justices of the peace were abolished, and stipendiary district justices were appointed to cover the whole country.

Judges of the previous régime were free to retire on rather more than four-fifths of their salary, and most of them did so. In making the new appointments the Government showed a fine disregard of political record, and totally ignored religious differences. By 1925, five out of the nine high court judges were Protestants and several had been strong Unionists—for example, Mr. FitzGibbon, who became Lord Chief Justice. The effect of this was to confirm the allegiance already promised by the minority in the Free State; and from leading members of it, notably from divines of the Church of Ireland and of the Presbyterian Church, testimony was offered to the impartiality of the Government.

Yet one part of the legislative and administrative programme occasioned protests from the minority. The constitution had declared that the national language was Gaelic, which perhaps 10% of the existing population used in their homes. The Ministry of Education endeavoured to revive the national language by an intensive campaign in the schools, offering a much higher rate of endowment to those schools where Irish was not only a subject of teaching but the medium of it. Protestants, even when they desired to see Irish studied and preserved, regarded these provisions as unfair. Many of them, however, considered the whole study as a waste of time and money; and unquestionably many Catholics were of the same opinion. This was one great cause of the Government's growing unpopularity.

Yet the more unpopular the Government grew, the more people were forced to see that no alternative to it existed, and there was agreement on the necessity for some force to stand between the citizens and a relapse into anarchy. Ministers showed little disposition to win support by conciliating public feeling. They had succeeded by desperate courage in coming through when the State reeled about them, and they persevered in following out their own ideas. Mr. O'Higgins forced on a drastic bill to restrict the facilities for buying and selling drink; at another moment, with half a score of by-elections pending, he suppressed "goose clubs," a widespread form of Christmas sweepstakes. Mr. Burke, the new minister for local government, by simple administrative act suppressed the corporations of Dublin and Cork and put civic affairs into the hands of commissioners, young men not very well known. There was some outcry, but the country had got into the habit of taking orders; and presently, when the commissioners produced improved administration and reduced the inordinate rates, this experiment was approved. Outside the towns, the ministry abolished district councils, thus throwing more work on the county councils. A tendency to centralisation and even to bureaucratic administration showed itself in all directions.

Such a policy made enemies everywhere, and the weather was no friend to Mr. Cosgrave. A second bad season in 1924 hit the farmers hard, and Mr. Blythe was still levying taxes that were now actually higher than the British scale; for the reduction of income tax from 5/- to 4/6 in 1924 was not followed in the Free State. Also the post office had always been a losing service in Ireland. The new postmaster greatly cut down the public facilities, and kept the stamp at 2d when it was 1½d in Great Britain, and therefore in Northern Ireland. In short, if there had been any alternative ministry the Government would have fallen, but there was none: and the bellicose protestations of republicans kept them in power. Another thing assisted them: when a turn in English politics replaced a Labour Ministry by a strong Tory Government, English ministers kept faith absolutely with Ireland. The difficulty about constituting the boundary commission had been referred by Mr. MacDonald's Government to the Judicial Committee of the Privy Council, which found that without a new Act of Parliament enabling the Imperial Government to appoint a commissioner to represent Northern Ireland nothing could be done.

Parliament was summoned on Sept. 30 instead of on Oct. 28, as had been originally intended, in order to pass through its stages the Irish Free State (Confirmation of Agreement) bill, which had been introduced by the Government at the end of the session. The defeat of the Labour Government on another issue was not allowed to prejudice the Irish settlement, and just be
the dissolution the bill was passed by the House of Lords
received the Royal Assent. In the House of Lords, Lord Ca
had moved an amendment that confirmation of the bill als
required from the Parliament in Northern Ireland, but in
interests of peace was persuaded to withdraw the amendm
and contented himself with the fact that his protest had
entered in the records of the House. A well-known publi
from Ulster, was appointed; and the commissioners after
preliminaries in London proceeded to investigate opinion on
border itself during several months in 1925 without the l
disturbance. In the meanwhile, from many quarters, but not
from Mr. Cosgrave and his ministers, came utterances to
effect that there was no intention of coercing Ulster. She
choose her own time for uniting, if she chose, with the res
Ireland. This indicated a departure from the expectations
out by Michael Collins after the treaty was signed, for he
Ireland to hope that the commission's award would transfe
much territory to the Free State that Northern Ireland w
not be able to maintain its separate status.

At the opening of 1925 a group of by-elections showed defi
support for the Government, and Mr. Blythe's budget of A
marked an advance. He reduced the income tax by a shil
and he extended materially the area of protection, claiming
the tariffs already imposed had led to increased employmen
the boot trade and minor industries. Broadly, all clothing
ported ready made was now subjected to taxation.

This budget really marks the beginning of normal fina
The liabilities for compensation for damage were at last as
tained, amounting to less than £10,500,000, of which u
£4,000,000 remained to be paid. The army charge was red
to something over £3,000,000. Mr. Blythe considered anyt
over £2,000,000 as abnormal, but necessary in view of the
tinuing republican menace. The State's normal expenditure
estimated at £24,000,000 and the revenue at £26,000,000.
normal expenditure for compensation and the rest he propo
to meet by borrowing.

But it soon became apparent that the ministry were not
posing a mere negative policy of economy, and early in 1925
committed themselves to a project of utilising the Shannon
SHANNON) for a vast electric power scheme. Nor did this st
alone. By promise of a subsidy amounting to a total of
£1,000,000 a Belgian firm was induced to start the sugar
industry on a large scale, Carlow being chosen as the sit
the central factory. Simultaneously came a whole group of
posals for the development of Irish industry and Irish agri
ture, which had been interminably discussed in and out of
liament during the British régime. They stood committed
policy of industrial development, having as the pivot of
whole an enterprise so colossal that its possibility had never
been seriously considered under the old order. In the mean
tranquillity returned to the country so completely that it seem
dull. Tourists refilled their old haunts in summer; the Du
Horse Show enlarged its scope.

The Boundary Question.—In the late autumn a new
threatened not only its prestige but its existence. The report
the boundary commission was awaited without emotion, tho
a London newspaper published a forecast of its decision diffe
widely from any anticipations that had been formed in the
State. No plebiscite had been taken;[1] the article gave no inst
tions for holding one; and it was (rightly) assumed that
commissioners would take it Roman Catholics desired inclu
in the Free State and Protestants inclusion in Northern Irel
Three important towns, Derry, Enniskillen and Newry had
regarded as possible subjects of transfer to the Free
because in all three Catholics were in a majority. In Ne
the proportion was 70%. In two of the border counties,
rone and Fermanagh, Catholics were about 55% of the wh

[1] Under Article 12 of the Treaty the wishes of the inhabita
were to be considered subject to geographic and economic
siderations.

: no county was transferred as a whole; and the cession to
'ree State of districts (for the most part very poor) in Ar-
ı, Fermanagh and Tyrone was offset by the transfer of a
ɔart of East Donegal. There was a fierce outcry, and Presi-
Cosgrave in response to it reiterated the Free State's con-
ɔn that the commission was only entitled to transfer to
natural destination those parts of the six counties whose
ɔitants desired to be in the general body of Ireland. He
ıasised also that the claim to Newry was in his opinion in-
sible. These declarations were followed by the announce-
that the Free State representation had withdrawn from
ommission. Professor MacNeill followed this up by resign-
is post on the executive council, and in the Dáil explained
after hearing the evidence he had agreed, for the general
to sign a unanimous report whose terms were "not dis-
ır" to the unauthorised forecast. He had never taken his
ıgues in the ministry into his confidence at any point in the
of the commission. But now in view of the expression of
ɔn he felt that adding his signature to such a finding would
embarrass his colleagues and not produce a settlement.

th the Government and Professor MacNeill were attacked
great violence in the Dáil and outside it. The Republican
r came into new prominence. Mr. Cosgrave refused to
ıit himself publicly to any line of action, and went to Lon-
Meanwhile it came to be generally admitted that no mem-
f the commission could invalidate the finding by refusing to
he report; that the award then issued had immediate effect
v, and that the Free State minority had declared willingness
lvance to accept the award. On the other hand, it was
y declared that any attempt to transfer Free State territory
ɔrthern Ireland would be resisted by arms.

London, however, negotiations proceeded, and Sir James
; was summoned from Ulster; and on Dec. 3, a fortnight
Professor MacNeill's resignation, a new agreement was
uded and made public, to which not only Great Britain and
'ree States were parties, but Northern Ireland also. It was
d that the award of the commission should not be published
hat the existing boundary should stand. This gave to Ul-
ıll that Ulster claimed, but it gave to Ireland the repose of
ty. Further, the treaty was altered by the cancellation of
le 5, under which Ireland assumed liability for the public
of the United Kingdom as existing in 1921 "in such pro-
ɔn as may be fair and equitable, having regard to any just
s on the part of Ireland by way of set off on counter claims."
at once liberated the Irish exchequer from an undefined
ing liability injurious to its borrowing power, while it wiped
ıe British books what most people regarded as an irrecover-
asset. Ireland, however, undertook to repay to Great
in compensation already paid for war damages in the period
21, and to add 10% to the compensation awarded to
ıants for damages suffered in the civil war from 1922 on.
total cost to Ireland was estimated at under £5,000,000.

gislation embodying the terms of this agreement was car-
without difficulty in Great Britain, and the Northern Par-
ənt expressed its satisfaction. But in the Dáil President
rave was angrily opposed by the Labour party and by some
s own followers. Attempts were made by Labour to induce
ıblican members to come into the Dáil for the purpose of
king the agreement, but they failed, and after much talk
Bill was carried by 71 to 20. Business men as a whole re-
ed the issue as fortunate for Ireland, which now definitely
me a country with a total national debt of under £20,000,000
less than a gross revenue. Other sections found their chief
action, as did President Cosgrave, in the changed relation
e government concerned, indicated in the preamble:—

> e British Govt. and the Government of the Free State being
> d in amity with the Government of Northern Ireland and being
> ved mutually to aid one another in a spirit of neighbourly com-
> hip, hereby agree . . .

immediate consequence was the disbandment of the Ulster
al police in two of its three branches. There could be no
er proof that a great cause of danger to Ireland has been
definitely removed. It is also plain that while the conduct of this business by President Cosgrave and his colleagues has been criticised, the policy of those who desired to tear up the settlement ran counter to the public desire. The Irish Govt. has been therefore strengthened by a difficulty which threatened its destruction.

II. THE CONSTITUTION

The present political status of the Irish Free State is that of a co-equal member of the community of nations forming the British Commonwealth. It has a written constitution which rests on the provisions of an Act passed by Dáil Eireann sitting as a constituent assembly in the autumn of 1922, entitled an "Act to enact a constitution for the Irish Free State (Saorstát Eireann) and for implementing the treaty between Great Britain and Ireland signed at London on the 6th day of Dec. 1921."[1]

It is provided in this Act that the Constitution shall be construed with reference to the Treaty and that if any provision of the constitution or of any amendment thereof or of any law made thereunder is in any respect repugnant to any of the provisions of the treaty, it shall, to the extent of such repugnancy, be void and inoperative. It is also provided that to the extent to which they are not inconsistent with the constitution all laws in force in the Free State at the time of passing of the constitution are to continue to have full force and effect until repealed or amended by the Oireachtas.

In conformity with practice in the British Commonwealth the executive authority is vested in the King. The governor-general represents and fulfils the functions of the Crown. He is appointed "in like manner as the governor-general of Canada and in accordance with the practice observed in the making of such appointments"—which ensures that the Government of the Free State shall be consulted before any appointment is made. His powers are strictly limited as in the case of the Sovereign in Great Britain, all executive acts being done on the advice of the executive council. The latter consists of not more than seven nor less than five ministers, and is directly responsible to Dáil Eireann, retiring from office when it has ceased to retain the support of a majority of deputies.

Dáil Eireann may not at any time be dissolved except on the advice of the executive council, and Article 53 of the Constitution provides that the Oireachtas shall not be dissolved on the advice of an executive council which has ceased to retain the support of a majority in Dáil Eireann. The Parliament of the Free State cannot therefore be dissolved except with its own consent. The maximum life of a parliament is four years. The president of the Executive council, who is appointed on the nomination of Dáil Eireann, nominates the vice-president and the other ministers who form the Executive Council. The council is collectively responsible for all matters concerning the departments of state administered by its members.

Other ministers, however, who shall not be members of the executive council, may be appointed on the nomination of committee of Dáil Eireann, and these ministers are directly and individually responsible to the Dáil for the administration of their departments. Members of the executive must be members of Dáil Eireann, but this provision does not apply to other ministers. The legislature, known as the Oireachtas, consists of the King and two Houses, Dáil Eireann (the Chamber of Deputies) and Seanad Eireann (the Senate). In the Oireachtas is vested "the sole and executive power of making laws for the peace, order and good government of the Irish Free State."

---

[1] The Royal Assent was given to the Act passed by the Imperial Parliament to give effect to the Irish Free State Constitution on Dec. 5 1922, and on the next day the King signed the proclamation announcing the adoption of the Constitution.

The Senate.—Seanad Eireann is composed of 60 members, the term of office of each member being 12 years. One-fourth of the members are elected every three years by proportional representation, the whole of the Free State forming one electoral area. At every election a panel of candidates is formed, consisting of three times as many persons as there are senators to be elected. Two-thirds of the panel is nominated by the Dáil, and one-third by the Seanad. In addition to these all persons who have at any time been senators have a right to be added to the panel if they so desire. Candidates, who must have reached the age of 35 years, are chosen on the ground that they " have done honour to the nation by reason of useful public service or that, because of special qualifications or attainments, they represent important aspects of the nation's life." Casual vacancies in the Seanad are filled by co-option, and co-opted members retire at the next triennial election.

The Chamber of Deputies.—Dáil Eireann (the Chamber of Deputies) is composed of members directly elected by constituencies determined by law. The number of members at present is 153. This number may, however, be varied from time to time, but shall not be fixed at less than one member for each 30,000 or more than one member for each 20,000 of the population of the State. In addition each university elects three members. As in the case of the Seanad, election to the Dáil is carried out on the system of proportional representation.

All citizens, without distinction of sex, who have reached the age of 21 years and who comply with the electoral laws, have the right to vote for members of Dáil Eireann, and all citizens who have reached the age of 30 years and who similarly comply with the electoral laws have the right to vote for members of Seanad Eireann. Voting is by secret ballot, and no voter may exercise more than one vote at any election.

Members of both Houses receive an allowance for expenses which is fixed at £360 per annum. Every member of the Oireachtas must take the following oath before taking his seat:—

> I............do solemnly swear true faith and allegiance to the constitution of the Irish Free State as by law established, and that I will be faithful to H. M. King George V., his heirs and successors by law, in virtue of the common citizenship of Ireland with Great Britain and her adherence to and membership of the group of Nations forming the British Commonwealth of Nations.

Powers of the Senate.—The powers of Seanad Eireann are limited. It has no authority to amend a money bill, but may make recommendations to Dáil Eireann regarding such bill within 21 days after a bill certified to be a money bill has been passed by Dáil Eireann. The definition of a money bill given in article 35 of the constitution is adopted from the United Kingdom " Parliament " Act of 1911. There is a proviso that the decision of the chairman of Dáil Eireann as to whether the bill is or is not a money bill may be appealed against before a committee consisting of three members of each House presided over by a judge of the Supreme Court. The Seanad may reject or amend all other bills, and may initiate legislation, but a bill passed by the Dáil which has not been passed by the Seanad 270 days after it was first sent to the Seanad is deemed to have been passed by both Houses in the form in which it was last passed by Dáil Eireann. Any bill passed or deemed to have been passed by both Houses may be suspended for a period of 90 days on the written demand of two-fifths of the members of Dáil Eireann or of a majority of the members of Seanad Eireann presented to the President of the executive council not later than seven days from the day on which such bill shall have been so passed or deemed to have been so passed. During the period of suspension the bill shall be submitted to a referendum if so demanded by one-twentieth of the voters on the register or by three-fifths of the members of the Seanad. These provisions do not apply to money bills or to bills declared by both Houses to be necessary for the immediate preservation of the public peace, health or safety.

Defence.—The Oireachtas has the exclusive right of raising and maintaining armed forces in the Free State, but under the provision of the treaty the army shall not exceed in size such proportion of the army in Great Britain as that which the population of Ireland bears to the population of Great Britain. Save in the case of actual invasion the Irish Free State shall not be committed to actual participation in any war without the assent of the Oireachtas.

Nationality, etc.—Every person domiciled in the Free State at the time of the coming into operation of the constitution, who was born in Ireland or either of whose parents was born in Ireland, or who has been ordinarily resident in the area of the jurisdiction of the Free State for not less than seven years is entitled to citizenship in the Free State. No title of honour in respect of services rendered in the Free State may be conferred on any citizen without the consen the executive council. Freedom of conscience and the free fession and practice of religion are, subject to public order morality, guaranteed to every citizen. No law may be made endow any religion or to give any preference or to impose disability on account of religious belief. No discrimination may made as respects state aid between schools under the managem of different religious denominations.

Court of Appeal.—The constitution provides that the Supr Court of the Free State is a court of final appeal and that its deci shall not be reviewed by any other court, tribunal or autho whatsoever, provided that nothing in the constitution shall im the right of any person to petition His Majesty for special leave appeal to His Majesty in council or the right of His Majesty to gr such leave. There is no provision, however, that decisions by King in council shall be binding on Irish Courts.

The judges of the Supreme Court and of the High Court an all other courts established in pursuance of the constitution can be removed for stated misbehaviour or incapacity and then only resolutions passed by both houses of the Oireachtas. See J. Swift McNeill, *Studies in the Constitution of the Irish Free* (Dublin, 1925). (J. G. D.

III. DEFENCE

The evacuation of the British garrisons from Free State te tory began with the ratification of the Anglo-Irish Treaty Dáil Eireann in Jan. 1922. Dublin was held until the treaty finally confirmed 11 months later, and then handed over to tachments of the Irish Republican Army which had given herence to the Provisional Government.

Administration.—As a result of an inquiry into the civil which began in June 1922, and the mutiny of March 19 changes were made in army administration. The command chief is now vested in the executive council and exercised throu out in the name of the Minister of Defence who, however, not allocate to himself any executive military command. H assisted by a council of defence, composed of a civil member ing as Parliamentary Secretary to the Minister and responsi for the finance of the Defence Forces, and by three milit members, the chief of staff, the adjutant-general and the qu termaster-general, whose business it is to deal with traini organisation, equipment and discipline.

The Army Vote for the year ending March 1926 was £3,0 774, and the strength of the forces amounted to 1,053 offi and 16,187 non-commissioned officers and men. The Free St is divided into four military districts—the Eastern, Western Southern Commands, and the Curragh camp where all recru undergo their training. Head-quarters of the three comma are at Dublin, Athlone and Cork, and are in charge of ma generals. There are nine brigade districts, and the infantry organised in 27 battalions. The remaining services are artillery, armoured car, engineers, signal, military police, medi and transport Corks, a school of music and a military col There is an Irish-speaking battalion and all officers and n commissioned officers are instructed in giving and receiving exe tive words of command in both Gaelic and English. The stren of the Air Force is 18 officers, 131 other ranks and 18 machi

Defence Provisions of the Treaty.—Under the Irish treaty was agreed, with a view to securing the international limitat of armaments, that the Irish Defence Forces should not exc in relation to military establishments maintained in Gr Britain the proportion which the population of Ireland bears that of Great Britain. The treaty also provides that defe by sea of Great Britain and Ireland shall be undertaken by perial forces. After five years from the date of the treaty (D 6 1921) a conference is to be held with a view to Ireland und taking a share of her own coastal defences. Harbour defen at Berehaven, Queenstown and Lough Swilly remain in cha of British care and maintenance parties. In time of war strained relations with a foreign power the Free State is pled to afford such harbour and other facilities as the British Go may require for purposes of defence. (J. W. Go

IV. EDUCATION

Since taking control, the Government of the Irish Free St has carried through changes in the educational system.

The first step was to unify control over educational matters der a Minister for Education. This involved the abolition of e three independent bodies through which, previous to 1922, ucation in Ireland was financed. The powers exercised by the ard of National Education were at once taken over by the ee State Ministry. The programme for primary schools has en considerably modified with a view to making it simple, ncentrated and national. Attention is concentrated on funda- ntal subjects, Irish, English, reading, writing and arithmetic. ovision is made for studying local needs in applying this pro- amme in any given locality. The salary question had already en satisfactorily settled under the British régime.

As regards tenure and method of appointment of teachers the l managerial system, under which the power of appointment d dismissal lay, under certain limitations, with the manager the school (usually a clergyman) has been retained. This stem means that each religious denomination controls the pointment of teachers in schools attended by the children of at denomination. The old " National " system provided for mbined literary and moral and separate religious instruction r pupils of different religions. The regulations provide that portunities must be afforded to the pupils of all schools for ceiving such religious instruction as their parents or guardian prove. Religious instruction is given at a time not counted hen computing attendance, and does not come under the super- sion of the officers of the Department. An outstanding defect herited from the old régime, the absence of any real system of mpulsory education, will be rectified at an early date. A bill scribed by the president of the Free State Executive as " of a astic type " has been laid before the Oireachtas.

Important changes with regard to the training of teachers are ing introduced. It is proposed to establish six preparatory lleges for candidates for the training colleges, five of these are be situated in those districts in which Gaelic is still a living nguage, and staffed with teachers capable of teaching the sec- dary school programme entirely through the medium of Irish. this way the future teachers will enter the training colleges fluent speakers, and having passed through a complete secon- ry course given in Irish. Thus a supply of teachers will be cured capable of carrying through the Department's programme r primary schools, aiming at the restoration of Irish as the rnacular.

Secondary Education.—As regards secondary education a ider problem confronted the Government. The administration the funds devoted to this branch was still hampered by the ause of the Intermediate Education Act of 1878 which pre- ribed that results fees were to be paid to schools on the results a general public examination. A system, advocated by the termediate Board in its Report of 1916 and by the Viceregal ommittee on Secondary Education set up in 1918, has been rought into operation by the present Government. Payment results has been replaced by a capitation grant, dependent n the reports of inspectors, who will take into account every ature of the school. The old rigid system with its fixed pro- ramme has been replaced by freedom, and examinations have een reduced to their proper place.

A salary scheme for teachers in secondary schools has been ut into force. Under it, men teachers are to receive from state nds 10 annual increments of £12 each, and subsequently six nnual increments of £15 each, while women receive 12 annual crements of £10 each. Holders of an honours degree of an rish or British university receive additional increments.

The Intermediate Education Board was replaced by two com- issioners in June 1923; and as from April 1 1925 their functions ere transferred to the Minister for Education. The funds pro- ided by the Act of 1878 and subsequent Acts for secondary lucation were transferred to the Department of Finance. In ture education in the Free State will be financed out of sums nnually voted by Parliament. Technical instruction has been laced under the control of the Minister for Education, retaining he organisation under local committees.

In 1925 there were 5,636 primary schools in the Irish Free State, with a total of about 500,000 pupils, and 286 secondary schools providing for 25,600 pupils. There were also 60 technical schools, with 21,800 pupils; 5 training colleges for primary teachers, with 820 teachers in training; while the names on the register of secondary teachers numbered 2,083.[1] (W. F. B)

V: ECONOMIC AND FINANCIAL HISTORY

The area of the Free State is 17,019,155 statute acres, made up as follows in 1918:—

Area under	Statute acres
Crops	4,406,105
Grass	7,775,137
Mountain lands, grazed	2,124,190
Mountain lands, barren	466,272
Woods and plantations	248,878
Turf bog	766,353
Marsh	339,297
Water, roads, fences town and building ground, etc.	89[illegible],523

In 1914, the valuation of the rural districts was £8,741,631 and of the urban districts £2,391,170, the total valuation being £11,132,801.

Population.—The last census of Ireland was taken in 1911. In 1911 the population of the 26 counties composing the Free State was 3,139,688, being 71·5% of the total population of Ireland; in 1925 it was estimated at 3,163,000.

In 1924, the number of marriages registered was 14,822, being 4·69 per 1,000 of the population, the number of births was 63,402, being 20·06 per 1,000 of the population, and the number of deaths was 45,180, being 14·29 per 1,000 of the population. While the reduction in the mortality from tuberculosis has been steady and continuous for many years, the death rate from cancer is increasing. Of the total deaths at all ages 15·2% were deaths of children under five years of age, and the number of deaths of infants under one year was equivalent to a rate of 7·2% of the birthrate. Infantile mortality is decreasing year by year.

Practically no emigration took place from Ireland during the War. It is estimated that the number of emigrants to " places out of Europe and not within the Mediterranean Sea " was 15,000 in 1922, 20,570 in 1923, and 19,077 in 1924. Of the emigrants in 1924, 12,016 were bound for the United States, 5,237 for British North America, 1,138 for Australia, 192 for New Zealand, 160 for British South Africa, 112 for India and 222 for other countries. The population of the Free State is overwhelmingly rural. There are only two towns with more than 50,000 inhabitants, namely, Dublin and Cork, and two others with more than 20,000, namely, Limerick and Waterford.

In 1911 the population of the 26 counties now forming the Free State contained 2,812,509 Roman Catholics, 249,535 members of the Church of Ireland, 45,058 Presbyterians and 3,805 Jews. The great majority of the population were English-speaking, but 16,869 spoke Irish only, and 536,848 were bi-lingual. Of persons aged nine years and upwards, 260,694 could neither read nor write, and 74,001 could read but could not write. The number of houses in the 26 counties in 1911 was 642,541, or one house for 4·88 inhabitants.

Agriculture.—The total acreage under crops was 3,832,240 in 1922; 3,739,146 in 1923; and 3,783,823 in 1924. The following are figures of acreage under crops and numbers of livestock in the Free State in 1922–3–4:—

Crops	1922	1923	1924
Wheat	34,469	31,764	27,465
Oats	813,970	785,939	756,313
Barley and bere	167,765	151,309	163,642
Rye	6,142	6,414	6,424
Beans and peas	447	428	408
Flax	4,915	8,066	10,499
Fruit	10,924	10,795	10,652
Hay	2,062,694	2,026,841	2,099,639
Live Stock	**1922**	**1923**	**1924**
Cattle	4,326,294	4,215,253	4,194,189
Sheep	3,067,473	2,994,420	3,127,921
Pigs	919,449	1,555,905	937,814
Goats and kids	192,298	195,022	193,484
Horses used in agriculture	306,552	312,410	308,552
Unbroken horses	122,549	96,888	79,988
Mules and jennets	25,276	23,919	23,160
Asses	221,991	220,468	218,439

There are 442,606 agricultural holdings, of which 86,033 are less than one acre, 223,991 above one and not exceeding 30 acres, 130,807 above 30 and not exceeding 500 acres and 1,775 above 500 acres.

---

[1] *Annual Report of the Department of Education* (April 1926).

Unpublished official figures show that the percentage of land ploughed varies inversely with the size of the holding; that for equal acres of crops and pasture, the number of livestock (especially milch cows, pigs and poultry, and excepting sheep) rapidly increases as the size of the holding diminishes; and that the larger the percentage of land tilled, the larger the number of animals supported.

The cultivation of cereal crops plays a comparatively unimportant part in the agricultural economy of the Free State, and the bulk of the attention of the farmer is devoted to the raising of stock. As between the production of beef and of dairy produce, conditions vary in different parts of the country. In certain areas the soil, climate and type of holding favour the production of dairy breeds; in others beef breeds are predominant.

In accordance with detailed recommendations made by the Commission which reported in 1924, an Act was passed (No. 35 of 1924) providing for the testing, grading and packing of exported eggs, for the prohibition of the export of dirty or bad eggs, and for the registration of all premises where grading, packing or preserving is carried on. Another Act (No. 58 of 1924) made elaborate provision for the regulation of the butter trade. Butter can now be exported only by registered creameries, factories or exporters, and must be packed and marked in a specified manner. The most minute regulation of creameries and factories is insisted on, and provision is made for the establishment at a later date of a national mark or brand for creamery butter. The licensing of bulls was made compulsory by another statute (No. 3 of 1925). This measure, together with the Government's scheme for providing premium bulls and boars and for subsidising the purchase of pedigree rams, has resulted in levelling up the standard of the livestock in the country. Owing to the acute agricultural depression in 1924, power was given to county councils to abate rates on agricultural land for the year ending March 31 1925 and the budget of 1925 provided for the doubling of the agricultural grant.

Early in 1925 serious losses were sustained by farmers in many districts as a result of the prevalence of fluke disease. The Government supplied farmers in the affected areas with cheap supplies of suitable medicine and granted credit facilities to assist in the restocking of farms. £100,000 was provided from public funds for the purpose of making loans through the channel of co-operative credit societies in the districts concerned.

Land Purchase.—The total amount of the purchase money for which advances have been made under the Land Purchase Acts of 1870–1909 in respect of lands in the Free State is £99,110,046, the total area comprised in the sales being 11,159,356 acres. In addition, there are pending proceedings for which agreements for purchase had been entered into under the acts of 1903–9 representing a purchase money of £830,000 and an area of 120,000 acres. The British Govt. assumed responsibility for the completion of all sales pending at the date of the Treaty.

The Land Act of 1923 aimed at attaining the dual object of completing land purchase and relieving congestion. This Act provided for the creation of land bonds, bearing interest at the rate of 4½% in which all payments to landlords and encumbrancers were to be made. These bonds were later guaranteed, as to principal and interest, by the British Government. Advances made to purchasers were to be repaid by an annuity at the rate of 4¾% of the amount advanced, and the price to be paid was roughly equal to about 15 years purchase of the value of the holding, of which the Government contributed 10% in relief of the tenant. Very wide powers were given to the Land Commission to acquire untenanted land for the creation of holdings in relief of congestion, and to consolidate and exchange holdings with the same object.

The area of untenanted land already acquired by the Land Commission and the late Congested Districts Board and utilised for the relief of congestion amounts to 820,000 acres. Advances were authorised to be made to tenants of uneconomic holdings, tenants exchanging their holdings, persons who had been evicted and labourers who had lost their employment through the progress of land purchase. The money required by the Land Commission for making roads, fences, drains, etc., and for erection of buildings on newly created holdings is provided out of public funds, and so much as the Land Commission decides can be repaid by the purchasers is made repayable by them along with their purchase annuities. All arrears of rent due before the first gale day of 1920 were wiped out; but rent due after that date (subject to 25% reduction) was made recoverable.

It is estimated that advances amounting to £30,000,000 will b required to complete land purchase under the 1923 Act. As regard tenanted land, holdings situated on 6,000 estates have to be deal with, while as regards untenanted land, the Land Commission ha inspected or is making inquiries in respect of 750,000 acres, with a view to their acquisition for the purpose of distribution; and of thi area the Land Commission has acquired or entered into agreement for the acquisition of over 100,000 acres.

Congested Districts Board.—The Congested Districts Board wa dissolved in 1923 and its functions transferred to the Irish Lan Commission. (Land Law, (Commission) Act, 1923, No. 27 of 1923. By the Ministries Act of 1923 the agricultural and land branches o the Congested Districts Board were put under the Minister o Agriculture and the fisheries and rural industries branches under th Minister of Fisheries.

Fisheries.—The work formerly done by the Department of Agriculture and the Congested Districts Board in connection wit the fisheries and with rural industries has now been transferred to a separate Ministry, whose policy is to develop the deep sea fisheri and to organise the home demand for fish, which is at present ver small. The Government is helping the fisheries by making loans fo boats and gear, erecting and maintaining curing stations, and subsidising fishery schools. A brand for mackerel has been institute One urgent requirement is being delayed for financial reasons, namel a second patrol boat to keep the coast free from the numerou foreign trespassers who at present infest it.

Manufacturers.—Ireland was, even before partition, an overwhelmingly agricultural country, but the predominance of agriculture became greater than ever after the exclusion of the six countie The Agricultural Commission reckoned that three-quarters of the rea wealth produced in the Free State is farm produce. Too great dependence upon any one industry is always undesirable, and the government has taken steps to redress the unequal balance betwee the agricultural and manufacturing industries. The object aimed a by the government's policy is the development, not of large-scale urban industries, but of rural industries, especially those concerne with the working up of agricultural produce.

The treaty left the Free State at liberty to frame its tariff policy as it chose. There was a widespread popular belief that Irish industry could best be revived by the adoption of a high protectionist tariff, and the Government appointed a small committee of economists to inquire into the probable effects of protective duties. The report of this committee was strongly free trade in tone. It pointe out the numerous factors, besides external competition, that operate to retard the growth of industry in Ireland. The necessity for a dominantly agricultural country of the lowest possible prices of raw material and consumable commodities was pointed out. Nevertheless the Government proceeded to institute a number of experiments in protection.

The Finance Act of 1924 imposed a duty of 3⅗d per lb. on sugar confectionery, of 6d per lb. on cocoa preparations, of 10% ad valorem on candles, 15% ad valorem on boots and shoes, 33⅓% on glass bottles (not white glass) and 10% ad valorem on soap. The McKenna duties were altered so as to provide encouragement for the building of commercial motor bodies, and the imperial preference on manufactured tobacco was abolished. The Finance Act of 1925 went a good deal further in the same direction, but the Minister for Finance declared that the new duties were purely experimental in nature. This Act imposed a duty of 15% ad valorem on clothing, wearing apparel, blankets, and blanketing, and 33⅓% on bedsteads and wooden furniture; the duty on bottles was extended, and an additional duty of 10% was put on toilet soaps. On the setting up of the customs barrier in 1923 the manufacture of tobacco automatically secured a small measure of protection. The only corresponding steps taken in the direction of free trade were the repeal of the Dyestuffs Import Regulation Act, the Safeguarding of Industries Act, and the McKenna duties on gramophone records.

At the same time, some important revenue duties were abolished or reduced. It would appear, however, from the cost of living index numbers that the result of the new tariff (in conjunction with other causes, such as high wages and a bad system of retail distribution) has been to prevent the cost of living in the Free State from being reduced at the same rate as in Great Britain. This is shown by the following table:—

Cost of Living Index Numbers (*Basis: July 1914=100*)

Month	Free State			Great Britain and Northern Ireland		
	1923	1924	1925	1923	1924	1925
January	190	188	195	178	177	180
April	181	178	188	174	173	175
July	180	183	188	169	170	173
October	186	193	188	175	176	176

In addition to giving the protective assistance outlined above, the Government has endeavoured to encourage industry by means of subsidies, the development of cheap sources of power, and the pro-on of credit facilities. The growth of sugar beet and the manu- ure of beet sugar were encouraged by the grant of a subsidy able for 10 years to persons manufacturing in the Free State ar from home-grown sugar beet. A large Belgian-Czechoslovak- group, encouraged by the subsidy, has arranged to open a ar beet factory in Carlow.

n important attempt is also being made to provide the Irish ufacturer with cheap power. The Government sought the ad- of Messrs. Siemens-Schückert, who drew up a scheme for ising the great water power of the Shannon (*q.v.*). Another hod by which the Government attempted to encourage industry by helping enterprises to obtain capital on easy terms under the de Loans Guarantee Act (No. 41 of 1924). The maximum amount t might be advanced under Government guarantee under the Act fixed at £750,000. The Minister was further authorised to grant o guarantee loans proposed to be raised by any public authority ny association of producers or consumers "calculated to promote duction in the retail prices in Saorstát Eireann of essential com- lities." The maximum grant under this action was limited to ,000, and the maximum grant and guarantee together to £250,000. an amending Act (No. 19 of 1925) the period in which this stance might be rendered was extended; and the Finance Act of 5 provided for the advance of £300,000 to the National Land k for the purpose of trade loan guarantees. Finally the Ministry ndustry and Commerce has set up advisory committees in more n 30 of the principal industries to assist the Government in ac- ring information and in forming policy.

anking.—All the banks having their head offices in the Free te have numerous branches in Northern Ireland, and two of the fast banks have numerous southern branches. Shortly after the ty, the Belfast Bank, which is affiliated with the Midland Bank, its branches situated in the Free State to the Royal Bank of land. The Free State Government holds all the shares in the tional Land Bank. The Government's banking business, with a minor exceptions, is transacted by the Bank of Ireland. The ricultural Commission recommended the formation of a depart- nt for granting long term loans to farmers to be capitalised by the sting banks jointly, but this recommendation has not been fol- ed. Recently, there has been formed a company known as the lustrial Investment Trust for the purpose of affording financial istance to industry by means of long term loans. The National n, both as regards principal and interest, is repayable in sterling, are also the bonds created under the Land Purchase Act. The horised issue of the six Irish banks of note issue is £6,352,000, and average circulation of these banks' notes in May, 1925, was ,364,000, against which £10,688,000 was in gold and silver coin.

rade.—The customs barrier between the Free State and Northern land was set up in April 1923, but it was not until the beginning the following year that accurate values of imports and exports re obtained. The trade figures for 1924 are as follows:—

Class	Imports 1924 £	Exports 1924 £
1. Food, drink and tobacco	29,523,000	41,549,000
2. Other raw materials	6,314,000	2,490,000
3. Other manufactured goods	29,204,000	2,593,000
4. Live animals not for food	770,000	1,816,000
Totals	65,811,000	48,448,000

During the first nine months of 1925 the value of imports was 5,225,383, of exports £29,623,566 and of re-exports £814,034. It is probable that, if a full account of the international bal- ce of indebtedness were obtainable, it would appear that the visible items would more than make up for the adverse visible de balance. Very large sums are received from British and reign investments, and from emigrants' remittances from nerica. On the other hand, the Free State remits large sums account of land purchase annuities and pensions. There is sign, as far as can be gathered from banking or stock exchange urces, that the Free State is living on its capital.

Communications.—In 1914, there were in Ireland 28 railway com- nies operating 3,454 miles of line. The Irish railways were placed der the control of the British Government in 1917 and were re- sed in August, 1921, a few months before the treaty. During the ntrol period, the net receipts for 1913 were guaranteed, and on the ssation of control the Government paid the railways £3,000,000 in ll settlement of all claims. Meanwhile, wages had been raised by out 200%, while freight and passenger rates had been raised only 120 and 100% respectively. The resulting difficulties led to the ilways Act of 1924, modelled on the British Act of 1921, for nalgamating all the lines situated wholly in the Free State. On n. 1 1925, came into being the new Great Southern Railway, mprising all the companies in the Free State but excluding the eat Northern Railway (Ireland), which is partially situated in orthern Ireland. The average weekly receipts of the Great Southern Railway in 1925 were £12,500 lower than in 1924; and the interim dividends on the ordinary and preference shares due to be declared in July were passed. All classes of stock have fallen heavily in the market. The conditions which prevail in the Free State render the competition of the road vehicle very formidable; the average journey is short, and many places in the country are several miles from a railway station. The number of motor vehicles and cycles increased in two years from 22,240 to 36,836.

Finance.—The following table shows the revenue and expenditure of the Free State from 1922 to 1925:—

Year	Revenue	Expenditure	Deficit
	£	£	£
1922–3	28,611,600	31,395,589	2,783,989
1923–4	31,869,628	42,792,312	10,922,684
1924–5	27,542,200	29,718,631	2,176,631

The Minister of Finance, in introducing the 1925 budget, stated that the total amount payable out of the public funds of the Free State in respect of compensation for property losses and personal injuries, both pre-truce and post-truce, would not exceed £10,300,000, a considerably lower figure than had been at one time anticipated. Compensation for pre-truce damage would amount to about £7,660,000, towards which Great Britain would contribute about £3,560,000; and the damage committed after the truce would account for about £6,100,000. When the abnormal army expenses had been reckoned, and the consequential losses to trade and industry taken into account, the civil war had cost the people at least £30,000,000. In view of the greatly improved condition of the national finances, he proposed to meet about £6,000,000 of the estimated expenditure of £30,000,000 for 1925–6 by borrowing, as it was of an abnormal and non-recurrent character, and to relieve the taxpayer by lowering the income tax and making large reductions in indirect taxation.

Public Debt.—In Nov. 1923, the Irish Free State floated its first loan. The nominal amount raised by this loan was £10,000,000. The interest offered was 5% and the issue prices 95, the flat yield being thus about 5¼%. The loan is redeemable at par between 1935 and 1945. The Minister of Finance authorised the statement that both principal and interest would be paid in sterling. The loan was a great success, being oversubscribed in the Free State; no part of it was underwritten or taken by the banks. Provision was shortly afterwards made for the satisfaction of persons who had contributed to the official Sinn Fein loans floated during the Anglo-Irish fighting. Irish subscribers were to receive savings certificates, and subscribers elsewhere were to have their holdings redeemed.

The indebtedness of the Free State on Nov. 28 1925, was £13,483,693, made up as follows: Ways and means advances by public departments, £1,530,000; annuities under Telegraph Acts, £202,944; savings certificates, £1,488,000; national loan, £9,760,859; compensation stock, £501,850. The price of the national loan on Jan. 9 1925 was 98¾ and of compensation stock 93⅝. The agreement made between the British and Free State governments in Dec. 1925, provided that the outstanding liabilities of the Free State under the treaty in respect of the British National Debt should be settled by an annual payment of £250,000 for a period of 60 years.

Taxation.—The system of taxation in operation at the time of the treaty was taken over and, owing to the difficult financial situation created by the civil war, no reductions were attempted for a couple of years. In the years 1923–4 and 1924–5 the income tax was maintained at the rate of 5s., and the corporation profits tax was retained. In both these respects, the Free State taxes were higher than the British. The budget of 1924 reduced the super tax on very high incomes, and reduced the tea duty from 8d. to 5d. per pound. In 1925 the income tax was reduced to the British rate of 4s., and the exemption limit to corporation profits tax was raised. The duty on sugar was considerably reduced and imperial preference in that commodity discontinued, and the duties on tea, coffee, cocoa and chicory were abolished. The relief which the taxpayer might have derived from these concessions was counterbalanced by the burden of the new protective duties.

In addition to the sums raised by national taxes, the following sums were raised by local taxation: Year ending March 1922, £6,762,672; March 1923, £4,153,060; March 1924, £5,327,341.

The total (national and local) taxation amounts to £8 19s. 5d. per head of the population and the public debt amounts to £4 5s. 3d. per head. The debt is equal to 58·4% of the annual revenue.

(G. O'B.)

IRISH LANGUAGE (*see* 5.622).—It is difficult to say with any certainty how far the Irish language has maintained itself in Ireland since 1910. The action of Dáil Eireann in making it the official language of their first meeting, nothing else being spoken on that day, gave a great stimulus to it in popular estimation. The Dáil did not, however, live up to the headline thus set. Speeches there are seldom made in Irish, and practically never in the Senate, where not a dozen, perhaps not more than half a dozen of the 60 Senators could understand, much less speak it. It was decided, however, that all legislation must be passed in both English and Irish, and an efficient staff of Irish scholars and translators was retained for this purpose.

Several books written in Irish were translated into German, Swedish and Norwegian. Dr. Pokorny of Berlin published translations of some of Pearse's, O'Conaire's and O'Siochfhradha's stories under the not very felicitous title of *Die Seele Irlands* (Max Niemeter, Halle, Saale). From this book the reader will get a good idea of the short story in contemporary Irish literature. Dr. von Sydow of Lund University translated Father O'Leary's novel *Séadna* into Swedish. Käte Müller-Lisowski published, with notes and introduction, in 1923 a volume containing 39 Irish folk-tales. She had previously translated Dr. Hyde's "True Storyteller of the Week." Dr. Reidar Christiansen also published an illustrated volume of Irish folk-tales in Norwegian.

Irish was recognised as the national language by the Dáil, and a corollary to this recognition seemed to be that it should be taught in the primary schools of the Free State, and so far as the schools are concerned the Government made great efforts to Gaelicise them. Naturally one of the principal difficulties that the new Government had to face was the fact that the great majority of the teachers were not qualified to teach Irish, much less to use it as a medium for teaching. With a view to remedying this, annual courses for the training of teachers in Irish were established in 1922. The courses for primary teachers extended over eight weeks in 1922, five weeks in 1923 and four weeks in 1924. Approximately 12,000 teachers attended annually at about 180 centres or colleges. The cost in 1922 was £76,000; in 1923, £66,000; in 1924, £42,500; and in 1925 about £45,000. Similar courses were held for about four weeks in each of the years 1922–3–4–5, at a cost of between £3,000 and £4,000 per year, for teachers employed in secondary schools.

Formerly many people might have been noticed, especially young men and women, wearing a gold ring on their dress in the streets of the bigger cities and towns. This was to show that they spoke Irish and wished to be addressed in that language. It was observed that many of these people came to a violent end, and the wearing of this ring was consequently to some extent discontinued. It is significant that after the formation of the Free State the wearing of this ring was largely resumed. For examinations held under the auspices of the civil service commission in the Irish Free State Irish was made an essential subject. Indeed, it seems certain that a knowledge of Irish will be in future years a necessity for all aspirants to Government posts and that no young man who does not know something about it will be looked upon as properly educated. From 1927–8 forward Irish is to be compulsory in all secondary schools.

Finally, it may be said that whilst the reading, writing and speaking of the Irish language increased very much during this period in the towns, amongst the cultured classes in the north-west, west and south, where it was naturally spoken, it did not fare so well; in many of these places barely holding its own against English. (D. Hy.)

IRISH LITERATURE: ENGLISH (*see* 5.622).—The literary revival in Ireland was the first evidence of a resurgent national spirit. It had its origin in the study of the older heroic literatu and of the folk poetry which still existed in Irish.

Poetry.—Its first expression was in poetry which retained th double mark of its origin set in W. B. Yeats' work to a standa of well-nigh perfect artistry and marked in George Russell's ("Æ writings with a profound consciousness of the divine origin a destiny of man. In time the poets broke away from folk theme which were becoming a mannerism but not before Padraic Colu had written verses of grave, deliberate beauty and Joseph Campbell had used similar material effectively but not without sophistication.

By 1910 the group of young poets, whose association in *Ne Songs* (1904) gave the appearance of a school, had broken bounds Seumas O'Sullivan had perfected his fastidious art and begu to show the shift of interest from country to town together wit a new and mordant note. A transition to prose marked the passing of youth and the coming of age of the movement. Movemen now it could hardly be called. It had become a diverse development of personality. James Stephens' *Insurrections* (1909) ma be taken as the turning point. Passing indifferently from poetr to prose and back again, reincarnating in both forms and in modern spirit the old prose sagas or the 17th century poetry O'Bruadar, O'Rathaille and Keating, passing from *The Charwoman's Daughter*, a Dublin slum idyll, to the riotous inventio of the *Crock of Gold* and *Demi-Gods*, and exhibiting at each tur the same leaping, exuberant fancy and the same wise and witt humanity, Stephens fitly represents the transition from the olde generation and the growing attraction to prose.

One mentions the poets of the Rebellion, Pearse, MacDonagh and Plunkett, executed in 1916, the tragic intensity of Dora Sigerson Shorter and the name of Francis Ledwidge, killed i Flanders in 1917, whose verse is lit throughout with sudde glimpses of natural beauty. Since their date one powerful poeti talent has appeared with Austin Clarke, whose eager imagination is fitly exercised in epic subjects. F. R. Higgins has writte some charming verses but his output is still too small to writ of him with assurance. Equally limited but more derivative i the work of H. Stuart in whom the later rhythms of W. B. Yeats are faintly echoed.

Prose.—The transition to prose synchronised with growing pre-occupation with public affairs. Æ's prose of imaginative revery sharpened in his attempt, *The National Being*, to shape a national polity and to bring back the thoughts of his countrymen from the frontiers and surfaces of political controversy to their spiritual base. His book has left its imprint on the Irish Constitution. In *The Interpreters*, written when political controversy had come to an issue, he breaks away characteristically from the passing shows of things to track political moods back to spiritual origins and "to relate the politics of Time to the politics of Eternity." Here and in *The Candle of Vision*, a book of pure mysticism, where he explores the creative imagination in an attempt to discover the operation of the divine imagination in the mind of the individual artist, George Russell's prose reaches its height. The chief stimulating literary influence of his period, and always more interested in life than in the shadows of life. Æ's work reconciles the superficial conflict of national and universal art. The aim of the former was clearly expressed in the writings of Pearse and MacDonagh—Pearse in his *Irish Anthology* and in a remarkable series of pamphlets, the most effective political writing since John Mitchell's, and MaDonagh in his analysis of Gaelic verse-forms and the Irish way of speech on Anglo-Irish literature. This form of criticism, the result of the language movement, has been reinforced by Daniel Corkery in a study of the Irish schools of the 17th and 18th centuries and is a growing formative influence on the younger writers.

The rebellion of 1916 played an inevitable part in the novels of this period, of which Eimar O'Duffy's are the most notable, but the psychology of its participants is best studied in Corkery's short stories, wherein whoever cares for the artistic presentation of a passionate human struggle will find a clear glass. His single novel, *The Threshold of Quiet*, written before 1916, is a study in

y and self-immolation, a shadow-play in whose penumbra
racters dwell in intense if quiet reality. The other signifi-
ovel of this period is Colum's *Castle Conquer*. The prema-
ath of Seumas O'Kelly was a grave loss to Irish literature;
aver's Grave is the best short story that has come out of
l. Succeeding disillusions born of civil war is expressed
recent work of Liam O'Flaherty, where a powerful crea-
culty atones for much brutality. There remains the unique
of James Joyce, the delicately stepping grace of whose
er Music is in singular contrast to his experimental,
hous prose.

ma.—John M. Synge, the outstanding dramatist of the
Theatre, died in 1910. He founded no school, his tragic
ation was not hereditable, and without that inheritance
ld be grotesque parody to imitate his manner of imaged,
coloured speech. Colum was the earliest of the peasant
rights; his best play, *Thomas Muskerry*, was produced at
bey in the year of Synge's death, and it was to his idiom
he new dramatists returned. Colum studied the peasant
tion to his surroundings. His fable was always significant,
nstruction taut and solid, his dialogue unforced. St. John
treated of certain situations peculiar to North East Ul-
ith some effectiveness, but most of the newcomers devel-
nly the genre study of the individual, detaching him from
lieu and leaning too often to melodrama or farce. Lady
ry has comic verve and inexhaustible invention, but to the
repertoire her exuberant and uncritical talent added
g save *The Image* (1910) to surpass her early *Spreading*
ws and *The Rising of the Moon*. Her real work lay in the
istration of the theatre through stormy days. The notable
mers before 1923 were Lord Dunsany, T. C. Murray and
x Robinson. Dunsany's highly personal talent ranges from
rotesque horror of *A Night at the Inn* and the *Queen's*
ies to the imaginative conception of *The Gods of the Moun-*
nd *The Tents of the Arabs*. He has singular inventiveness,
l felicity and at his weakest can construct a charming fable.
Murray's seven plays, of which *Birthright* (1910), *Maurice*
(1912) and *Autumn Fire* (1924) are the chief, show a
sense of dramatic situation with a capacity for easy, beau-
rose. Lennox Robinson, *Harvest* (1910) *The Whiteheaded*
1916), *The Lost Leader* (1918), possesses a less acute sense
matic construction, but has an unusual talent for inventing
sting character.

period under review closes in Dec. 1925 with the coming
of the Abbey Theatre. In its 21 years the Abbey has pro-
l 216 plays, the work of 86 authors, of whom 72 are Irish
mporaries. This record does not include the entire Irish
atic output, since certain secessions from the Abbey and
ish-speaking Drama League have produced interesting
s. That the vital impulse which was born in 1902 of the
ion of the writers Russell and Yeats with the players W. G.
rank Fay is not yet exhausted is proved by the advent in
of Sean O'Casey, the most powerful talent that has come
e Irish theatre since Synge. His plays *The Shadow of a*
an (1923), *Juno and the Paycock* (1924), *The Plough and*
tars (1926), measure the change of 25 years. The heroic
in verse or prose has given place to the drama of realism,
lain to the gunman. Casey has a consummate power of
ing and energising character, a speech that holds rich local
r without losing rhythm, pity and humour that transcend
qualor of the slums. In these gifts and in his passion for
, the fruit of enthusiasm and disillusion, lies his promise.

BLIOGRAPHY.—As a brilliant and scandalous chronicle of the
d George Moore's *Ave, Salve, Vale* (1911-4) is indispensable;
Gregory, *Our Irish Theatre* (1914) Æ *Imaginations and*
ies (1915); Thomas MacDonagh, *Literature in Ireland* (1916);
. Boyd, *Ireland's Literary Renaissance* (1916); *id.*, *The Con-*
rary Drama of Ireland (1918); Padraic Colum, *Anthology of*
Verse (1922); W. B. Yeats, *Plays and Controversies* (1923);
ox Robinson, *Golden Treasury of Irish Verse* (1925).

(C. P. C.)

ISH LITERATURE: GAELIC (*see* 5.622).—The decade
ving 1910 was a period of much activity in the publication of literature written in the Irish language. This activity took two forms, one the editing of older texts which had never seen the light before, and the other the creation of wholly new works. The Irish Texts Society in London, the learned magazine *Eriu* published in Dublin, the *Zeitschrift für celtische Philologie* published at Halle, the *Revue Celtique* of Paris and the *Celtic Review* of Edinburgh (which ceased publication after 1915) were the principal media for the publication of the older texts. The Irish Texts Society, in particular, published a number of handsome volumes, all *editiones principes* of important works. The veteran Dr. Whitley Stokes died in 1909. His last work, the Irish version of Lucan's Pharsalia, was published posthumously at Leipzig. Kuno Meyer died in 1919. The great native scholar Standish Hayes O'Grady had passed away in 1915.

The Gaelic Journal, which had been founded in 1882, came to an end in 1906 with the 197th number, and the want of a scholarly magazine dealing with the phases and difficulties of the more modern language was keenly felt. In 1912 T. O'Rahilly, later professor of Irish in Trinity College, Dublin, started a magazine *Gadelica*, to which he himself was the chief contributor, which reproduced all the best and most scholarly features of the old *Gaelic Journal*. Unfortunately this magazine came to an end in 1913. *Editiones principes* of valuable Irish texts published by various scholars are Manus O'Donnell's *Life of Columille* (Chicago, 1918), the first part of O'Clery's recension of the *Book of the Conquests of Ireland* (1916), *The Maguires of Fermanagh*, *The Flight of the Earls*, *The Book of the MacSweeneys*, *The Son of the Eagle*, Sean O'Neachtain's *Adventures of Edmund O'Clery*, the poems of *Pádraigin Hackett*, and others.

Perhaps amongst modern writers the name of Canon Peter O'Leary, parish priest of Castlelyons, must be mentioned above all others. Although he began to write late in life, after the rise of the Gaelic League, he produced an amazing number of excellent works, of which his first book, *Séadna* (1898) is nearly sure to live. His great merit is that he was the first to turn his back resolutely upon everything that was bookish and old and obscure, and to go for his mode of expressing himself to the folk speech of his native county of Cork. How suitable the speech of the people became in his hands to express the whole gamut of the emotions was to many a revelation. He died in 1920 and has left his trace upon the language more deeply than any other writer of his time. Father O'Leary stands for the most representative writer of the southern half of Ireland. The elder Pádraig O'Conaire (or Conry) would probably be regarded by many in 1925 as the best living writer of the northern half.

Irish literature got a great set-back during the political troubles following the rebellion of 1916. Two monthly magazines which published stories and folk-lore were burnt, one in Munster and one in Connacht (Connaught). The Connacht editor was "on the run" in the mountains, and of the joint editors of the southern paper one was "interned" and the other had his house burnt, with all the MSS. which he had spent half a lifetime collecting, and all the songs and music he had taken down from old people, now for the most part dead. Pádraig O'Conaire, too, had his little hut in the Dublin mountains burnt and several plays destroyed. (D. Hy.)

IRON AND STEEL (*see* 14.801).—Developments during 1910-26 in iron and steel were improvements in processes and equipment rather than new methods. An increase in the *per capita* consumption, far greater than the remarkable increase of the preceding decade, forced attention to means of securing maximum outputs as well as to the ever-present effort to secure economies. Larger units of manufacture were generally favoured and so-called "duplexing" and "triplexing" were outstanding features in steel-making. The latter part of the decade was marked also by a marvellous growth in popularity of the electric furnace, until at the end of 1922 there were 1,175 such furnaces in the world for steel-making alone, against 114 in 1910. The World War gave an artificial stimulus in general to plant expansion to meet the demands for ships and shells and resulted in a realignment of national capacity. In the main the following analysis is devoted to the economic side of the evolution of the period.

Iron Blast Furnace Construction.—Design was influenced by local experience of experts in the different iron-producing districts. Profiles depend on raw materials—quality of coke, nature and concentration of ores. Generally speaking, tendency toward greater bosh and shaft angles continued (bosh angle 75° to 80°; shaft angle 84° to 86°). The size of stack increased only in the districts treating low-grade ore, while with high-grade ore (50% to 62% iron) the 500- to 600-ton-per-day size became the standard and many old furnaces were enlarged. In the Minette district of Europe, where the ore charged contained between 30% and 35% iron, the 200- to 250-ton unit became popular in all new construction. The cubical capacity of a blast furnace ranged between 40 and 100 cu. ft. per ton of pig-iron blown in 24 hours.

Individual parts of blast furnaces received particular attention. The hearth construction became reinforced and often cooled to avoid breakouts of the molten metal, and greater attention was given to brickwork to limit the downward destructive action of the metal. Emergency tuyeres at mid-height of the bosh—standard in the Minette district—lost their popularity and disappeared in nearly all new furnaces. For the handling of the material—ore, limestone and coke—mechanical devices won increased favour owing to the enormous masses involved and to the growing scarcity of labour. In America, the simple skip hoist was almost universally adopted in new plants, while in Europe the drop-bottom bucket hoist became popular and its design was ingeniously varied. It is noteworthy that the drop-bottom bucket, which was originated in America (Duquesne works) and was perfected in Germany during the years 1905–10, was little used in the United States ten years later.

It had been supplanted by the cup-and-cone top with a rotary distributor (McKee); in Europe the double cup-and-cone construction, giving low drop height and assuring less breakage of the softer coke, was preferred. These two solutions were more or less linked to the hoist system adopted. The furnace interiors were bricked up, in America of standard-shaped refractories giving a multitude of joints, while it was customary all over Europe to use special large-volume brick, shaped to reduce the joints. Both systems seemed to give satisfaction to the operators, and comparisons were not possible owing to the difference in the operating conditions. Speaking generally, the American design with a plate lining involved less steel for construction, while the Luxembourg-Lorraine type of blast furnace was conservative and substantial.

Blast Furnace Operation.—General progress was marked; greater familiarity with the chemical problems and increased mechanical equipment made operation more easily controllable, results more positive and disturbances less frequent. The use of excessively fine ore was accompanied by a high-solution loss of coke, and agglomerating of ore was recognised as desirable. This led to increasing attention to sintering fine ore mixed with flue-dust, and recharging of dust without treatment seemed likely to die out. Higher temperature of the air blast was a noteworthy development, as each increase of 200° F. has been reflected by 4% to 5% reduction in coke consumption. In the Minette district 850° to 900° F. blast temperatures were quite common. The blast pressure, which remained without much change, varied according to districts and the forcing of the operation from 4 to 15 lb. per sq. inch. In case of a relatively cold spell within the furnace due to overfluxing, bad coke or dropping of a hanging, the introduction of kerosene (paraffin) through the tuyeres proved a quick remedy, although it necessarily required care and progressive application to avoid accidents. The use of this cure rendered superfluous the auxiliary tuyeres at mid-height of bosh. The use of the oxygen torch to burn out the iron notch in case of metallic incrustations, extremely difficult to remove, proved a great help to the working crews. Mechanical appliances in cast-houses were installed in increasing numbers to supplant hand work, especially in sand casting floors. Cranes equipped with lifting magnets and pneumatic hammers elastically suspended proved a step toward the best method of moulding, breaking and handling of sand-cast pig-iron. Fo qualities of pig-iron the continuous casting machines conti to be the accepted standard. In plants adjoining steel-w transport ladles of larger size (30 to 50 tons) and designs assu better insulation and easier skimming of slag were evolved.

Blast Furnace Gas.—Continuously increasing price of coal coke affected the economies of the blast-furnace gas and m it a by-product of great importance. The fuel value of original waste became more and more recognised in Ame The first effort, to avoid all gas losses so far as possible, led to installation of double furnace tops, which became universal. N gas-cleaning processes were developed to remove dust impur from the by-product fuel, thus increasing its adaptability combustion and securing greater efficiencies in its utilisat To facilitate operation and render supervision automa pressure-regulating devices were evolved and accumulators w installed to equalise supply and provide steady outflow. (cleaning attracted the attention of operators in Europ countries greatly in need of fuel, because the calorific valu the gas counterbalanced the cost of purification. In Amer the coal shortage, due to inordinate demand and dislocatio railway service, produced the same result. The first step in cleaning was the installation of a dust collector close to the takes and the downcomers of each blast furnace. In it the co dust was deposited by a slowing-down of the gas flow an sudden change in its direction. This apparatus was independ of all further cleaning methods.

To separate the fine dust particles two different processes w applied: (1) wet method; (2) dry filtration.

(1) By the wet method the gases were cooled by injection water, and the dust particles, passing through the fog artifici produced, were arrested by scrubbers. Experience led to a subd sion of the operations, called medium cleaning and fine clea with apparatus protected by patents. The sludge of dust and wa was removed by the application of centrifugal force, separating and liquid in specially designed fans or washers (Theissen, Brass etc.). The disposal of the water created a problem, as contaminat of rivers is against the law in most industrial countries. In dep ponds the settling of the impurities was incomplete and its remov tedious manual operation; and the Dorr thickener, developed in c concentration districts, was adopted, as assuring continuous se automatically by means of a special mud pump requiring little att tion. A drawback of wet systems was that the sensible heat of blast furnace gas was absorbed by the cleaning water and lost yond recovery. On the other hand, it permitted the installation smaller gas-piping and dispensed with the insulation of the li against heat loss, thus saving appreciable capital outlay in the cas long-distance distribution. Another drawback of the wet method w that recovery of the dust required driving off the water from t heavy mud in any briquetting or concentrating process attempt

(2) The dry methods of gas-cleaning had their advocates wh every little economy was watched, such as retaining the sensible he of the gas and saving the expense of water-handling in keeping t dust dry. To separate the dust out of the hot gases, filtration a peared to be the best process. With mechanical filtration, fin woven cloth or asbestos-fabric bags or slag-wool layers let the g pass at low velocity but retained the solid dust, which was remov periodically by return currents of clean gas. The principle was adopt in the Beth-Halberg system in Europe and the Kling-Weidle apparatus in the United States.

The chief ways in which blast-furnace gases were utilised we as follows:—

(*a*) *Cowper or Hot-blast Stoves.*—The absence of dust in the g provided for rational stove design, as the complicating side issues clogged-up passes and slagged-up checker holes disappeared, as w as the periodic waste of cooling, cleaning and warming-up of ea unit. The clean gas meant a reduction of the area of heating surfac and brick volume expressed by fewer stoves per blast furnace—thr to four per furnace against four to five 10 years earlier. Then bega a systematic study of the heat-transmission phenomena within t mass of checker work.

(*b*) *Boilers.*—Clean blast-furnace gas allowed for advantageo use in connection with steam boilers; first, through more efficie combustion, in effect less gas per pound of steam produced; secon higher ratings of boilers, in effect more steam per unit of boil evaporating surface or fewer boilers for a given plant capacity; an third, quick adaptation to any load required, in effect flexibility ease of operation. Many efficient burners were invented and son were installed on a large scale.

(*c*) *Metallurgical Furnaces.*—The removal of flue-dust mad possible a wider distribution of the blast-furnace gas, and in Europ use was made of the surplus gas with success in all kinds of furnace

calorific value coupled with the small amount of air required
plete combustion, opened fields where so-called mellow heat-
ies are demanded, such as core drying, mould drying, anneal-
sting and ore concentrating.

as Engines.—The principle that clean gas was indispensable
rnal-combustion engines was long recognised, but its practical
tion did not occur until after 1910. Also a cool gas was re-
as essential to secure adequate volumetric efficiency of each
Among gas engines, the four-cycle type outranked con-
ly the two-cycle type. Devices for close regulation were
ed on the principle of qualitative-quantitative mixture.
ilt-up cylinder seemed to win greater favour than the one-
sting. The safety of operation reached a parity with that of
ngines or turbines, the gas being clean. The exhaust heat
engines, representing some 40 % of the energy, was utilised
rate steam, and 70 % was thus recovered in some instances.
the various uses made of the gaseous by-products of the blast
only the heating of the hot-blast stoves was universally
All experts agreed that 30 % to 40 % of the gases are best
ed for that purpose. The surplus of 60 % to 65 % was utilised
other purposes already mentioned. In the utilisation to pro-
ast pressure and to develop power, the battle for suprem-
ween the gas-engine using blast-furnace gas and the steam
sing the gas to supply energy to engine or turbine remained
led. Thermal efficiencies were not the only issues at stake.
ope, the gas-engine had the firmer standing, while in America
ler seemed to be the more in favour. Even for generating the
ressures, the competition between gas-engine-driven air com-
s, steam-engine blowing engines and turbo-blowers had gone
out absolutely proving the superiority of any one combina-
Varying economic conditions in each country and different
onsiderations, as well as the purely technical aspects of the
n, were deciding factors. Europe, with its skilled workmen
ore stabilised market conditions, presented a background
t from that of America with its fluid trade conditions and its
ed unskilled labour.

Layout and Size.—A single blast furnace, built alone on a
matter how well chosen, proved not to be a logical industrial
ise. The number of such plants existing was the result of
ition, of fluctuating market conditions, and constituted an
ic waste, speaking generally. With combined units the ac-
equipment became cheaper in installation cost and in terms
output and more efficient in operation, through flexibility
surance against breakdown. Three to six furnaces grouped
l-laid-out plants were established as an economic whole.
id the loss of the sensible heat of the molten pig-iron and to
the metal without cooling, steel-works were logically joined
t-furnace plants. The two separate departments were thus
ed in one industrial unit, with the added advantage that the
of power available at the furnaces could be absorbed in the
mills.

ric Pig-Iron Furnaces.—Tests made at Trollhättan, Sweden,
onclusive only for high-grade pig-iron similar to the Swedish
al pig-iron. Since 1918, the Domnarfvet works in Sweden had
ed several shaft-type furnaces (with gas circulation using
62 % of iron ore and charcoal as a reducing agent). Mixtures
coal and coke up to 50 % coke were found satisfactory. Per
pig-iron produced, 3,400 lb. of ore (containing 61·5 % Fe),
of lime and 740 lb. of charcoal were charged; 15,000 cu. ft.
at 240 B.T.U. per cu. ft. were captured at the top; 2,150
tt-hours was the electric energy consumption per 2,000 lb.
iron. The problem of using electric current for supplying heat
blast furnace reactions had particular interest for the eastern
es in France, British Columbia, Brazil, Italy, as well as
n and Norway, where fuel is scarce and low-priced electricity
be made available.

Steel Plant.—The usefulness of mixers as an important adjunct
steel-making plant was universally recognised, as numerous
ations attest. Their field was established in equalising quali-
ly the successive outgivings of the blast furnaces and in de-
rising the molten metal. To accelerate the removal of sul-
less than 0·5 % of manganese proved most helpful. The shape
mixer that gave best results was the simple cylinder rotating
axis. The most popular size proved to be 1,000 to 1,400 tons'
ning capacity. Simple oil or gas burners without regenerating
er in the United States, with pre-heating checkers sometimes
rope, completed the equipment. In Germany, a 2,000-ton-
ty mixer was reported built, but only after considerable dis-
n as to its size. The mixer was, of course, brought into being
eiving metal from the blast furnace and delivering to the ladle
nsport to the steel plant as needed. Slag that floats on the top
bath must be skimmed off from time to time.

verter Plants.—No noteworthy development took place in
id-operating (Bessemer) converter or in the basic-operating
as) converter for making steel. The 20- to 25-ton-capacity
remained nearly universal. A 40-ton size was proposed in
y a Belgian engineer. As between Europe and the United
, the hydraulic tilting mechanism of the former did not give
the electric drive of the latter, nor did the gas-engine blowing
succumb to the turbo-blowers of American practice.

Open-hearth Plants.—Without radical change in type, sizes of open-hearth furnaces increased up to and above 100 tons' capacity, but the tendency was toward fully controllable sizes. The practice in the United States settled to 80 to 100 tons and in Europe 40 to 50 tons. Volumes of checker chamber increased to get better so-called flywheel effect. Greater attention was paid to port and head construction to lengthen life, and to a reinforced roof. Reversing valves were marketed for reducing flow resistance and waste of gas. Waste heat boilers were more generally installed, but not universally adopted because of their interference with concentration and general electrification of plants. Marked superiority or inferiority was not shown for the tilting construction of furnace when tested by use beside the stationary type. Natural gas disappearing in America, producer gas was the more generally adopted fuel. Powdered coal was tried with some success but without proved superiority; one difficulty was that checker chambers got clogged by ashdust. By-product tar and crude oil proved fuels well suited for the purpose if available at low price and in large quantities.

Electric Steel Furnaces.—The electric steel furnace for refining and melting iron and steel developed to a surprising extent in the decade 1910–20 in size and in number of installations. It proved ideally suited for quality products and high-grade materials, because no complication through fuel medium exists and because atmosphere and temperature are attainable practically at will. From 500-lb. capacity, single furnaces were built to 40 tons, with most of them of 5- to 8-ton capacities. (For electric furnace statistics, see *Iron Age*, Jan. 1 1921.) Of the 960 known electric steel furnaces in existence in Jan. 1921, 356 were in the United States, 150 in England, 100 in Germany, 60 in France and 43 in Canada. Of the total, 308 were Héroult arc furnaces, 102 Rennerfelt induction furnaces and 90 Greaves-Etchells furnaces. The electric furnace was adopted for making metal mixtures, ferro-alloys, special steels of high quality in large amounts—strict repetition being possible in an absolute positive way. A disadvantage was that the metal is not at rest but always in motion, through electric or magnetic influences. Though agitation was often desirable, the action hampered the separation of the slag and the rising of impurities out of the molten mass. A remedy for this was repeated skimming of slag and careful supervision. One unusual utilisation of the electric furnace was the making of pig-iron out of scrap, especially in the United States, to supply deficiencies in the amount of low-phosphorus pig-iron, particularly in the manufacture of ordnance. It amounted to a synthetic reconversion of steel into pig-iron. Fine coke was added to the slagged refined scrap for carburisation, and the method promised to be commercially feasible in regions having electric power but little local fuel available and situated so that delivered pig-iron was high in price. For deoxidation in the refining process and for recarburisation, ferromanganese and spiegeleisen retained their popularity in spite of high prices under erratic market conditions. In Europe pre-heating, often pre-melting, of the addition was the current practice, to save in the amount needed and to accelerate effects. In America the wasteful method of cold additions prevailed. Ferrotitanium, with carbon or carbon-free, was used, as well as ferrosilicon and aluminium in small quantities. Some steel plants made additions in the ladle, others finished the operation in the furnace.

Steel-making Operations.—The outstanding feature of steel-making operations was the recognition of splitting the refining process into two phases, or the two-slag method, to increase production and to lower production costs. The efforts of Bertrand-Thiel and Talbot recognised in effect this principle; and duplexing and triplexing were only operating variations of the same principle, to remove the impurities of the pig-iron stepwise in the furnaces best suited for each purpose. Thus sulphur and manganese pass out in the mixer; silicon and part of the carbon in the converter; the rest of the carbon and phosphorus in the open-hearth furnace; additions were made and alloys were added in the electric furnace. The plant necessitated considerable equipment, but it secured ease of operations, exact control of results and made possible quantity production. Below 1,600 tons per 24 hours, savings in operation were regarded as hardly possible, as in slack market periods overhead expense was too large. During the World War about 10 duplexing plants, refining in an acid converter and finishing in basic open-hearth furnaces, were built in the United States under the pressure created by an ammunition famine. Electric duplexing plants (meaning melting and preparing in open-hearth furnaces and finishing in electric furnaces) were built in large numbers, offering a special-quality product on a large scale. A number of new independent efforts were made to produce steel direct from the ore without the interpolation of the iron blast furnace, but none could be said to have been proved feasible on a scale beyond that of the laboratory.

The Shaping of Steel.—Rolling-mills (used if the demand for a product is large and if its shape lends itself to a continuous process, like rails, angles, plates, bars, etc.) and the forge-shop (if the shapes to be produced are complicated, short in length, unsuited for the rolling-mill), both change the shape of the metal heated at high temperature, about 2,000° to 2,300° Fahrenheit. Both require finishing departments to straighten, shear or bundle the rolled product or to clean off the fins, rough off the unevenness of the forging operations, and they may need annealing and pickling facilities to improve the quality of the product. A special process of milling the top and bottom of rail blooms, to remove cracks and roughness from the semi-finished steel and also surfaces decarbonised in the heating furnaces, was put into use at the Lackawanna mills in America and resulted in a reduction in the number of finished rails classed as seconds.

In the period 1908–26 the development of the rolling-mill was influenced, first, by the great manufacturing principles of concentration and specialisation, and, second, by the electrification of the motive power. Concentration demanded large production in one unit and suitable equipment to attain that aim; in other words, mechanical devices in preference to hand operation. Specialisation was applied to the shape to be rolled as well as to the mill used for production. Standardisation of rails, beams and angles, the reduction of the number of profiles, and the simplification of shapes were consequences, as well as the installation of mills for specific purposes. The application of these rational principles was accelerated by the use of the electric motor. The advantages were recognised about 1905, but the next 15 years brought their practical realisation. The numerous little steam-engines disappeared and the electric motor revolutionised the handling of the material by cranes and overhead trolleys as well as the mill accessories, like tables, skids, transfers, etc. The first step was the creation of central power plants where electricity was generated either in turbine or gas-engine generators, preferably with the help of the surplus gas from the blast furnace. Many steel plants in 1920 were equipped with 20,000- to 40,000-K.W. power stations. The second step was the development of speed reducing devices made necessary by the high speed of electric motors. The advance of the gear-cutting industry and the advent of spiral-type teeth, single or herring-bone, and the development of new types of teeth giving less wear, more rolling surface, and, later, the use of special hardened, heat-treated steels were eagerly taken up by the designers of mill machinery to increase the quality of their product. Reduction gears transmitting up to 5,000 H.P. came into daily use, and the ratio of 10 or 12 to 1 in one reduction gave satisfactory service. The third step was the development of speed-regulating devices, especially in connection with alternating-current motors, to secure efficient operation for variable conditions. The fourth step was the solving of the load problem of large, intermittently operating motors, reversing their direction of rotation by means of the motor-flywheel set advocated by the Austrian engineer Ilgner in connection with suitable controllers of which the Ward-Leonard system was the prototype. Much work and inventive genius were concentrated on these difficulties to bring about in less than 15 years the high efficiency and great safety of operation by electricity of steel mills. The development of the rolling mills is still progressing.

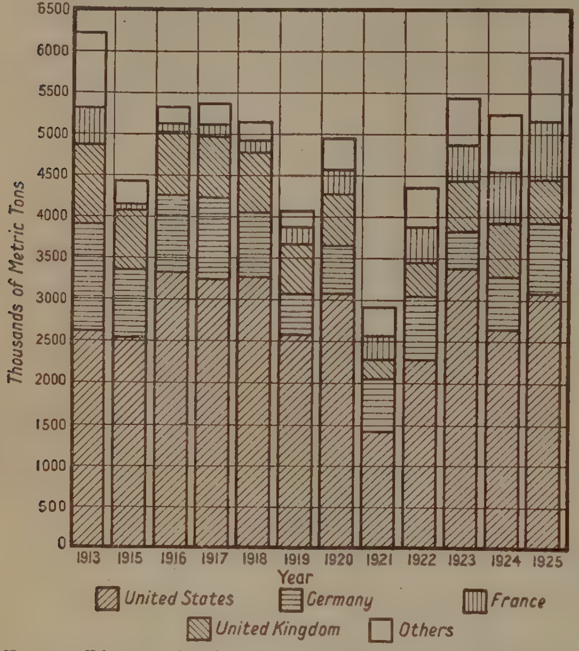

FIG. 1.—Diagram showing the production of Pig-iron in the principal producing countries, for 1913 and 1915–25 (monthly average). *Note:* "Others" include Luxembourg, Belgium, the Saar, Sweden, Canada, Poland and the Union of Socialist Soviet Republics.

For driving continuous mills electricity was preferred to the steam-engine. The uniflow steam-engine found favour up to 3,000-H.P. units, but installations were few. Where the effort was to bring about a complete electrification of the plant, steam-engines proved unpopular, possible economy being counterbalanced by complication of maintenance and other administrative considerations. For the reversing drive of large units, requiring loads up to 20,00
25,000 H.P., the electrical drive was not necessarily in the as
ancy. The high initial cost of the motor generator flywheel
with direct-current motor directly connected to pinion and mill
made the chief argument against universal adoption of electri
and numbers of old plants were reluctant to change their some
obsolete steam equipment. In America only a few engines as
as 25,000 to 30,000 H.P. (Weirton and Lukens) were installe
new work, and in England large vertical engines were built.
electrical units, however, increased considerably in number and
and considerable progress was realised in the matter of manoeuv
capacity, in standardisation of winding and accessories, in recor
output and efficiency of running. In 1925 the electrical industr
aggressively working on betterments, while the partisans o
steam-engine rested on past laurels. Parity existed on all p
except first cost of installation. Even for smaller mills of the re
ing type electrical drives were built, such as 24-in. mill (M
Indiana Harbor), 26-in. mill (Atlanta, Ga.). Two-high rever
plate-mills also disputed the field with the three-high type in th
dium-sized equipment, and latest universal-mill installations we
the reversing type electrically driven. The largest mill for plate
in. wide, at Lukens, Pa., which was completed in 1918, was of spe
design, reversing and steam-driven. (*Iron Age*, Jan. 2 1919.)

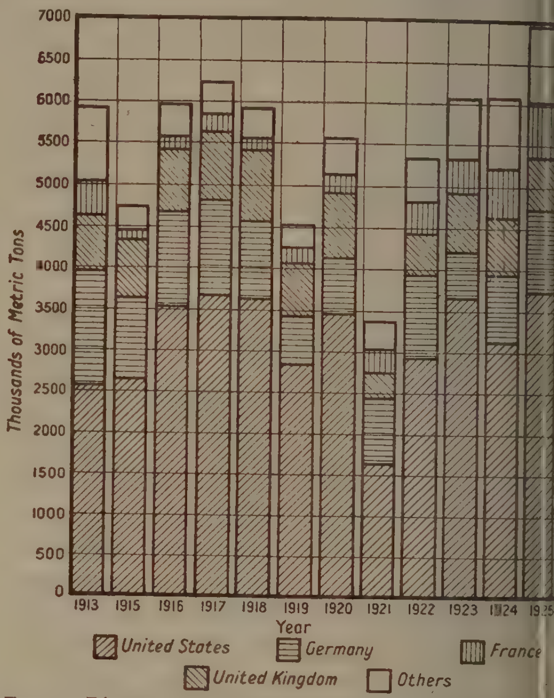

FIG. 2.—Diagram showing the production of Crude Steel in
principal producing countries, for 1913 and 1915–25 (mont
average). *Note:* "Others" include Luxembourg, Belgium
Saar, Sweden, Canada, Poland, Italy and the Union of Soci
Soviet Republics.

The concentration of production in large well-balanced pla
with adequate resources and sales organisation permitted a log
subdivision of the rolling-mill programme with a subsequent red
tion of production cost. The smallest bloom section, 6x6 in., ha
tendency to grow toward 8x8 in., as some experts claimed that
sq. in. was the economic limit of the range of a large mill. To red
the time required for roll changing, complete spare housings, co
pletely mounted, came to be good mill practice, these being drop
on the shoeplates by the cranes. In some specialty plants someti
two or three housings were changed together.

Furnaces.—The development of soaking, reheating and anneal
furnaces was influenced by the increasing price of fuel and consid
able efforts were made to boost heating efficiencies. In Europe g
firing with recuperation and regeneration of waste heat was
favourite, especially because producer-gas firing was much used a
remarkable results achieved. In America continuing shortage
natural gas for industrial purposes in regions such as the Pittsbu
district made a substitute market for crude oils, coke-oven gas a
powdered coal. Especially since 1915, the use of powdered c
developed to a surprising degree for all kinds of metal-heating app
cations. Mechanical stokers were evolved in numerous designs
dispense with hand labour and to control by mechanical contrivan
the combustion of coal in an efficient way.

ill Equipment.—Roller tables, skids, transfers, cooling-beds and ·s were perfected and installed in increasing numbers owing ly to the efficiency and handiness of electric motors. Variable- ·l drives gained in favour. Straighteners, saws, punches and ·s were made in conformity with the availability of electric ·r. Hydraulic devices were pushed in the background and elec- lrives supplanted engines in the field of these mill accessories.

etallographic Progress.—Metallographic knowledge spread ·he period 1910–25 from the university laboratory to the mill, outgrowing the narrow circle of students to become helpmate of the operator. Pyrometers or temperature re- ers and the scientific control of temperature came as a matter ourse in numbers of steel mills. The variety of alloy steels ·ed for practical uses was due to the theoretical investigations he metallograph. Chromium and vanadium, nickel and lt, tungsten and molybdenum added their special properties teel, and improved heat-treating methods enhanced these ities with a skill and positiveness hitherto unknown.

eyond the realm of iron and steel making, properly regarded, coming within the purview of the industry, the remarkable ·lopment of the period was the heat treatment of metals. ·ent hand-in-hand with the study (by means of the micro- ·e, and thus of the photomicrograph) of grain structure and transformations which take place in the so-called solid solu- s, according to the degree of heating and cooling given to the al. Practical applications of the investigations of the scientist numerous, and the history of the temperature experience given metal product going into an article of commerce was ·pted as equally important with the chemical constituents, two pieces of steel, identical chemically, may be made to ave physically very differently according to their crystalline e. (*See* METALLOGRAPHY.)

ther developments which must be briefly enumerated were: ·rts to test a material's fitness or agreement to specifications with- destroying it, as by X-ray photographs (sheets), or by magnetic analysis (by noting changes in permeability of an article of constant cross-section, as a rifle-barrel, wire or steel rail, by moving it through a magnetic field); these, however, were not definitely of commercial dependence, pending further investigation; success in making large chains of cast-steel links followed by heat treatment, such as annealing; efforts to cast in centrifugal moulds, such as cast-iron pipe by introducing molten iron into the rotating mould; commercial recovery of potash from blast-furnace flue-dust deposits at the base of hot stoves; making iron pipe by an electrolytic process of depositing iron on a rotating cathode in a ferrous-chloride electrolyte; commercial manufacture of a stainless steel having 10% to 15% of chromium, which, Harry Brearley in England discovered, gave amazing resistance to corrosion, so that it became the base of an important cutlery industry and offered a satisfactory material for rifle-barrels, turbine blades and steel articles subject to both erosion and corrosion; additions to the numberless varieties of alloy steels, largely to secure some desired physical characteristic for specific needs, such as increased tensile strength in terms of lighter members of a fabricated steel product; elements like cerium and zirconium entered the ferro-alloy circle, but a delineation of the various alloys and of their definite fields of usefulness was not completed.

Production.—The accompanying table shows the relative producing capacity of the leading industrial nations of the world. The figures are of actual production as well as capacity to produce. The world's steel-making capacity was put, in 1926, at 116,000,000 tons in round numbers. One-half was credited to the United States, which could make more than four times as much as Great Britain and more than three times as much as Germany. The United States' percentage of the world's pig-iron-making facilities was somewhat over 46%. More than one-third of the total annual output of iron ore in the world came from the United States, and of the American production 85% came from the Lake Superior district. The Lorraine ore-fields supplied about 25% of the world needs, 80% of its output going to France and Germany.

World statistics of the production of ore, pig-iron, and crude and finished forms of steel are obtainable from the National Federation of Iron and Steel Manufacturers, London.

igures in tons: gross, for England, United States, etc.; metric, for France, Germany, etc.

Includes both Luxembourg and Alsace-Lorraine; 1913 pig-iron production of Luxembourg (2,547,861 tons) and of Alsace-Lorraine 364,000 tons), deducted from the reported figure, leaves 12,897,311 tons for Germany. Similarly, for steel, deducting the 1,336,263 tons uxembourg and 2,286,354 tons of Alsace-Lorraine, leaves 15,312,472 tons for Germany.

Austria-Hungary in 1916 produced 2,380,000 tons of pig-iron and 3,278,000 tons of steel,

Includes production of Poland.

One plant only.

IRRIGATION ENGINEERING (*see* 14.841).—During the present century development has continued at an accelerated pace; one of the many causes was and is the desire to meet the world's demand for cotton, particularly the more valuable long staple varieties.

Barrages and Dams.—Where areas to be served were large enough, barrages have been built; where rivers have a very irregular discharge, dams have been erected to impound water from the flood seasons to augment the supply in drier periods. From the barrages or dams high-level gravitation canals lead the water to the soil. Where the barrage system is not possible, modern water-lifting appliances serve new lands, or in many cases replace in areas already cultivated both the hand-worked water-lifting appliance known in Egypt as the *shadoof* and the cattle-driven water-wheel. Irrigation is thus serving an ever increasing area throughout the world in regions where suitable soil, climate and plain exist in combination.

Distribution.—With these extensions, in places approaching the limits imposed by the volume of water available, the problem of equal distribution becomes important. This, in turn, depends on an accurate estimation of the volume. Measurements were formerly made by means of data obtained from noting the speed of objects floating with the stream at various depths. In the last 30 years, current meters replaced floats and give more regular results, but it was not definitely known whether these results indicated actual volumes.

Measurements.—This doubt has now been settled through the full-scale measurements made since 1905 at Aswan by which the Nile discharge has been calibrated to within an error of 1% of the actual volume passing during all but the very highest levels, and it is hoped in time these will be measured also. Current meter discharges taken simultaneously with the measurement at the dam, repeated a few times and the mean taken, gave very similar results and thus proved the accuracy of current meters. The data obtained from small scale models can be depended upon to within a small percentage of error.

Work in Egypt

The cultivable area to-day in Southern or Upper Egypt, from Aswan to Cairo, is about 2,500,000 ac. of which 2,200,000 were cultivated in 1910, 1,000,000 ac. being under the perennial form of irrigation and 1,200,000 ac. under the older basin system. In the Delta there were about 3,000,000 ac. cultivated, all under the perennial system, out of a total cultivable area of about 4,800,000 acres.

The area of all Egypt is, however, over 500,000,000 acres. Thus only about 7,300,000 ac. of this vast extent can be cultivated from the waters of the Nile. All the remainder must continue in its present inhospitable state unless a climatic change occurs.

In 1902 the completion of the original and low level Aswan dam permitted 1,000,000,000 tons of water to be stored annually from the season of excess waters in the river, to be released again in the following spring and summer. In the few years following 1902 the need for an immediate increase in the volume of water available summer irrigation became pressing if the area then cultivated to be annually assured of an adequate supply in really low yea and if some new areas not hitherto cultivated were to receive wa at all times. The work of storing more water at Aswan by heigh ing and thickening the original masonry dam and increasing capacity to 2,400,000,000 tons, was completed in 1912. The need existing areas for all the water available was accentuated by phenomenally low flood of 1913, which was followed as a natu consequence by a poor spring and summer supply in 1914.

The 1913 flood was estimated to be the lowest for 150 years a except for the existence of the various barrages and the dam acr the river, would have spelt famine as well as financial disaster to t country. The 1914 river, even when increased by the whole of t stored water from Aswan, was only just sufficient to ensure the safe of the cotton crop of that year. Additional supplies of summer wa are needed for some of the still uncultivated areas in the delta, a the conversion of further areas in Upper Egypt from basin perennial irrigation can only be satisfied by still greater control the Nile.

The construction of a dam on the White Nile near Khartou now being taken in hand, forming another, though not the fin stage in the provision of water for Egypt. The very least quantity water storable each autumn by the new dam will be greater th that now annually held up by the Aswan dam, and like it, the wa can be used in the following spring and summer in Egypt. With minimum of 3,000,000,000 tons thus provided, an additional 1,00 000 ac. of Egypt's waste lands may be given summer water.

Further Developments.—Further works must, however, undertaken in the Sudd region of the Sudan and even beyo it, before the final stage of an Egypt cultivated to its capacit with an adequate supply of water to meet all her requirement is reached. These works will most probably consist of traini the waters through the Sudd region to prevent waste and erecting of a dam at Lake Albert.

The Sudd region lies on the White Nile and commences abo 500 m. south of Khartoum and is in reality a vast plain throu which the White Nile meanders for 250 m. with its water eith at or just above ground level. As a consequence the whole forn a great reedy marsh interspersed with open lagoons; into it flo the flood season waters of the White Nile; they evaporate then selves away to such an extent that no great variation of volun is normally experienced at its outlet. The lost waters could great measure, be stored in Lake Albert and let out in such manner as best to suit the requirements of Egypt. Conservatio from evaporation when passing through the Sudd region can secured by confining the flow to a definite channel. The increase acreage which it will then be possible to cultivate in Egypt wi bring the total area up to its maximum of about 7,300,000 acre

Developments in the Sudan

Previous to 1910, except for a few thousand acres served b pumps, all the crops grown in the Sudan along the main Nil from Wady Halfa to Khartoum and the White Nile from Khar toum to the Sudd region were sown on land naturally inundate on its low banks by the annual rise of the Nile. On the Blu Nile, rainfall alone was depended on to fertilise the crops grown

About 1909 one of the uncultivated areas below Khartoum wa turned into a perennial irrigation farm and was among the first t produce cotton in the Sudan, by means of water pumped from th Nile. Soon after that date the possibility of growing cotton in th Gezira, that huge tract which lies in the fork of the Blue and White Niles, became apparent. Here some 5,000,000 ac. form a gentl sloping plain stretching along between both rivers for about 200 m from Khartoum. From this point southward the plain is interspers with small isolated granitic hills which, as a line south-east is tra versed, increase in number and height. Of the 5,000,000 ac. plair probably 3,000,000 will form the maximum area cultivable. On the remaining 2,000,000 ac. near Khartoum the soil is said not to be so good, being of a more sandy nature.

Two experimental farms of a few hundred acres each were set down in the cultivable area and proved after a few years' trial the suitability of the soil for cotton growing. The summer climate, however, was found to be too trying, although below Khartoum and in Egypt cotton is entirely a summer crop. Cotton sown in mid-July in the Gezira and picked in the following spring gave a return on an average of 400 lb. per ac., a figure equal to the normal Egyptian production. This result was obtained at a season of the year when there is usually an abundance of water in the river.

The cotton plant in the Gezira is in the soil from mid-July, when it is sown, to final picking in April, or a period of about nine months.

ceptional circumstances a final watering may be required as
s April 15, though normally the last watering is expected to be
by March 31. Long before either of these dates Egypt, not-
tanding her great reservoir at Aswan, in low river years requires
at the Blue Nile can supply. It became necessary, therefore,
vise the best method of lifting water from the Blue Nile on to
ain and of storing a sufficient volume of it to meet the demands
Gezira in those months when Egypt requires all that flows in
ver. The decision arrived at was to build a combined dam
veir at a point 5 m. south of Sennar, where a narrow belt of
o rock, which scarcely rises above the level of the plain on
side, runs across the river.
construction of the combined dam and weir was proceeded
and completed in July 1925, at a cost of about £6,000,000, the
system bringing the total up to about £9,000,000. The dam
tore about 600,000,000 tons of water for use in the critical
which extends from Jan. to March and possibly to April,
Egypt requires all that passes down in a very low year. The
canal leading from the dam is some 60 km. long before reaching
oint where branch canals spread out from it on to the land to be
ted. The area judged sufficient to form a commercial proposi-
n view of the cost of the works was 300,000 acres. It is now
ed this area can be considerably increased without endangering
t's supply. Certainly if an amicable agreement can be arrived
tween the two countries, greater areas can be cultivated in the
a in all other years than the phenomenally low one on which
00,000 ac. scheme was based.

w Projects.—When still greater areas have to be brought
cultivation, and it is possible that 3,000,000 ac. may even-
y be cultivated in the Gezira, either new storage works
be built or such further control of the Nile be organised
ll permit Egypt to reduce her demands on the volume in
lue Nile. Special storage works for the Sudan can probably
est built by permission of Abyssinia. At the exit of Lake
a in that country at the source of the Blue Nile, by storage
e lake, the annual flood waters can be controlled and about
,000,000 tons of water conserved for use at a later period,
permitting a great increase in the area cultivable in the
a.
ere are possible alternatives, such as the building of a mini-
Aswan dam somewhere near Roseires. Here a regulation
e river will not be quite such a simple matter as at Lake
a, as the flood waters at Roseires are heavily laden with
These must be allowed to pass and water only be abstracted
subsequent but still high stage when little or no silt is still
nt, otherwise Egypt would be deprived of this valuable
rial. If collaboration with Egypt in works in the Sudan is
ted, then the White Nile dam will be made as large as is
stent with safety so as to store as much water as can be
ed from the flood waters.
hatever capacity be given to the White Nile dam Egypt
still provide herself with more water than even it can hold,
some regulation of the Sudd region must of necessity be one
e features of such a provision, coupled with a huge dam at
source of the White Nile and the mouth of Lake Albert.
des the Gezira Plain the Sudan has other irrigation areas
e great improvements have taken place, as at Tokar and
sala.

kar.—The river Barakat rises in the rainy season in the Abys-
n hills and rushes as a chocolate-coloured thick stream on to the
r Plain where it eventually spreads out into a thin film which is
ed up by the thirsty soil. The plain, however, is much greater
tent than the water can cover, although some finds its way to the
s recorded in 1921. Great anxiety is continually caused by the
lity of the flood to break away into areas not hitherto cultivated
ven if cultivated, so far from Tokar as to be inconvenient for
sport. In recent years designs were studied for the purpose of
cising some control over the direction of flow. These have been
ied out and have so far been successful. The total area served
es greatly from year to year. In 1921–2 about 55,000 ac. were
led, though not all were cultivated.
ssala.—The river Gash rises in the Abyssinian foothills and
mes of considerable volume in the flood season by the time it
hes Kassala. Here it spreads itself over the plain in such a
ner that none of its waters ever reach the Nile or its nearest
utary the Atbara. Some control has been exercised over the
to keep the water annually to definite areas.
a really good year with the supply of water at a maximum,
00 ac. of cotton might be cultivated. Owing to the poor flood
925 only 11,000 ac. have been sown.

Progress in India

Irrigation gives valuable aid in the fight against those periodic famines which always happened after rainfall failures, and it also causes an increase in production through its extension into new and suitable areas hitherto lying fallow. During 40 years, 1885–1925 in particular, developments have steadily progressed. 10,500,000 ac. were irrigated in 1878–9; 19,250,000 ac. at the beginning of the century, and 28,000,000 ac. in 1923–4. Additional works now under construction will add 2,500,000 acres. New schemes are contemplated which will add a further 4,750,000 acres. When completed they will bring the irrigated area of British India up to about 36,000,000 acres.

These figures exclude the water supplied from the Punjab canals to 650,000 ac. in the native states. The Sutlej Valley project, mainly for the benefit of the native states, will increase the total by a further 3,250,000 ac., making in the proximate future a grand total of about 40,000,000 ac. of irrigated land in all India.

Mileage of Channels.—In 1900–1, 39,142 m. of channels were in operation; by 1920–1 this had increased to 55,202 m. or an average addition of about 800 m. of channels per annum. The annual revenue return is between 7% to 8% on the capital invested in government irrigation works.

The following table shows the acreage of crops matured during 1923–4 by means of government irrigation systems compared with the total area under cultivation in the several provinces of India:—

Province	Net area cropped	Area irrigated by government irrigation works	Percentage of area irrigated to total cropped area	Capital cost of government irrigation and navigation works to end of 1923–4	Estimated value of crops raised on areas receiving state irrigation
	Acres	Acres	%	Lakhs of rupees	Lakhs of rupees
Madras	36,424,000	6,891,000	18·9	1,207	3,556
Bombay Deccan	39,000,000	418,000	1·0	881	538
Sind	4,134,000	3,427,000	82·9	479	1,054
Bengal	22,806,000	93,000	0·4	422	78
United Provinces	35,011,000	1,979,000	5·6	1,577	1,348
Punjab	26,731,000	10,207,000	38·2	2,543	5,505
Burma	13,857,000	1,730,000	12·5	363	812
Bihar and Orissa	24,665,000	954,000	3·9	627	622
Central Provinces	17,427,000	438,000	2·5	483	281
North West Frontier Province	2,583,000	359,000	13·9	276	226
Rajputna	281,000	16,000	5·7	35	5
Baluchistan	286,000	26,000	9·0	32	5
Total	223,205,000	26,538,000	11·9	8,925	14,030

Thus nearly 12% of the net area cropped was irrigated by government works. The annual value of the crop so irrigated amounted to 1½ times the capital outlay expended on the works.

New Schemes; Madras Presidency.—(1) The improvement of the, at present, somewhat irregular supply of water in the Canvey Delta canals will add about 301,000 ac. to the 1,000,000 ac. already served. (2) The Vengalapuran scheme will provide water for 50,000 acres. (3) The Kishna river storage will serve about 1,750,000 acres. The Lower Bhavari project will command 110,000 acres.

Bombay Presidency.—Although only 1% of the land cropped was irrigated in the Bombay Deccan district, its annual average of irrigated land is now about 418,000 acres. The Bhavari river works and the Nira right bank canal scheme will increase this area by 35,000 acres.

Sind.—The rainfall in Sind averages only about 6 in. per annum. In one year out of five it is almost certain to be less than 2 inches. Sind, however, has the Indus carrying a supply of water which is capable of meeting her needs if properly utilised.

In 1926 inundation canals supplied what land is irrigated. There are no means of regulating the river level artificially and continuing the supply when the river falls, consequently these canals obtain a full supply only when the Indus is in flood. In the cold weather when the river is low, only the most fortunately situated obtain any supply at all and a minimum of 600 tons per sec. run to waste.

The cultivable area of the province is about 14,000,000 acres. The Indus is estimated to be capable of irrigating 12,000,000 ac. in the hot weather and 8,000,000 ac. in the cold season, or say 20,000,000 ac. in all of crop. In 1923–4 the net area cropped was 4,134,000 ac. of which 82·9 % or 3,427,000 ac. was irrigated; this is the highest percentage of irrigated to cropped area in the whole of India. The province naturally divides itself up into three main tracts, upper, central and lower Sind, and three large barrage projects are contemplated at an estimated cost of £50,000,000 to deal with them.

The main project now in hand consists of a barrage across the Indus just below Sukkur where the river passes through a deep gorge. From the barrage, seven canals (four on the left bank and three on the right) will run southwards and extend facilities for cultivation to the enormous area of 5,500,000 acres. 2,000,000 ac. represent the existing inundation irrigation area and will be given in addition an assured perennial supply by the new canals. The barrage when completed will measure 4,725 ft. between the faces of the regulators on either side. It will have a masonry floor across the river, above which an over-bridge of 66 spans, each of 60 ft., will be constructed. From this over-bridge shutters 60 ft. long and 18½ ft. high can be lowered on the floor when the river falls, thus pounding up the water to the level required in the canals; conversely, when the river rises, they can be lifted and the whole of the waterway of the bridge will be left free for the passage of the annual floods. These floods will be greater than those passing any other regulating structure in the world, at the maximum they will be nearly double the Nile flood.

The supply required by the whole system of canals will vary throughout the year from 22,600 cu. ft. per sec. in Jan. and Feb. to 46,000 cu. ft. per sec. from June to September. It is estimated that the annual net revenue after paying working expenses will be 10½ % on the capital expended. This is the return from water rates alone, but a further large increase in general revenues may be reckoned upon from the 3,500,000 ac. of waste land which will be brought under cultivation.

Bengal.—The percentage of 0·4 of irrigated to cropped area in Bengal is the lowest in the whole of India, the net area cropped being 22,806,000 ac. of which only 93,000 ac. are irrigated. The average rainfall is about 55 in. per annum. A project for a canal from the Damodar river is sanctioned which will irrigate 196,000 acres. Several minor works are being considered.

Punjab.—With the exception of Sind no portion of India is so favourably situated as regards its rivers, or so unfavourably as regards its rainfall, as the Punjab proper, expecially the tract between the Jhelum and the Sutlej—the greater portion of this district having less than 15 in. of rainfall per annum and much of it less than 10 inches. As a consequence great developments have already taken place in the irrigation scheme of the province. In all 10,207,000 ac. were irrigated in 1923–4. Further large works are contemplated which will increase the total and reduce to a minimum the waste areas.

The United States

One of the larger projects is that connected with the Colorado river which serves two distinct areas. The upper is at a considerable elevation above sea level and covers 4,500,000 acres. Of this about 1,500,000 ac. are now irrigated. In the lower basin there are 960,000 irrigable acres, of which about 670,000 are irrigated. When the works are complete the Colorado river will be controlled to a very large extent and thus reduce the dangers arising from excessive floods.

An interesting feature of U.S. irrigation works is the series of very high dams which have been built to control and conserve river supplies. The Elephant Butte dam has a height of 306 ft. and the reservoir has a storage capacity of 3,200,000,000 tons of water. So far this is the largest reservoir in the world. The Shoshone dam has a height of 328 ft. and has a capacity of 550,000,000 tons of water. The Roosevelt dam has a height of 280 ft. and the reservoir has a capacity of 1,650,000 tons of wa
The Arrowrock dam has a height of 348·5 ft. and the reser
has a capacity of 340,000,000 tons of water. The Pathfi
dam is 218 ft. high and the reservoir can contain about 1,3
000,000 tons of water. In all, the Bureau of Reclamation ha
schemes either in operation or in process of construction.

Canada

Irrigation in Canada has been so far very partially develo
and only in those provinces where extensive farming operat
are in progress, such as Alberta, Saskatchewan and Manit
Developments are based upon the administration of the Fed
Irrigation Act of 1894, under which the ownership of all sur
water supply is vested in the Crown and the latter grants
necessary licences for its use.

Occasional droughts occur all over the wheat-growing be
provision, however, is steadily and systematically being m
to supply as much as possible irrigation water to counte
their effects. The government authorities are systematic
obtaining data with a view to providing the maximum a
financially possible with water and are yearly carrying
expensive systems of irrigation.

On the eastern section of the Canadian Pacific Railway
a census of the yields obtained and the water used by a grou
10 farmers during the past season, 1924, shows that the aver
yield of wheat on these 10 farms was 19½ bu. per ac. with
irrigation of 4 in. deep plus rainfall; with two 4-in. irrigations
yields received were from 30 to 35 bu.; and with three 4-in. i
gations were as high as 43 bu. per acre. In this district the to
precipitation for 12 months was 11·24 in. of which 9·68 in.
during the growing season. The water available for irrigati
varies greatly in different provinces, some are much more favo
ably situated than others to receive it and certain provinces
the other hand hardly require irrigation. That the total wa
resources of Canada, however, are enormous can be gauged fr
the fact that it is estimated that there could be developed w
it 41,400,000 H.P. of which only 3,227,414 h.p. was being us
up to Feb. 1 1924. Some of the more important irrigation are
are mentioned below.

Alberta.—About 1,000,000 ac. were irrigated in 1923, of which 1,3
000 ac. were brought in about 20 years ago in the Lethbri
section.

Canadian Pacific Railway, Western Section.—A scheme has be
in operation in this district for about 16 years, the area be
218,980 acres. The 1923–4 season was, however, so ideal for c
production, owing to favourable moisture conditions, that lit
irrigation was used, and only 3,074 ac. were irrigated, chiefly
alfalfa and meadow grasses.

Canadian Pacific Railway, Eastern Section.—Irrigation has bee
in operation in this section for about 10 years, the total irrigab
area is 400,000 ac. which are gradually being developed, and
which 124,000 have been taken up. The conditions here rend
irrigation more necessary than in the western section owing to lowe
precipitation and slightly higher temperature.

Taber District.—Irrigation was established in May 1924; in th
Taber district. Of 17,244 irrigable acres, 3,625 ac. have already bee
taken up and irrigated.

Lethbridge Northern Irrigation District.—This project was com
pleted in May 1923. The irrigable area is about 105,000 acres.

United Irrigation District.—The irrigable area of this scheme
about 36,000 acres.

New West Irrigation District.—The irrigable area is 4,500 acres.

Bellaw Lomond Irrigation District.—The irrigable area is abou
55,000 acres.

There are other smaller installations now working, and man
more are proposed.

Irrigation in Australia

Owing to the lack of an adequate rainfall the advantages o
irrigation appealed many years ago to Australians. At first the
object aimed at was to develop in unoccupied territory. Whil
these efforts generally proved successful, in recent years the
policy has been to extend irrigation to existing pastoral settlements, and some very large conservation of flood water schemes
have been carried out under which considerable areas of land
are now in process of intenser settlement.

v South Wales.—The principal works in this state include:—
Murrumbidgee Gravitation Irrigation Scheme. –The Murrum-
river is controlled by a dam 240 ft. high at Burrinjuck which
onserve about 960,000,000 tons of water. The scheme is to
e about 200,000 ac. of which 120,000 ac. were settled by June
They are mainly devoted to vegetable and fruit-growing and
ng purposes.
Pump Irrigation Areas.—(*a*) At Curlwaa on the Murray river
2,000 ac., out of an area of about 10,600 ac., are receiving
ion. (*b*) At Hay about 1,000 ac., out of an area of 4,500 ac.
ceiving water from pumps on the Murrumbidgee river.
Projected Schemes.—New South Wales is investigating schemes
will utilise its share of the Murray river waters and which it
s may amount to 150,000,000 tons. This should bring under
ion an area of at least 100,000 ac. of land. It has also under
leration a number of smaller schemes affecting the Lachlan,
uarie, Hunter, Namoe and Peel rivers, but it is not possible to
ny estimate as yet of the areas which may be irrigated by them.

toria.—In Victoria the principal irrigation works are on
oulbourne, Murray, Loddon, Werribee and MacAllister
s. While the works for some of these schemes were com-
d before 1910, the areas to be irrigated are still only in proc-
f settlement and extension of the works are from time to
taking place. In 1923, 350,727 ac. were irrigated.
der the Goulbourne scheme, which comprises an area of
t 850,000 ac. and where 800,000,000 tons of storage has
dy been provided for, a dam is being built at Sugarloaf in
tages, the first one of which was so far completed that stor-
f water took place in 1922. It may ultimately be 190 ft. high
may eventually contain about 1,100,000,000 tons of water.
Murray river scheme already serves an area of 340,000 ac.
s capable of expansion when the Hume storage reservoir is
leted. This will form the largest sheet of fresh water in
ralia, as it will cover 47 sq. m. and may contain about
,000,000 tons of water. The Loddon river gravitation scheme
s 74,000 acres. The Werribee river gravitation schemes
acchus Marsh and Werribee serve 3,350 and 10,000 ac.
ctively.
e Mildura pump irrigation scheme lifts water from the
ray river and serves 45,000 ac., of which 13,000 ac. are under
se cultivation. The MacAllister river scheme consists of a
ge reservoir from which a gravitation supply will command
t 80,000 ac. and is far advanced. These watering schemes
usually conjoined with domestic water supply schemes for
s and villages, and do not in the ordinary sense irrigate
, although they do, in fact, make great areas of land avail-
for pasturing purposes. There are also some flood protec-
schemes, one of which at Kooweerup and Cardinia enabled
000 ac. of land to be brought into cultivation.
eensland.—The Dawson valley scheme now under construc-
comprises a dam 140 ft. high at Nathans Gorge to impound
it 3,100,000,000 tons of water. When completed it will be
second largest reservoir in the world. The area to be served
bout 250,000 acres. The Inkerman irrigation area of 4,500
is served by 230 shallow well pumps. Provision is being
le to increase it to 10,000 acres. There are a number of
ller pump schemes at Townsville, Rockhampton, Bingera
Fairymead, which collectively serve about 4,000 acres.
outh Australia.—The Rennearth scheme serves 7,850 ac.,
nly fruit producing. The Murray river pumping plants
e 17,800 ac. and are being extended to serve a further 11,000
s. The Cadett scheme serves about 1,200 ac. and is supplied
water pumped through 90 ft. of height. The Waikerie
eme serves about 9,800 ac. and has the water lifted through
ft. of head.
he Kingston scheme serves 500 acres. The Moorook scheme
es 1,000 acres. The Cobdoyla scheme is ready to serve about
o ac. which can be increased to 30,000 ac. of irrigable land.
Berni scheme serves 7,700 acres. The Chaffey scheme will
e 14,000 acres. The Murray Swamp land scheme will even-
lly make available for irrigation 13,700 ac. of which 5,800
are now cultivated. Smaller schemes serve about 10,000
in all. In Western Australia the Harvey irrigation scheme
es 4,000 acres.

THE UNION OF SOUTH AFRICA

Irrigation was at first confined to small schemes whose entire works usually lay within the boundary of one farm. Works of greater magnitude were made easier of accomplishment when the Govt. of the Cape of Good Hope, to encourage irrigation, passed the Act of 1876 known as the "Right of Passage of Water Act" in terms of which a proprietor was permitted to conduct water over the property of any other owner.

A further Act in 1877 provided for:—

(*a*) The establishment of Irrigation Districts and Boards,
(*b*) The granting of government loans to private individuals, and
(*c*) The repayment thereof at the rate of 8% per annum over a period of 24 years.

In the case of private schemes, both in the Cape and in the other provinces also, no complete record of the irrigable area has been made and even in the case of Board schemes such data as are available are frequently not based on actual surveys but are only estimates of the irrigable areas made during the earlier stages. Since 1916 great progress has been made with irrigation based upon conservation of water schemes.

The completed schemes, although numerous, are individually small in area, none exceeding 10,000 acres. Among those under construction or development are some of considerable magnitude. These latter include the Great Fish river scheme, where 75,000 ac. are to be irrigated, the Sundays river scheme of 36,000 ac. and the Kamanassie river scheme of 28,000 acres. The area of land under irrigation in South Africa as at March 31 1923 under Board schemes was about 130,000 ac. and the area to be served by works under construction is about 225,000 acres. Up to 1925 the state expended over £4,000,000 on completed schemes. Neither interest nor redemption can be paid on this sum until the land is wholly settled.

WORK IN CHINA

China with its huge population of about 300,000,000 has no doubt a very large area of irrigated land but no statistics are available as to its extent except in a few small special districts where Europeans reside or have commercial interests. Hitherto engineering has been largely devoted to preventing the rivers in more than average floods overflowing their banks and inundating the land, an effect which has been many times accompanied by great loss of life. Commissions have studied river control and the conservancy boards in recent years have reported on and carried out important works with this end in view.

Quite obviously there is a large field in China for this form of development, and no doubt in time it will be followed by the more usual irrigation works. The following opinion of the engineer reporting on the Yangtse in 1923 gives a remarkably clear indication of the conditions there—it applies with equal force to the other great rivers of China.

> To anyone who has inspected the Yangtse from the Goyes to the sea, and who has given the faintest consideration to the question of restraining a river of this magnitude in its course through hundreds of miles of low-lying land, thousands of square miles of its area being below high water level, and therefore subject to inundation, it must be obvious that draining works, to be effective, would have to be constructed on a gigantic scale, and although the river is, in itself, and its tributaries and creeks, practically the one means of transport and communication serving a population of nearly 200,000,000 people with ever-growing transport requirements, it must be obvious that, unless improvement works can be made self supporting, it is futile seriously to embark upon them. Such are the conditions which prevail to-day and so they must remain for many years; in fact, until the growth of trade and growth of means which would follow thereon bring the necessity for works within the bounds of commercial possibility.

DEVELOPMENTS IN OTHER COUNTRIES

'Iraq.—The construction of the Hindia barrage was one of the first steps undertaken. In 1925 the Diala Cotton Co. inaugurated a great scheme whereby 108,000 ac. will be fertilised by water from the Diala river, a tributary of the Tigris. The company, it is understood, intends to extend its operations as fast as possible under its concession; and a time can be envisaged when adequate control of the Euphrates and Tigris, under conditions

of peace and good government, will allow of great areas of the arid plains of 'Iraq to be once again cultivated.

Spain and Portugal.—Irrigation has been developed in a number of places in the peninsula since the beginning of the century and schemes for further works are being considered. None of those so far completed are of any great magnitude, but among the proposals there is one for the irrigation of 120,000 ac. on the Guadalquivir. The possibilities of this river are being studied for other areas, and are great if by regulation of its excess flow in flood time its waters can be conserved for use in the drier periods of the year. On the Tagus a scheme near Villa Franca is now being surveyed which, if carried out, will enable 30,000 ac. to be irrigated.

Arabia.—An interesting irrigation development is the possibility of reviving agriculture by its aid in the Yemen. A syndicate is now (1926) studying a project to examine the many reservoirs which in ancient times controlled flood waters for the benefit of agriculture in that region.

Mexico.—In Mexico, and particularly in northern Mexico where the rainfall is negligible in the lower or plain country, strips of land are cultivated near the rivers by irrigation. The total area is considerable, but there are no records of its extent. The works are somewhat primitive but have been constructed entirely by private enterprise and good results in crop are obtained from them.

South America.—An irrigation scheme on the Rio Negro was carried out in 1914 whereby 230,000 ac. are being developed. There are other minor irrigation works in the country. There are irrigation works, carried out almost entirely by private enterprise, in the other South and Central American republics.

(M. Mac.)

IRWIN, EDWARD FREDERICK LINDLEY WOOD, 1st Baron (1881–), British politician, was born April 16 1881. The only surviving son of the 2nd Viscount Halifax, he was educated at Eton and at Christ Church, Oxford, being elected fellow of All Souls College in 1903. In Jan. 1910 he was returned to Parliament as Conservative member for the Ripon Division of Yorkshire, and retained his seat until 1925. During the World War he served in France 1915–7 with the Yorkshire Dragoons, in which he held the rank of major, being mentioned in dispatches, and was an assistant secretary to the Minister of National Service 1916–8. In April 1921 he was appointed Under-Secretary of State for the Colonies. In this capacity he made a tour of the West Indian colonies, and published his conclusions on the administrative and economic problems which he encountered in a report issued in June 1922. From Oct. 1922 to Jan. 1924 he was President of the Board of Education. In Nov. 1924 he became Minister of Agriculture and Fisheries in Mr. Baldwin's second Government. In Oct. 1925 he was appointed governor-general of India in succession to the marquess (then earl) of Reading, being raised to the peerage as Baron Irwin of Kirkby Underdale two months later. Like his father, Lord Irwin, who had been sworn of the privy council in 1922, took a keen interest in ecclesiastical affairs, and published a study of John Keble in the "Leaders of the Church Series." He married in 1909 Lady Dorothy Onslow, younger daughter of the 4th Earl of Onslow by whom he had three sons and two daughters.

ISHII, KIKUJIRO, Viscount (1866–), Japanese diplomatist, was born at Chiba, Japan. Like other members of his family, he was destined to enter official life. His intention was to become a lawyer, but his studies in international law gave him a deep interest in foreign affairs. His early days were full of incident: the Meiji reconstructions took place before his eyes, and the constant stream of foreign influences soon aroused in him a desire to see and understand other countries. Leaving the law faculty of the Imperial University in Tokyo in 1890, he was made attaché to the Japanese Legation in Paris. During his stay in Paris he applied himself to the study of European languages and became proficient in French and English. He was made third secretary in 1893, and about this time he devoted much attention to the problems of economics and international trade. He was distressed to observe that Japan did not h such a position in the world's mart as in the opinion of m Japanese she deserved, and he set himself to find out the ca of the trouble. He endeavoured to form a Franco-Japan mutual trade association, and although his efforts did not first meet with the full success he desired, a certain stimu was at once felt. Some part of the fruits of Ishii's labours w seen in the commercial mission which was sent from France Japan in 1925.

In 1896 he was appointed Consul to Chemulpho (Jinsen) Korea. After this he was made second secretary and later fi secretary at the Japanese Legation in Peking. He was, the fore, in Peking in an official capacity during the Boxer risi In 1900 he was appointed Secretary of the Head Office and ch of the telegraph section of the Home Office Department, whi post he held until he became director of the Commerce Bure in 1904. In 1907 he was sent to San Francisco and Vancou in connection with the anti-Japanese riots there. His success this matter was the direct cause of his appointment in the follo ing year as Vice-Minister for Foreign Affairs. His love of Fran and understanding of French problems made him an easy favo ite for the ambassadorship to Paris in 1912, and on his retu he took over the portfolio for Foreign Affairs in the new Gove ment. He was chief of the Foreign Office for the period 1915- and in the latter year he was created Viscount, having be made Baron in 1912. He played a great part in American-Ja anese relations and was a special envoy to the United States 1917. He was nominated a member of the House of Peers 1916. In 1920 Viscount Ishii was for the third time officia delegated to Paris.

Perhaps Ishii's greatest claim on his country's gratitude w his work in connection with the so-called "Gentlemen's Agre ment" made between Washington and Tokyo in 1907. Lansi was the United States representative in the negotiations, f which reason the arrangement is sometimes called the "Lansin Ishii Pact." The western coast of the United States made re resentations to Congress deploring the increasing immigrati of Asiatics, notably Chinese and Japanese. It was claimed th owing to the Asiatic standard of living being lower than that Americans, there was a serious possibility of California becomi a Japanese colony, and the aid of legislation was invoked. Th Lansing-Ishii pourparlers resulted in the postponement of su gested legislative measures, and a yearly maximum (tentativel fixed at 150) was proposed. Japan, through Ishii, agreed not t issue passports for more than this number annually to enter th United States as residents, and it was through Japan's allege breach of faith in connection with this agreement that the Imm gration Restriction Act was passed by Congress in 1924. I substance, this Act was one of the proposals originally shelve by the labours of Lansing and Ishii.

In Dec. 1920 Viscount Ishii became Japanese delegate to th 11th session of the Council of the League of Nations. In Au 1923 he became President of the Council of the League and in th following month was one of the Vice-Presidents of the Assembly In Sept. 1925 he was again a Vice-President of the Assembly In March 1926 he was President of the Council at its 39th ses sion, and as such acted as President of the Assembly (Marc 1926) until the election of the new President. (A. N. J. W.)

ISLAMISM: *see* PAN-ISLAMISM.

ISMET PASHA (1884–), Turkish statesman, was born in Smyrna of a Turkish family of Malatia. He received his educa tion in the military schools of Turkey, and in 1903 graduated a an artillery lieutenant. Three years later he became a captain on the General Staff. After the Young Turk revolution of 1908 he was sent several times on military expeditions to Yemen During the World War he served with distinction on the Syrian front, and at the close of the War held the rank of colonel, and commanded an army corps. During the Armistice he occupie important positions in the War Office. At the time of the occupation of Constantinople by the Allies he escaped to Angora disguised as a common soldier and was appointed by the Great National Assembly to be Chief-of-staff during the military opera-

of the Nationalists against the Caliphate army and Ar-
Later he became Commander-in-chief of the Turkish
rn front, and in this capacity insisted on the formation of a
ar army in place of the irregular Nationalist forces. In the
time, the irregular forces were unwilling to submit, and the
Army had taken the offensive. At Ineunu, Ismet defeated
reeks, checked their offensive, subdued the irregular forces,
ucceeded in completing the organisation of a regular army.
emained in command of the western front until after the
on the Sakharia and the fall of Smyrna, in which events he
he right-hand man of Mustafa Kemal Pasha. In 1922 he
d the Armistice concluded at Mudania with the Allies, and
eded in securing the evacuation of Eastern Thrace. In
3, as Minister of Foreign Affairs and senior Turkish dele-
to the Lausanne Conference, he most ably defended the
ests of his country, and signed the Treaty of Lausanne.
ring the autumn of 1923, at the time of the declaration of
epublic, he became Prime Minister. After a short rest, due
iling health, he became Prime Minister a second time, to-
s the end of 1924, and shared in the suppression of the Shiekh
revolt in Kurdistan. The abolition of the Caliphate, the
ng of the medressehs (religious schools) and of the tekkes
asteries), the abolition of the tithe, the adoption of the
civil code, and the wearing of the hat are some of the mo-
ous changes which were realised during Ismet's tenure of
.

ONZO, BATTLES OF THE: *see* ITALIAN CAMPAIGNS.

OSTASY.—When the great Trigonometrical Survey of India
initiated, it was found that the deflection of the plumb-line
he Himalayas was much less than the calculated amount
to the theoretical attraction of the visible mass of the moun-
Sir G. B. Airy suggested that this might be caused by the
ence of a mass of matter, of less than the average density,
r the mountains; this explanation was further investigated
rchdeacon J. H. Pratt, who applied the term "compensa-
" to the negative effect of the underlying defect of density,
mpensating the direct effect of the attraction of the visible
of the mountains.

1892 Maj. C. E. Dutton, discussing the greater problems of
ical geology, deduced a general principle that the weight of
ter under any unit area of the earth's surface tended to be-
e uniform, and suggested that this was brought about by an
rground transfer of material to balance the visible surface
sport from regions of erosion to those of deposition. To this
ciple he gave the name *isostasy* (*ἴσος* equal, and *στάσις*
tion), not as a synonym for Pratt's compensation, but as a
e for the principle and process, by which it was brought
t. In 1909 there appeared a very complete and elaborate
stigation of the subject by J. F. Hayford, in which the word
stasy" is used as synonymous with what Pratt called "com-
sation," and this use of the term has since become general
ng geodesists. Some inconvenience results from this two-
use of the word, to express either a measurable effect, or one
ry of the cause by which this effect is produced; but the
ge is too firmly established to be overcome, and the incon-
ience is lessened as it has become recognised that the deep-
ed variations in density, and consequently in bulk, to which
hdeacon Pratt gave the name "compensation," may be the
nary phenomenon and cause of the major differences of sur-
level. (*See* also GEODESY; GEOLOGY.)

(R. D. O.)

SOTOPES (Gr. *ἴσος* equal+*τόπος* place), is the term first ap-
d by F. Soddy in 1913 to substances which, though they had
rent atomic weights, yet had identical chemical properties
occupied the same place in the periodic table of the elements.
r a century earlier Dalton had postulated that atoms of the
e element are similar to one another and equal in weight. A little later Prout suggested that the atoms of all elements were composed of atoms of a primordial substance which he endeavoured to identify with hydrogen.

If both these theories were right, the atomic weights of all elements would be comparable with each other as whole numbers. This the chemists soon showed was quite incompatible with experimental evidence. It is true that many were very nearly whole numbers, far too many for the effect to be pure chance, but others, like chlorine, were hopelessly fractional. Of the two alternatives Dalton's is much the simpler from the chemical point of view and was therefore quite rightly chosen as a working hypothesis. From this in course of time it developed into an article of scientific faith, and, despite the complete absence of positive evidence in its support, no serious questions as to its validity were raised until late in the 19th century. Of such speculations those of Crookes were founded on unsound evidence and were soon discredited. The question could not be settled by ordinary chemical methods, which employ countless myriads of atoms and could therefore only give a mean result, and it was only by the discovery of radioactivity and the development of accurate methods of weighing individual atoms that the existence of isotopes was disclosed. The two advances were nearly contemporaneous but the first definite convincing proof of isotopy was found among the radioactive elements and their products.

The Radioactive Isotopes.—In 1906 Boltwood discovered ionium and found that it had similar chemical properties to thorium. Further research using the most delicate radioactive methods failed to indicate the slightest chemical separation of these two elements once they had been mixed, and even more surprising their spectra appeared to be identical. Other pairs of elements in the radioactive group showed corresponding identities and later investigations on the chemistry of the products of radioactive disintegrations enabled the chemical law of radioactive change to be formulated (*see* RADIOACTIVITY). This stated that a radioactive element when it loses an alpha particle goes back two places in the periodic table; when it loses a beta particle it goes forward one place. An alpha particle is a helium nucleus of weight 4, whereas a beta particle is an electron of negligible weight. It follows that if a body loses one alpha and two beta particles it will be back again in the same place in the periodic table although it will have lost a mass equal to four units of atomic weight.

Isotopic Bodies Predicted.—Supported by this law, which he was the first to state in its most general form, Soddy boldly claimed that these "isotopic" bodies would be both chemically and spectroscopically indistinguishable. He also predicted that the lead produced by the disintegration of uranium would have an atomic weight 206, while that of the lead produced from thorium would be 208, and that consequently the atomic weight of the lead found in uranium minerals should be less than that of ordinary lead (207·2) while that of lead from thorium minerals should be greater. These predictions were amply vindicated during the War by the work of experts on atomic weights (Richards, Hönigschmid and others), and it was shown beyond all dispute that the isotopic leads, though they differed by the predicted amount in properties such as atomic weight, density, and solubility which depend directly on the weight of their atoms, in all others, which do not—atomic volume, boiling-point, melting-point, refractive index and spectrum—were quite indistinguishable.

Practical Utilisation of Indicators.—The impossibility of separating isotopes has been utilised in ingenious manner by Hevesy and Paneth. By the addition of a small quantity of a radioactive isotope to an ordinary inactive element, the latter is, so to speak, indelibly labelled and can be followed by the methods of radioactivity, which are incomparably more delicate than those of chemistry. In this way the solubility of very insoluble salts can be readily determined. By the addition of a little thorium B, an isotope of lead, valuable information has been obtained on the assimilation of the salts of the latter element by living plants. The use of such radioactive indicators affords a direct proof of the ionic dissociation theory, it has led to the discovery of certain metallic hydrides and to the determination of the velocity of diffusion of molecules among themselves, an otherwise insoluble problem.

Positive Ray Analysis.—It is clear that the reasoning which led to the discovery of isotopes among the radioactive elements is inapplicable to those much more abundant ones which do not exhibit this property. Among the latter the presence of isotopes can only be demonstrated by weighing their individual atoms. This can be done by the analysis of positive rays, also called *Kanalstrahlen* or mass rays, which are electrically charged atoms of matter moving with such high velocities that they can be detected by means of their impact on a fluorescent screen or photographic plate. The usual method of producing these is by the discharge in gases at low pressure. In the region of the Crookes dark space and negative glow in front of the cathode the gas is ionised; that is to say, its atoms are split up into positively and negatively charged parts. The latter are the same whatever the nature of the gas, they are electrons and fly away from the cathodes constituting the well-known cathode rays. The remaining positively charged particles will fly toward the cathode. Their masses may vary from that of the lightest atom to that of the heaviest molecule in the gas, and their energies from an indefinitely small value to a maximum expressed by the product of the charge they carry, multiplied by the total potential applied to the electrodes. If the cathode be pierced, the rays pass through the aperture and form a stream of particles heterogeneous both in mass and velocity, which can be subjected to analysis.

The "Parabola" Method.—In Sir J. J. Thomson's "parabola" method of analysis, the particles, after reaching the surface of the cathode, pass through a long and very fine metal tube. By this means a narrow beam of rays is produced, which is passed through electric and magnetic fields causing deflections at right angles to each other, and finally falls upon a photographic plate. It can be shown that, if the mass of any particle is m and its charge e, when both fields are on together, the locus of impact of all particles of the same e/m, but varying velocity, will be a parabola. Since e must be the electronic charge, or a simple multiple of it, measurements of the relative positions of the parabolas on the plate enable us to calculate the relative masses of the particles producing them—that is, the masses of the individual atoms or molecules. The fact that the streaks were definite, sharp parabolas, and not mere blurs, constituted the first direct proof that atoms of the same element were, even approximately, of equal mass. For some time the results of the application of this method of analysis appeared to support the hypothesis of Dalton, as the elements introduced into the discharge tube gave single, or apparently single, parabolas in the positions expected from their chemical atomic weights. (*See* GASES, ELECTRICAL PROPERTIES OF.)

Examination of Neon.—But when, in 1912, neon was examined, the trace obtained was definitely double. The brighter curve corresponded roughly to an atomic weight of 20, the fainter companion to one of 22, the atomic weight of neon being 20·20. The line 22 could only be explained as due to a hitherto unknown elementary constituent of neon. This agreed well with the new idea of isotopic elements which was just then emerging from the investigations on radioactivity, so that it was of importance to investigate the point as fully as possible. The first line of attack was an attempt at separation by fractional distillation, but the result was entirely negative. The second method employed was that of fractional diffusion through pipe-clay which gave a small, but definite, positive indication of separation. It therefore seemed probable that neon was a mixture of isotopes.

The Mass-Spectrograph.—By the time that research on the subject was resumed at the Cavendish Laboratory in 1919, the existence of isotopes among the products of radioactivity had been proved beyond all reasonable doubt by the work on the atomic weight of lead. This fact automatically increased the value of the evidence of the complex nature of neon and the urgency of its definite confirmation. It was realised that separation could only be very partial at the best, and that the most satisfactory proof would be afforded by measurements of atomic weight by the methods of positive ray analysis. These would have to be so accurate as to prove beyond dispute that the cepted atomic weight lay between the real atomic weights of two constituents, but corresponded with neither of them. parabola method was not equal to this, but the required accura was achieved by means of an instrument shown in diagram in fig

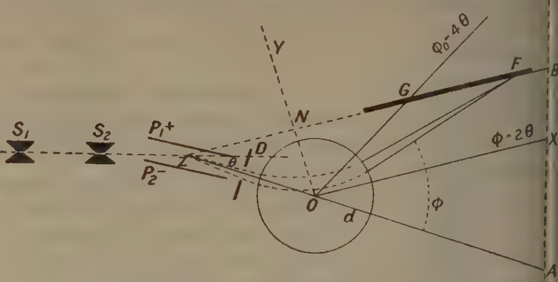

FIG. 1.—Diagram of Mass Spectrograph.

Positive rays are sorted out into a thin ribbon by two paral slits S_1S_2, and are then spread into an electric spectrum means of the charged plates P_1P_2. A portion of this spectrum d flected through an angle θ is selected by the diaphragm D and pass between the poles of a powerful magnet O, the field of which is su as to bend the rays back again through an angle ϕ more tha twice as great as θ. The result of this is that rays having a consta mass (or, more correctly, constant *em*) will converge to a focus and if a photographic plate is placed at GF as indicated, a spectru dependent on mass alone will be obtained. On account of its analo to optical apparatus, the instrument has been called a mass-spe trograph and the spectrum produced a mass-spectrum.[1]

Mass-Spectra.—Fig. 2 shows a number of typical mas spectra that are obtained by this means. The numbers abo the lines indicate the masses they correspond to on the sca o=16. It will be noticed that the displacement to the right wit increasing mass is roughly linear. The measurements of ma are not absolute, but relative to lines which correspond to know masses. Such lines due to hydrogen, carbon, oxygen and the compounds, are generally present as impurities or purposel added, for pure gases are not suitable for the smooth working the discharge tube. The two principal groups of these referen lines are the C_1 group, due to C (12), CH (13), CH_2 (14), C (15), CH_4 or O (16), and the C_2 group (24–30) containing th very strong line C_2H_4 or CO (28). These groups will be seen several of the spectra reproduced, and they give, with the CO (44) line, a very good scale of reference.

Mass Measurements.—Measurements of mass can be mad with an accuracy of 1 part in 1,000. It must be remembere that the ratio of mass to charge is the real quantity measured b the position of the lines. Many of the particles are capable c carrying more than one charge. A particle carrying two charge will appear as having half its real mass; one carrying three charge as if its mass was one-third, and so on. Lines due to these ar called lines of the second and third order. Lines of high orde are particularly valuable in extending our scale of reference.

When neon was introduced into this apparatus, four new line made their appearance at 10, 11, 20 and 22. The first pair (no shown in diagram) are second order lines. All four are well place for direct comparison with the standard lines, and a series o consistent measurements showed that to within about one par in a thousand, the atomic weights of the isotopes composin neon are 20 and 22 respectively. Ten per cent of the latter woul bring the mean atomic weight to the accepted value 20·20, an the relative intensity of the lines agrees well with this propor tion. The isotopic nature of neon was therefore settled beyon doubt. Spectrum I. on fig 2 (*see* next page) shows the first orde lines of neon and some of the reference lines with which they were compared.

Analysis of Chlorine.—The element chlorine was naturally the next to be analysed, and the explanation of its fractional atomic weight (35·46) was obvious at once. Its mass-spectrum is char-ed by four strong lines 35, 36, 37, 38. The simplest expla- of the group is to suppose that the lines 35 and 37 are due isotopic chlorines, and the lines 36 and 38 to their corre- ng hydrochloric acids. The elementary nature of 35 and ndicated by their second order lines at 17·5 and 18·5, and hen phosgene was used, by the occurrence of lines at 63 due to COCl^{35} and COCl^{37}.

---

[1] A full description of the Mass-Spectrograph is given in *Isotopes* by F. W. Aston, Cambridge University Press, pp. 44 *et seq.*

r it was found possible to obtain the spectrum of the nega- charged atoms of chlorine. This showed only two lines 37; so that the lines 36 and 38 cannot be due to isotopes element. These results show that chlorine is a complex t, and that its isotopes are of atomic weight 35 and 37. a II., III. and IV. show the results with chlorine taken with nt field strengths (*see* CHEMISTRY).

Elements.—As the work progressed with other elements interesting results were obtained. Some elements, such on and oxygen, were found to be "simple"; that is, not es of isotopes. This was to be expected from their whole-

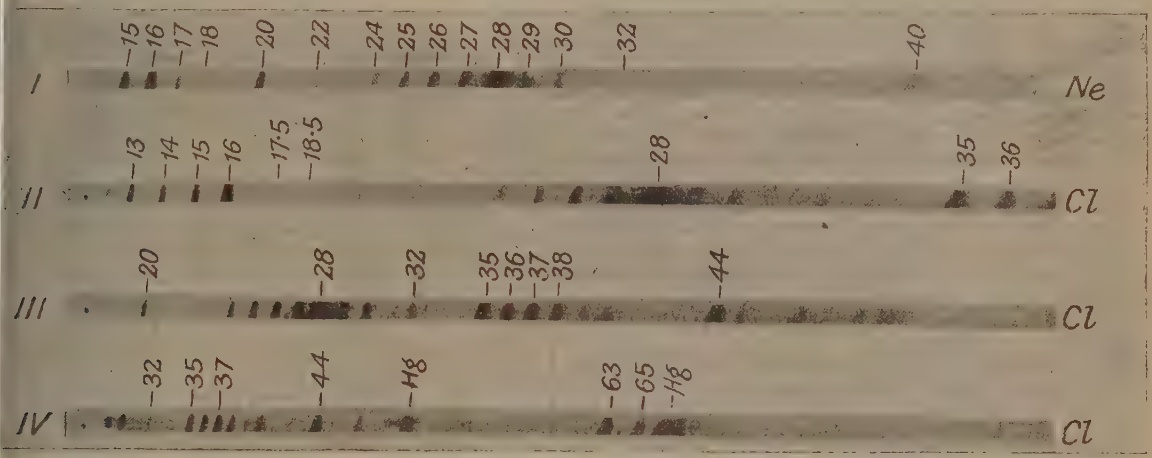

Fig. 2. Typical Mass Spectra

r atomic weights. Even more proved "complex," some ting of 7, and in the case of xenon possibly 9 isotopes. The exity of mercury is indicated by the blur of its unresolved and fourth order groups seen in spectrum IV. Its lines een resolved by means of a more powerful instrument. rays of the metallic elements, which are in the majority, t in general be produced in the ordinary vacuum discharge. can be investigated by means of anode rays.

constitution of the alkali metals was first discovered by se of an anode consisting of a platinum strip coated with f the metals, and heated electrically. Dempster, at Chi- produced mass rays of metals by heating the element in a e and ionising the vapour produced by electron impact. alyse the rays so formed he used low velocities and an ical method of detection. By this means he made the first ses of magnesium, calcium and zinc, and also confirmed sults already obtained for the lighter alkali metals.

re recently a large number of elements, including some of re earths, have been successfully attacked by means of the l method of "accelerated anode rays," and in all 56 out of known non-radioactive elements have been analysed into constituent isotopes or shown to be simple.

Whole-Number Rule.—By far the most important general of these investigations is that, with the exception of hy- n, the weights of the atoms of all the elements measured, herefore almost certainly of all elements, are whole num- to the accuracy of experiment. With the mass-spectro- , this accuracy is generally one part in a thousand. Of e, the error expressed in fractions of a unit increases with ass measured, but with the lighter elements the divergence the whole-number rule is extremely small. This enables ing simplifications to be made in our ideas of mass.

The original hypothesis of Prout can now be restated with the modification that the primordial atoms are of two kinds: protons and electrons, the atoms of positive and negative electricity. According to the modern theory of the nucleus atom (*see* ATOM; MATTER) all the protons and about half of the electrons are packed very close together to form a central, positively charged nucleus, round which the remaining electrons circulate, somewhat like the planets round the sun. All the spectroscopic and chemical properties of the atom depend on the net positive charge on the nucleus, which is the excess of protons over nuclear electrons. This is also clearly the number of planetary electrons in the neutral atom; it is called the "atomic number" and is actually the number of the element in the periodic classification: 1 for H, 2 for He, 3 for Li, and so on.

The whole-number weight of the atom, on the other hand, will be the total number of neutral pairs of protons and electrons it contains. This is also the number of protons in its nucleus, and is called the "mass-number" of the atom: 1 for H, 4 for He, 6 and 7 for the isotopes of Li, and so on. For the purpose of distinguishing isotopes it is customary at present to use the chemical symbol of the complex element with an index corresponding to the mass-number of the particular isotope, *e.g.*, Ne^{22}, Rb^{87}.

Packing Effect.—The whole-number rule is not mathematically exact, for owing to the extremely close packing of the charges of opposite sign in the nucleus, this will have a weight slightly less than the sum of the weights of its constituents. This loss of weight is called the "packing effect." Hydrogen, which has for its nucleus a single proton, will have no packing effect, and may therefore be expected to have an abnormally large weight. Comparison of this element with others by means of the mass-spectrograph, using special methods, shows that, within experimental error, the weight of its atoms on the chemical scale (O = 16) is indistinguishable from that obtained by chemical methods, namely, 1·0077.

The divergences of other elements are barely measurable at present, but the isotopes of lithium appear heavier than whole numbers by about 1 part in 1,000. Most of the heavier elements show a slight defect, which is to be expected if we take oxygen as having normal packing. The defect in the case of the isotopes of tin appears to be at least 2 parts in 1,000, which is 0·2 of a unit of atomic weight.

These considerations are of the greatest interest theoretically, for upon them rests the hope of the future liberation of the so-called "atomic energy." (*See* ATOMIC ENERGY.) The theoretical importance of chemical atomic weight has been somewhat reduced by the discovery that for so large a number of elements it merely represents a statistical mean. Its position as a natural numerical constant associated with an element has now been taken by the atomic number, which indeed defines the element, though from the point of view of chemical analysis, the mean atomic weight is as important as ever. The anomalies shown by those elements which, by their atomic weights, appear out of their right order in the periodic table, are now open to the simplest explanation. Thus argon, in which the heavier of two isotopes predominates, has a greater mean weight than potassium, in which the reverse is the case. The same explanation applies to cobalt, nickel, tellurium and iodine.

Since the atomic number only depends on the *net* positive charge on the nucleus, arithmetically any element can possess an indefinite number of isotopes. The table herewith shows that those present in detectable quantity are restricted both in number and range of weight, though the causes of these restrictions are at present unknown. No element of odd atomic number has more than two isotopes and, above atomic number 9, the mass-numbers of the isotopes always differ by 2, and the lighter is the more abundant constituent. The number of nuclear electrons tends to be even. That is, in the great majority of cases even atomic number is associated with even mass-number, and odd with odd. Beryllium and nitrogen are the only elements consisting entirely of atoms whose nuclei contain an odd number of electrons.

If the mass numbers of the various species of atoms are plotted against their relative abundance in the earth's crust, a strong preponderance of those of type 8n may be seen. There is an extreme difference of range between the abundance of isotopes in an element and elements in nature. In the case of elements of an odd atomic number this cannot be ascribed merely to lack of delicacy in the means of detection of their isotopes. Thus while there are only about three Cl^{35} atoms to one Cl^{37} and about two Ga^{69} atoms to one Ga^{71}, yet there are a thousand million more atoms of chlorine than of gallium. This suggests that isotopes have some relation in common more fundamental than that of identity of nuclear charge, an idea which is supported by other independent lines of reasoning.

Spectra of Isotopes.—As regards their series spectra, in which, on Bohr's theory, the two bodies concerned are an electron and an enormously more massive atomic nucleus, the prediction that isotopes should be indistinguishable is satisfied to a high degree of precision. So far the only effect detected is a minute difference of wave-length between the lines of Carnotite lead (206) and ordinary lead (207·2). The most accurate measurements by Merton indicate that this has a maximum value of 0·011 Å for the line $\lambda = 4058$. Smaller shifts are detectable in a few other lines, the wave-length for the lighter atom being the greater in all cases. In band spectra, where two nuclei are concerned, the isotope effects are much larger and in excellent agreement with theory. In the case of HCl bands in the infrared region the duplicate peaks are as much as 14 Å apart, and in position and relative intensity, correspond exactly with the results expected from the presence of HCl^{35} and HCl^{37}.

More recently by investigation of band spectra produced in the visible region by boron oxide and silicon nitride, Millikan has shown that separate band heads appear corresponding to the two isotopes of boron, in the one case, and to three isotopes of silicon in the other. These results constitute valuable independent confirmation of the results of the mass-spectrograph.

Separation of Isotopes.—It is perhaps a fortunate thing for the simplicity of chemical arithmetic that the artificial separation of isotopes is excessively difficult, while at the same time no process tending to that end in nature appears to exist at all. Of the artificial methods the only one giving complete separation is the actual analysis of the mass-rays, during which the isotopic atoms strike the plate at different points and therefore, if collected, would yield pure specimens. The quantities so produced would, with the means at present available, be far too minute to be of any practical value.

A large number of methods for partial separation have been suggested and tried. The first successfully used, which is only applicable to gases, is that of free diffusion through pipe-clay or other suitable porous material. The diffusion rates are inversely proportional to the square roots of the masses concerned. It follows that if a large volume V of a mixture of isotopes is allowed to diffuse, leaving a small residue *v*, the latter will be
in the heavier constituent than was the original gas. The a
numerical value of this enrichment, under ideal conditions,
isotopes, such as those of neon, which differ by 10% is only 20
so that only by the use of very large volumes, or laborious
titions, can any measurable change be achieved. The ori
experiments with neon gave a shift of atomic weight of ra
more than 0·1 of a unit. Harkins, at Chicago, by the u
19,000 litres of HCl, was able to obtain considerable sampl
which the atomic weight of chlorine differed by 0·055 unit.

Table of Elements and Isotopes

Element	Atomic number	Atomic weight	Minimum number of isotopes	Mass numbers o isotopes in order intensity
H	1	1·008	1	1
He	2	4·00	1	4
Li	3	6·94	2	7, 6
Be	4	9·02	1	9

LIAN CAMPAIGNS.—Italy entered the World War as a tant on May 23 1915, when she declared war on Austria. ollowing article constitutes an outline of the struggle be- Italy and Austria from that date until the signing of the -Italian Armistice on Nov. 3 1918. The article has been d into five sections, namely: I. Italy's Strategical Position; he First Year's Campaign; III. Battles of the Isonzo and arso; IV. The Austro-German Effort; V. The Collapse of a. More detailed accounts of the outstanding battles in mpaign are given under separate headings, namely: Asiago, E of; Caporetto, Battle of; and Vittorio Veneto, E of.

I. ITALY'S STRATEGICAL POSITION

the outbreak of the World War the Italian General staff worked-out plan for an offensive campaign against Aus- ungary. The great military superiority of the Habsburg e and the unfavourable frontier drawn in 1866 seemed to the possibility of Italian offensive action. A glance at the nakes the position clear.

ginal Italian Plan.—When Italy was preparing to enter the the fact that Austria-Hungary was already heavily engaged ere offered the chance of an Italian attack, and Gen. Ca- , who took command on the declaration of war, had worked is scheme in expectation of simultaneous offensive action part of Russia and Serbia. The plan was based on the idea taly must hold on the north and push towards the east. astern front, though difficult enough, seemed less impervi- an offensive than the Alpine masses on the north. An in this direction was calculated to occupy a much larger er of enemy troops, which was obviously a part of Cador- uty, and was further a direct threat against a vital part of onarchy. These advantages were rightly held to compensate e fact that an advance eastward meant the lengthening of t already very long, and increased, moreover, the menace Trentino salient.

s threat was mitigated by the expectation of Allied action northeast and southern fronts of Austria-Hungary, which prevent the enemy taking advantage of the weakness ted. But, on the eve of Italy's declaration of war, the situa- ad changed. The Russian armies north of the Carpathians given way before the attacks of Mackensen and Böhm- lli. There was no word of movement, even of demonstra- on the part of Serbia, in spite of requests from the Allies, n May the Austro-Hungarian troops on the Serbian front reduced by five divisions, which were sent to the Isonzo- front, their place being taken by three newly-formed Ger- livisions.

Disposition of the Forces.—On the eve of war Cadorna's dispositions were as follows: Gen. Roberto Brusati's I. Army, with five divisions and 10 Alpine battalions, was to conduct a limited offensive in the Trentino, with the object of shortening the line and securing strong defensive positions. Gen. Nava's IV. Army, five divisions and seven Alpine battalions, was to attack the enemy communications in the Pusterthal and co-operate in an advance towards Tarvis; this advance was to be carried out by the "Carnia Force," consisting of one infantry division and 16 Alpine battalions under Gen. Lequio. The II. and III. armies, under Gen. Frugoni and the Duke of Aosta respectively, were to attack with all speed on the Isonzo front. Frugoni had eight divisions and the Duke of Aosta six, with three cavalry divisions. But on May 24 only three corps (seven divisions) and three cavalry divisions were ready to attack.

On May 20 the Austrian armies, which had been placed under the command of the Archduke Eugene, with Gen. Krauss as his chief-of-staff, formed little more than a screen. Gen. Dankl, lately in command of the Austrian I. Army, had about two divisions in Tirol, with some Landstürm battalions; Gen. von Rohr had a similar force to oppose an advance on Tarvis; and the Isonzo front, from Monte Nero to the sea, was lightly held by three divisions under Gen. Ludwig von Goiginger. But reinforcements were close at hand. Within a few days Rohr had two more divisions at his disposal, and by May 27 Gen. Boroević von Bojna, to whom the Isonzo front had been entrusted, had 90 battalions between Monte Nero and the sea.

II. THE FIRST YEAR'S CAMPAIGN

The opening moves of the Italian offensive, all-important as they were in relation to the future operations, failed to obtain the results hoped for in Cadorna's design. The I. Army performed its limited task quickly and satisfactorily, but the IV. Army was very slow. Here, almost certainly, a good chance was missed. Lequio's Carnia force was quick to move and found that the enemy was equally quick. This sector was all-important to the Austrians, from the point of view both of offence and defence. It was essential to prevent a break-through to Tarvis and Villach, and if they could hold the frontier line it preserved for them the chance of the attack down the valleys leading to the Tagliamento. Here alone the way was blocked against any but an overwhelming force.

Italy Takes the Offensive.—Meanwhile, the II. and III. armies were on the move. Frugoni, with the five divisions of his army that were ready, attacked along the line of the Isonzo from the Saga to opposite Gorizia. The Duke of Aosta, with a single corps and two cavalry divisions, was to force the passage of the lower Isonzo and push on towards the Carso. The Austrians had withdrawn beyond the river, except at the two strong bridge-heads opposite Tolmino and Gorizia, which were held in force, and south of Gorizia the line of defence chosen was the Carso plateau. Speed and initiative were essential if the opening moves of the Italian offensive were to be successful, and at various points speed and initiative were lacking. The bridge-heads were invested, as were several other strong positions held by the enemy.

On the other hand, the country is extraordinarily difficult, and roads were few and mostly bad; and those which were suitable for the movement of troops and guns led only to the points which the enemy was holding in some force. Fortune, too, was against the attacking armies. Appalling weather made movement in the mountains almost impossible during the critical period, and when the chance of a surprise had gone the great barrier of the Julian Alps was an insuperable obstacle to such forces as the Italians could bring against it. Guns, machine-guns and transport were lacking. Farther south, in the plain west of the Carso, the Isonzo came down in sudden and violent flood and held up the Duke of Aosta's advance. The fords were impassable and bridges had been blown up by the retreating enemy.

By the end of the third week in June the Italians had gained several important positions, some of them after very hard fighting, but they had been brought to a stop before the Austrian

main lines, and it became clear that the hopes of a war of movement must be given up, that only the slow processes of trench warfare could lead to success. The Italian mobilisation was now completed, and Cadorna had ready some 35 divisions. Against these the Archduke Eugene had some 20 divisions, including the Bavarian *Alpenkorps*, which had been sent to Tirol, although Germany and Italy were not yet at war. Boroević and Dankl were much weaker in infantry strength than the armies opposed to them. But they were strong in artillery, were very much better equipped with machine-guns, and held positions that were naturally ideal for defence and had been well prepared.

First and Second Battles of the Isonzo.—On June 23 began what is known as the first battle of the Isonzo. The II. Army, with a strength of 10 divisions and two Alpine groups, attacked the enemy lines in the Tolmino sector, and from Plava to Podgora, while the III. Army, with six divisions, moved to the assault of the western rim of the Carso plateau. The Itálians had not sufficient heavy artillery; Boroević had now nine divisions, with their march battalions, and further reserves were on the way. After very heavy fighting at Plava, where the earlier Italian advance had established a small bridge-head, at the Gorizia bridge-head (M. Sabotino and M. Podgora) and on the edge of the Carso the action was broken off on July 7. During the fortnight's fighting the Italians had gained a little ground at the cost of about 19,000 casualties. The Austrian casualties to date were 22,000.

After 10 days' breathing space Cadorna attacked again in the same sectors. Boroević had now 13 divisions under his command, but Cadorna had concentrated all his slender supply of heavy guns on the Isonzo front. No headway was made by the II. Army but a fierce struggle took place on the Carso. Monte San Michele was taken on July 20 but lost again, and six days later a fresh attack had the same result. The second battle of the Isonzo ended on Aug. 3 with the Italians close under the crest of Monte San Michele and the village San Martino del Carso, and in possession of most of Monte dei Sei Bus, farther south. The Italians lost some 34,000 men, but the Austrians also suffered severely and lost over 10,000 prisoners.

The Autumn Offensive, Oct.–Dec.—Various isolated actions were carried out on the long front during the summer, but the time was devoted chiefly to preparation for a big offensiv the autumn. By the middle of Oct. Cadorna could dispose 312 battalions on the Julian front. The II. Army now consis of 12 divisions and the III. of seven, while a reserve of five d sions lay ready in the Friuli plain. When the attack began Bo ević had about half this number of troops, but within a fortni he had the equivalent of 15 divisions at his disposal. It was the II. Army front that the Italian numerical superiority great; on the Carso the Duke of Aosta had no marked advant in numbers over the Archduke Joseph, who had assumed command in this sector in July. But the terrain on Boroev right was such that he could expect to hold with greatly infer forces, especially in view of the Italian weakness in artille The offensive went badly. By his main attack Cadorna h hoped to turn the Gorizia positions from both north and sou and as a secondary operation, after crossing the middle Isonzo, threaten Tolmino from the south, as well as from west and nor After a first phase lasting a week, the attack was renewed f days later on a narrower front, but the third battle of the Ison closed on Nov. 4 with little tangible result.

Six days later the fourth battle of the Isonzo was begun. a the struggle went on for more than three weeks, the offensi being finally broken off on Dec. 5. As men and munitions came exhausted the scope of the action had been gradually duced to an attack on the Gorizia bridge-head and still anoth struggle for Monte San Michele. Once more the artillery prov insufficient, and the main feature of the fighting was the her efforts of the infantry on both sides. During the two battl which were fought in persistent bad weather, the Italians l over 113,000 men and the Austrians about 90,000. The result the first seven months' campaigning was disappointing to tho who had hoped for far greater effects from Italy's interventio It was not generally recognised how poorly the Italian Arm was provided with the material necessary to modern war. I evitably, moreover, the Austrians had a great advantage in the nine months' war experience. They were clearly superior in sk to their opponents, and their superior skill was backed by spirit which the armies of the dual monarchy sometimes fail to show on the Eastern Front.

Preparations for 1916.—The winter months were busily en especially in the munition factories. It was beginning to gnised in Rome that estimates regarding numbers of men ells had to be revised. During the winter the small total y and medium guns was increased sevenfold, and great inadequate efforts were made to increase the supply of An important innovation of the winter was the *bombarda*, trench mortar, large numbers of which were constructed e up for the deficiency in heavy artillery. The *bombarda* fact much more than what is usually understood by the rench mortar. Its range was much longer, and the de- e power of its big projectile was very great.

supply of men, no less than that of material, required to be shed and augmented. In seven months the Italian losses field were close upon 280,000—66,090 killed, 190,400 d and 22,520 missing or prisoners. The Austrian losses ,000 killed, 97,000 wounded and 31,000 missing or prison- all 156,000. The Italian figure was in addition to casual- m sickness, which were heavy, including as they did the rom an outbreak of cholera in the II. Army. Men had to d not only to fill up the gaps but to make new formations. the winter the gaps were filled, and eight new divisions eady in the spring, while others were in process of forma- ad Cadorna had succeeded, after some difficulty, in having sses required for drafts called up well ahead of his imme- eeds.

BATTLES OF THE ISONZO AND THE CARSO

ng the early months of 1916 the only fighting of any im- ce took place in March, when Cadorna opened a big dem- ive action on the Julian front, with the object of preventing patch of Austrian forces to Verdun. The action contin- om March 11 to March 29, and received the name of the Battle of the Isonzo. Although it was only a demonstration, ard fighting took place, and both sides suffered consider- ss. Meanwhile, preparations for a real Italian offensive on lian front were well advanced, when news came that the ans were preparing a big attack in the Trentino.

rian Failure in the Trentino.—This attack, which is de- elsewhere (*see* ASIAGO, BATTLE OF) had a big initial suc- ut it was already condemned to failure when Brusilov, ing the appeal for co-operation made by Cadorna on May acked the weakened Austrian lines in front of him on June won the great victory that, if Cramon may be believed, ithin an ace of being decisive. The attack in the Trentino, on a miscalculation, nearly ended in the collapse of Aus- astern front, and brought only a slight territorial gain that compensation for the defeat elsewhere and for the losses d. Nor did the penalty end with these. Cadorna refrained nocking his head against the lines upon which his retreat- emy turned and stood. The positions he reached were ade- to his aims in the Trentino, which were purely defensive, nstead of persisting in his counter-offensive he rapidly his reserves back to the Julian front, smashed through the a bridge-head and took Gorizia, and drove the Austrians he western section of the Carso plateau.

Taking of Gorizia.—During the winter of 1915–6, in prep- n for an attack upon Gorizia and the Carso, the right of the II. Army had been transferred to the III., so that ont from north of Monte Sabotino down to the sea was the Duke of Aosta. At the end of July, when the delayed was imminent, the Duke had 16 divisions and a dis- ed cavalry division. He had 1,250 guns, of which 520 eavy or medium, and these were supplemented by nearly *mbarde.*

the Carso and about Gorizia Boroević was badly prepared et the Italian attack. He had only five divisions in line en Monte Sabotino and the sea, and one in immediate re- when the Duke launched his attack, and the Austrians aken by surprise. On Aug. 4 the Duke began with a feint t the low hills east of Monfalcone, and two days later the tack developed, when the VI. Corps attacked the Gorizia -head and the XI. the summits of Monte San Michele. The VI. Corps, commanded by Gen. Luigi Capello, had outgrown the dimensions of an army corps, for it consisted of no fewer than six divisions. Capello's attack was brilliantly successful. Monte Sabotino, which had resisted so many attempts at capture, was taken on the run in 40 min., while the greater part of the Podgora ridge was torn from the Austrians and some Italian detachments reached the river at sunset. The Austrians defended with the most obstinate valour, and gained precious time for their hard pressed commander.

Italian troops crossed the river on the night of Aug. 8, and the town of Gorizia was occupied next day without resistance, while a general attack on the Carso was breaking down the stubborn defence which had survived the loss of Monte San Michele early in the first days' fighting. On Aug. 10 the Austrians were driven back across the Vallone, the deep cut that separates the San Michele-Doberdo section of the Carso from the main plateau. Both to the east of Gorizia and on the far side of the Vallone the advancing Italians found themselves faced by new lines hidden among the woody slopes beyond the town and the stony undulations of the Carso. Attempts to continue the offensive were not successful. The sixth battle of the Isonzo was an important Italian success, but there was not sufficient weight of guns and ammunition to push the attack home.

Closing Operations of 1916.—In Sept., Oct. and again at the beginning of Nov. the Duke of Aosta attacked on the main Carso plateau, between the Vippacco and the Brestovizza valley, punching out a big salient on the northern half of the Carso, driving the Austrians back to their last line of trenches and occupying the important position of Dosso Fajti. But the seventh, eighth and ninth battles of the Isonzo were each broken off as soon as the attack slowed down. Cadorna was attempting to gain position for a bigger attack later on, when men, guns and shells should be more plentiful. Bad weather prevented another blow, and prevented also an attack in the Asiago uplands, which had been planned for the middle of November.

The year had seen much heavy fighting, and both sides had suffered severely. The Italian casualties were nearly 120,000 dead, 285,000 wounded and 78,000 prisoners, the bulk of the latter taken in the first days of the Austrian offensive in May. The Austrian losses were also heavy, well over 200,000 killed and wounded and some 60,000 prisoners. If the territorial gains at the end of the year's fighting were not great, Cadorna's continued attacks, following upon the costly failure of the Austrian offensive in the Trentino, had done their work in occupying an increasing number of the enemy's troops and wearing down his resistance. Cadorna's rôle was clearly marked out; so long as the plans of the Allies were based upon the policy of attrition, he had to hammer when he could, with what means he could collect from month to month as the output of guns and munitions increased and fresh troops were trained, keeping always in view as an essential aim that of attracting to his front, and wearing out, the maximum number of enemy forces. Judged from this standpoint, the Italian effort of 1916 was of the greatest value to the Allied cause.

Although Cadorna was strongly opposed to the dispersal of his forces in *petits paquets* and had resisted the suggestion of an expedition to Libya to quell the rising which had reduced the Italian occupation to a few points on the coast, the importance of the Balkan front had not been lost sight of by the Italian Government. Fresh troops were sent to strengthen the Italian position in Albania, and in Aug. a strong force arrived in Salonika under the command of Gen. Petitti di Roreto to take part in the Allied advance on Monastir. Early in Oct. an Italian column occupied Argyrokastron, and before Nov. the Italians were in touch with the left wing of the Allied forces based upon Salonika.

IV. THE AUSTRO-GERMAN EFFORT

At the Allied conference held in Rome in Jan. 1917 the formal proposal was made that an Allied force should join the armies of Italy in an attempt to smash the weaker of the two Central Powers. In spite of Mr. Lloyd George's advocacy the plan did not commend itself to the French and British military authorities; who offered, however, to send 300 heavy guns to Italy on condition that they were returned to the French front by the month of April. Cadorna declined the offer, on the ground that the season was unsuitable for an offensive on his front, and that the guns would have to be returned at the moment when they would be most useful. The question of closer co-operation was dropped for the time being, but the conference organised a line of communications through Italy to Salonika, via the southern Italian ports, a route which greatly lessened the dangers from submarine attack, and at the same time made a much smaller demand on the diminishing tonnage of the Allies.

Cadorna's Plan.—Cadorna embodied his proposals in a memorandum written after the Rome conference; they were as follows: If the Allies would give him at least 300 heavy guns he would make two attacks on the Trentino and Julian fronts—his own artillery was insufficient for this double offensive—and so find the enemy's weak point. He had the advantage of interior lines, and would move his reserves of guns and men from the Venetian plain according to the development of the two actions. If, on the other hand, the Allies would send a minimum of eight divisions in addition to the heavy guns, he would concentrate upon the Julian front and attack from Tolmino to the sea, with the object of breaking through towards Ljubljana (Laibach). Such an attack, in Cadorna's view, would have had decisive results. He believed that Austria could not recover from so severe a blow.

The plan was tempting, but it did not commend itself to the Allied commands. French and British opinion was against any further diversion of effort from the Western front, for there was the chief enemy, upon whose defeat the result of the war depended. And there were obvious technical difficulties in the way of supplying large French and British forces on the Julian front. Nivelle and Robertson, who visited the Italian front in the spring, agreed to the principle of direct co-operation by the dispatch of troops and guns in the event of necessity, but both were inclined to prefer co-operation by simultaneous attack, and while a scheme for the quick transport of troops from France to Italy was prepared, no definite engagements were taken. It was agreed, on the other hand, between Cadorna and Nivelle, that the Italian and French spring offensives should be timed to coincide as nearly as possible.

The Italian Spring Offensive.—Cadorna's attack was slightly delayed owing to a threat of an Austrian offensive in the Trentino, and later, by bad weather. But the Italian guns, which had been reinforced by 11 batteries of British 6-in. howitzers and 35 French heavy guns, opened fire on May 12. Cadorna feinted with the III. Army on the Carso, making his real attack with the II. Army, now under Gen. Luigi Capello, against the hills north and east of Gorizia. North of the town the greater part of the long ridge (Kuk-Vodice) running southward from above Plava was gallantly stormed and held against the most determined counter-attacks, but little progress was made east of the town. As soon as the occupation of the Kuk-Vodice ridge seemed assured Cadorna moved the bulk of his heavy guns southward and attacked with the III. Army on the Carso. Useful progress was made here also, a number of positions being captured, and the VII. Corps on the right carrying one line after another till they were half-way up Monte Hermada (Querceto). But ammunition was running very low; the offensive was broken off at a moment when it seemed as though further success lay very near. On the evening of May 26, when the attack on the Hermada was stopped, the defenders of the battered hill were reduced to under 100 men, each of whom received the Maria Theresa medal.

There was only a short breathing space. On June 4 the Austrians on the Carso counter-attacked in the most determined manner. Finding a weak resistance on the part of the troops who has come into line as reliefs, they freed the lower slopes of Monte Hermada, and took a large number of prisoners. During the four weeks' fighting Cadorna used 31 divisions and lost 132,000 killed and wounded and 25,000 prisoners. Boroević had held his ground, or nearly, with 17 divisions, and his losses, including 25,000 prisoners, were close upon 120,000.

The rumour of battle had scarcely ceased on the Julian
when the Italians attacked in force north of Asiago, on a
of nine miles. The attack failed. Progress was made at one
only, on Monte Ortigara, and here too, after a long and b
struggle, the attacking troops were thrown back. Between
10 and June 29 the Italians lost 24,000 killed and wounded
2,000 prisoners. The Austrian casualties were over 9,000.

Cadorna's Second Offensive, Aug.–Sept.—The general
tion at the end of June gave cause for disappointment and
anxiety. Russia was going out of action. The prospect
Entente victory with which the year had opened was cl
removed to a distance, and war weariness was making itsel
creasingly felt in Italy. The question of Allied co-operatio
the Italian front was once more discussed but without result
was decided that Cadorna should attack alone in August.
army was strung to the highest point of tension, awaiting
order to attack, when Pope Benedict XV. launched his ap
for peace. Parts of the army were shaken, for the Pope, in
impartiality, placed the two contending groups of Powers on
same level; he held out the hope that Germany and Austria
ready to consider certain territorial questions " in a concilia
spirit," taking into account " the aspirations of the peopl
and to the long and weary struggle he attached the label " us
slaughter." Some of the commands were anxious about
men when the attack began, on the night of Aug. 18.

As a matter of fact, the troops put aside their questioni
and the blow dealt to the Austrians was a very heavy one.
Isonzo was crossed in many places between Tolmino and P
and the greater part of the Bainsizza plateau was occupied
troops of the II. Army, while the southern end of the Chia
vano valley was passed and a footing obtained on the wes
corner of the Ternova plateau. But a long sustained
brought no further success. Cadorna intended to renew his
sive at the end of Sept. by an attack against the Ter
plateau, in the hope of definitely turning the Gorizia posi
from the north and cutting the main line of communications
tween the Austrian right and left. But towards the mid
the month news came of increased enemy forces and a pro
counter-offensive at an early date, and Cadorna, after t
stock, decided he must stand on the defensive. The four we
fighting in Aug. and Sept. had cost him over 16
men—40,000 killed, 108,000 wounded and over 18,000 pris
The toll taken by sickness had also been very heavy. The
were at low strength and the new drafts had not been sat
torily absorbed. A breathing space was urgently needed.

British and French Reinforcements.—The Austro-Germa
cess against the II. Army, the retreat of the Italian forces t
Piave, and the resistance in the new positions are desc
in a separate article (*see* CAPORETTO, BATTLE OF). When
gravity of the situation became clear, England and France
with all possible speed. The order was given for six French
five British divisions to entrain for Italy, and Foch and Ro
son hastened to the spot. An Allied conference at Rapallo
on Nov. 4, and from its discussions were born the Supreme
Council, which was to meet, once a month if possible, at
sailles, and the Versailles Military Council, which was to si
manently. It was agreed that the failure of the Italian ar
to resist the enemy attack called for a change in the Italian
mand, and Cadorna was appointed Italian military repres
tive at Versailles. He was succeeded by Gen. Armando D
commander of the XXIII. Army Corps, and the function
Gen. Porro, who was also relieved of his post, were divided
tween Gen. Giardino, who had been Minister of War during
summer, and Gen. Badoglio, commander of the XXVII. Co

V. THE COLLAPSE OF AUSTRIA

After the failure of Krauss and Conrad to break through
the Venetian plain, the Italian front saw no action of first
importance for nearly six months. The time was well occu
in reorganisation, but there were several minor combats.
German divisions left Italy at the beginning of 1918, in antici
tion of the great offensive which was being prepared on

n front. Gen. Plumer, who commanded the British forces,
t Italy to take up his old command. He had acquired a
opularity, and his departure was much regretted. Fortu-
he had a worthy successor in the Earl of Cavan. When
rman offensive in March 1918 pierced the line of the Brit-
Army four French and two British divisions were immedi-
ithdrawn from Italy. They were followed by the Italian
ps under Gen. Albricci. This left Diaz with 55 divisions
lian and five Allied) as against 60 freshly organised Aus-
ivisions, who were preparing for an early offensive.

ian Attacks Fail.—The original proposal of the Austrian
I staff, now under Gen. Arz von Straussenburg, was to
drive on both sides of the Brenta. Conrad, now in com-
in the Trentino, pressed for an attack in the Asiago up-
Krauss disapproved of both plans and urged an offensive
r sides of the Lake of Garda. Conrad's plan was chosen,
roević urged that this offensive should be accompanied by
ght drive by his armies across the Piave. This was agreed
both army groups attacked on June 15. Conrad attacked
cheuchenstuel's XI. Army from south of Asiago to Monte
a, while the Archduke Joseph attacked the Montello and
von Wurm crossed the lower Piave. Conrad had 27
ns at his disposal, and Boroević 23.

ad's attack was a complete failure. It went well to begin
ut at the end of the day all hope of success had gone, and
evening of June 16 he was finally beaten. Boroević, on
er hand, made good headway on the first two days, for the
ke Joseph took half the Montello, and Werzel von Wurm
shed an extensive bridge-head opposite San Donà di
But at the end of a week's fighting the Austrians were
held, and the order was given to retire across the Piave.
ilure was complete, and very costly. Conrad lost 36,000
nd Boroević over 60,000. The defeat broke forever the
ve power of the Austro-Hungarian Empire. The conscious-
impending disaster grew and spread through the mon-
and the troops were greatly disheartened by failure.

l Italian Offensive.—It was felt in many quarters that
hould have followed up the victory by a strong counter-
but he was unwilling to attack in force without careful
ation. He had had heavy casualties, over 40,000 killed
unded and a very large number of prisoners, and he pre-
caution. Plans were drawn up and preparations made for
nsive between the Vallarsa and the Brenta in September.
in Sept. Diaz went to Paris to discuss the situation.
s still pre-occupied in regard to his reserves, and asked
strong American force should be sent to Italy. This was
l, and in spite of criticism he delayed his offensive still
, while working out secretly a more ambitious scheme
was to be adopted if the chance should offer.

he middle of Sept. the victorious advance from Salo-
gan, and the chance seemed to have come.' 'On Sept. 25 or-
ere issued for a rapid concentration of troops, artillery
chnical services in the sector chosen for the attack, which
longer the plateau, but the Middle Piave." (Gen. Diaz's
). The attack (*see* Vittorio Veneto, Battle of) was
ed exactly a year after the disaster of Caporetto, and it
ed the armies of Austria-Hungary. Seldom in history has
t a disaster been followed by so complete a triumph. Yet
nal overwhelming success of Vittorio Veneto was not
greatest victory. The way to it was paved by greater
the wonderful recovery on the new line after the great re-
and the successful resistance against the last Austrian of-
that was the first ray of light to break upon those gloomy
s when the fortune of the Allies seemed at their lowest.
n the sum of Italian achievements be judged by the issue
e battles which were crowned with victory.

clusion.—Italy's contribution to the long effort that led to
umph of the Allies can only be gauged by a review of the
ign as a whole, by a realisation of the extent to which she
l the resources of Austria-Hungary, and of the price which
d. Her dead totalled 600,000; and 570,000 men were per-
tly disabled for military service by wounds or disease. For two and a half years the Italian armies were a constant threat to the Habsburg Empire and kept employed a number of divisions that increased from 20 to 40 (in the summer of 1917). During the last three months of 1917 the number of enemy divisions rose to 55, and in 1918 practically the whole effective strength of Austria-Hungary was arrayed against Italy, the number of divisions at one time approaching 70.

The figures speak plainly, and Ludendorff, in an interview published in the spring of 1919, placed among the chief causes of the German defeat "the lack of support from Austria, gripped ever more tightly at the throat by Italy." Cadorna rightly claimed that Italy's "grip on Austria's throat from 1915, compelling her to immobilise against us ever increasing forces, constituted the most notable result of our war, though it was little apparent to the eyes of civilians. It contributed largely to the victory of the Allied arms and to our final triumph."

(W. K. McC.)

ITALIAN LITERATURE (*see* 14.897).—The development of Italian literature, including philosophy and history, during the period 1910–26 was remarkable. Carducci and Verga mark the end of the stage during which Italians were finding themselves intellectually and politically. Pascoli, Fogazzaro, and D'Annunzio really belong to the new period which crystallised in the years immediately preceding the World War, and came to fruition in the social, political and spiritual revolution which followed it. These writers, together with Benedetto Croce and Giovanni Gentile, in the field of aesthetics and philosophy were largely responsible for widening the scope of intellectual activity and culture, so that they ceased to be narrowly Italian and became European.

The works produced in the first 25 years of the present century, and more particularly during 1910–25, are characterised by a spirit of daring, restlessness and youth; by intellectual curiosity, love of novel experiments and experiences, and above all by self-analysis, which, in some cases, led to egocentricity and decadence. Such defects, however, were due to the ebullience of youth seeking vent for its new-found energy rather than to weariness and to the search after sensations for their own sake. Writers aimed at the discovery of new forms of expression to supersede the old; thus, the Futurists were of service to the new literature, if only by reason of their attempt to break down inherited and stereotyped traditions in prose and verse. Prose underwent a remarkable change. It became crisper and at the same time more flexible, while language attained the unity long advocated by Manzoni.

Fresh interest was awakened in the most varied forms of criticism, in history, culture and philosophy of all times and in all countries. In this eclectic tendency Renato Serra, a young and promising critic who was killed in the War, saw the beginnings of a new form of classicism. Interest in foreign literatures, including those of the East as well as of the West, produced a vast library of translations varying in quality, but on the whole showing a marked tendency towards treating translation as an art. With the exception of Adolfo de Bosis' remarkable version of *The Cenci* (1916) and *Epipsychidion*, Carlo Linati's *Tragedie Irlandesi di W.B. Yeats* (1914), Raffaello Piccoli's *Drammi Elisabettiani* (1914) and Mario Praz's magnificent tour de force represented by his anthology of verse renderings *Poeti Inglesi dell' Ottocento* (1925), English literature found less translators than German, French or Russian, and contemporary writers, apart from Kipling, Shaw, Galsworthy and Barrie, are only available in the original. This cosmopolitan spirit acted as a stimulus to the growth of the new national literature rather than to imitation of foreign models. A further significant evidence of this new energy are the changes which have taken place in the publishing world, where the output has increased and the technical production improved as a direct result of the increase of the reading public of all classes.

Fiction.—Although strictly belonging to the preceding generation, Alfredo Oriani (1852–1909) and Carlo Dossi (1847–1910) did not receive due recognition until after their deaths. The former was obsessed by ugliness and horrors and at the same time had an intense love of beauty. The impartiality and variety of outlook was in part the reason for his popularity among the younger generation. And Dossi, by his harsh and elliptical style and his original and vivid treatment of his subject matter, unfashionable in his own day, opened out new paths to his successors. G. Pietro Lucini (1867–1914) is also of interest on account of his reaction to the various decadent European schools and as a forerunner of the Futurists who claimed him as one of themselves. Of an entirely different character is the work of Alfredo Panzini (b.1863) one of Carducci's best pupils. Possessing a quiet sense of humour tinged with irony, his attitude towards life is detached but not aloof. In what are generally considered to be his masterpieces *Le Fiabe della Virtu* (1905), *La Lanterna di Diogene* (1909), *Santippe* (1914) and *Viaggio di un Povero Letterato* (1919), Panzini is acutely sensitive to all forms of beauty and to the conflict between them and the evils and uglinesses of the world. He has the temperament of a poet; his style is pure, simple, direct and moving, the prose counterpart of Carducci's best lyrics.

Adolfo Albertazzi (b. 1865) learned the art of the short story from the Italian masters of the past and the modern writers of foreign countries. Some of those collected in the *Diavolo nell' Ampolla* (1918) and in other volumes are among the best of the kind published in modern times. It is worthy of notice that most of the novelists, dramatists and critics of to-day—men and women—have tried their hand at the short story of the magazine type. Of these Luciano Zuccoli (b. 1870), Virgilio Brocchi (b. 1876), Antonio Beltramelli (b. 1880), Guido da Verona (b. 1881) and Ugo Ojetti (b. 1871) who is also a very highly esteemed art connoisseur, and among the women writers Clarice Tartufari (b. 1868), Sibilla Aleramo (b. 1879), Neera (1846–1916), Amalia Guglielminetti (b. 1885) and Carola Prosperi (b. 1883) are the most popular. Generally speaking, most of these works are of value mainly as documents of social history rather than as literature.

The New School.—The younger novelists and story writers, though very numerous, shared a tendency to be egotistic, self-analytical and autobiographical, and cultivated a lyrical prose style. The lack of any national literary centre comparable with Paris or London has created regional groups united by geographical convenience, the individual members of which continued to follow, in part at least, the literary and intellectual tradition of their several provinces which, however, amounted to little more than impressionistic landscape-painting in words, as in the case of Carlo Linati, who in the finely written *Sulle Orme di Renzo* (1919) has given a poetical interpretation of the Lombard spirit as revealed in the countryside. The War practically destroyed narrow provincialism and successfully fused its best characteristics into a wider nationalism.

The great national and international reputation acquired by Croce and Gentile, both Neapolitans, the influence exerted on criticism by their review *La Critica*, founded in 1903, the fact that a considerable proportion of the best-known novelists and dramatists of the past 50 years (Capuana, Verga, Serao, Bracco, Pirandello) have been Southerners and, lastly, historical, geographical and racial conditions, have all contributed to produce a strong clan-feeling different from that of other regional groups. Of these the most important was perhaps the Florentine called "Gruppo della Voce," from the periodical of that name founded by Giovanni Papini and Giuseppe Prezzolini about 1909, itself the off-spring of an earlier review—*La Leonardo* (1903–7), which gave a great impulse to philosophical studies. Both periodicals had for their programme the revaluation of old values and the diffusion of new ideas in literature, art and philosophy. Scarcely one of the younger writers of any note did not contribute to one or the other of these reviews, which, in many cases, were the first to discover them. Not all of the contributors were of equal merit or free from any defects, but they showed the presence of a new
spirit and vitality much needed, and exerted an influence
reaching as it was important and often superior to their in
ual achievements. Papini (b. 1881), however, is the onl
who is at all known outside Italy mainly on account of the
advertised *Storia di Cristo* (1921), a work which has added
to a reputation really founded upon his autobiography, *Un*
Finito (1912), *Cento Pagine di Poesia* (1915), and the bril
provocative, and at times superficial critical essays *Stron*
(1916), Papini's encyclopaedic mind, ever in quest of new k
edge and intellectual experience, admirably typifies the
and virtues of the historical movement which came to an e
the outbreak of the World War. Papini, as the imposing bi
raphy of his works shows, has passed through many p
Pragmatism, Futurism and later Neo-Catholicism, always
serving a style, essentially Tuscan in character, at times
quial to the point of vulgarity, yet rich, vivid, lucid with a
tendency to rhetoric. Giuseppe Prezzolini also wrote some
lent critical essays, mostly on his contemporaries, but later
doned literature and philosophy for politics. Of the
principal contributors to *La Voce*, Scipio Slataper (1888–19
Triestino killed in the War, is best known for his notew
lyrical autobiography in prose, *Il Mio Carso* (1912) and a
gestive study on Ibsen published posthumously (1916).

Ardengo Soffici (b. 1879) is one of the most remarkable o
group. His best writings are a fragment of a novel, *Lemm*
Boreo (1912), two autobiographical journals, *Giornale di*
(1915) and *Kobilek, Giornale di Guerra* (1918), and the
criticism in *Il Caso Medardo Rosso e l'Impressionismo* (
and *Scoperte e Massacri* (1919). Soffici as a writer is both thou
ful and forceful and uses language impressionistically, freque
introducing exact and unexpected similes. The latter two w
did much to rouse the artistic youth of Italy to an intelli
appreciation of the significance of modern art movement
their insistence upon the necessity for the art-critic to be an a
(Soffici himself was a painter of some repute) and thorou
conversant with the technique of painting while possessing
capacity for feeling the values of form, colour and composi
Renato Serra, killed at the Front in 1915, was one of the
promising of the younger writers, who is best known for hi
markable psychological document, the *Esame di Coscienza*
Letterato, published in 1916, in which he examines the atti
of an artist and an intellectual towards the War with great
ness. The fact that some of it is mainly now of historical int
does not detract from its high literary value, which makes it
D'Annunzio's *La Leda senza Cigno* (1916–8) two of the very
works of art inspired in Italy by the War. Several other wri
such as Federigo Tozzi (1883–1920), Ferdinando Paolieri
1878), Bruno Cicognani (b. 1879) and Piero Jahier (b.
also have points of contact, in spirit and in style, with the
ence group. Several journalistic and literary coteries were
in Rome, such as that of *La Ronda* (1919), a short-lived but
periodical, edited by Emilio Cecchi (b. 1884). Among the
tributors were Antonio Baldini (b. 1889) and Riccardo Bac
(b. 1891). Since the advent of the Fascist Govt., however, R
is rapidly developing into the centre of Italian culture.

The Futurists.—It was very natural that the Futurist m
ment should have been started in Milan, since that city has al
taken the lead in any new intellectual movement, and in
present case, as the most modern and "mechanical" city
Italy, was peculiarly adapted to be its headquarters. It is
significant that after the World War it moved to Rome
an entirely new body of supporters, though still under the lea
ship of its founder, F. T. Marinetti (b. 1878). In the first Fu
ist manifesto published in 1909 in the Paris paper
Marinetti announced the new aesthetic of the machine, con
ered as symbol, source and teacher of a new artistic sensibil
and preached the beauty of speed. It was rapidly followed by
"Technical Manifesto of Futurist Literature" (1912), w
decreed that syntax should be replaced by "wireless imaginat
and words at liberty," and by others dealing with the thea
art, architecture and life. Apart from its sensationalism
self-advertisement and its principles of destructiveness, Futur

he less acted as an irritant and forced writers, and particu- oets, to react against stagnation and to define poetry anew, e difference between it and prose. Of the many books pub- by the first generation of Futurists some, like Filippo aso Marinetti's (b. 1878) extraordinary novel *Mafarka le ste* (1910), *Le Roi Bombance* (1910), a play, written origi- n French, and *Zang-Tumb-Tumb* or *The Siege of Adrianople* —an experiment in "free-words"—are among the curios- f literature. On the other hand, Palazzeschi's (b. 1885) ully grotesque tale, *Il Codice di Perela* (1911), and the vol- f free verse *L'Incendiario* (1910), Luciano Folgore's (b. *Canto dei Motori Versi liberi* (1912) and a few of Mari- earlier poems practically sum up the best literary ts of the movement.

Poets.—Carducci, Pascoli and D'Annunzio have had a number of followers and imitators, but either through f inspiration and technical ability or because fiction offered e profitable market none have produced anything of defi- nportance excepting Salvatore di Giacomo (b. 1860). He ritten some of the finest dialect poetry in Italian literature ed, like most of his other work, by the life of the Neapolitan ace. The poignant "Tarantella scura," the dramatic son- quence "A San Francisco," and the very beautiful song chie de suonno," republished in *Poesie* (1907), possess the rsal quality of true poetry, which is sometimes found also ew of Pascarella's and Trilussa's poems in Roman dialect. e others, Guido Gozzano (1883–1916), Marino Moretti 85), Enrico Pea (b. 1881), Amalia Guglielminetti (b. 1889) evidence at first of technical skill and lyrical vein which has degenerated into affectation and mannerisms. As the very anthology, *Poeti d'Oggi: 1900–1920* (1920), edited by i and Pancrazi paradoxically yet conclusively proves, those rite poetry to-day choose to do so by using prose instead of for their medium. In this sense many of the writers dealt above may justly be considered poets.

Drama.—There have been since D'Annunzio some suc- l attempts at poetic drama such as Benelli's historical lies *Maschera di Bruto* (1909) and *Cena delle Beffe* (1909), n in effective blank verse, Ettore Moschino's *Tristano e* (1910), Enrico Butti's fanciful *Castello del Sogno* (1910), E. L. Morselli's (1882–1921) *Orione* (1910) and *Glauco*). The latter of these are written in lyrical prose and are by e best productions of this type of drama. Some of the other rights like Dario Nicodemi have portrayed, with varying y, society life, according to the formula derived from the h dramatists. Others, following the realistic tradition of ana, Verga and Giacinto Gallina, have written light come- r dramas in dialect or local vernacular. Many of these are charming and well constructed, especially the Florentine *L'Acqua Cheta* (1908) by Augusto Novelli and *I' Pateracchio*) by F. Paolieri. Some notable plays of the grand-guignol have been written in Neapolitan dialect by Salvatore di mo, *Assunta Spina* and *O' Mese Mariano* (1910), Ernesto lo and Roberto Bracco, and, in Sicilian, by Pirandello à, 1917). The fame of Roberto Bracco as a dramatist however, on *Piccola Fonte* (1905) and *Piccolo Santo* (1912), latter being one of the masterpieces of modern Italian atic literature. Most of his plays present psychological and ual tragedies with hardly any external action, and are pro- cedly feminist in sympathies. Technically, they are remark- for austere simplicity of construction and lack of any nal appeal to the emotions.

e essential difference between Bracco and Pirandello is that s intellectual, the other cerebral. In Pirandello (*q.v.*) the atic form is a natural step from the novel and the short es, in which the characters are, *dramatis personae* always talk- mong themselves but unable to make each understood to ther, until they begin to doubt whether they really exist and ot shadowy forms conjured up by the imagination of those g whom they live and by which they are bound. The dra- c situations arise out of the contrast between what the in- ual is, what he conceives himself to be and what others think him. What is reality, if indeed there be such a thing, and what is unreality? Is there a dividing line between madness and sanity? Can life have a meaning outside the ever-changing, and arbitrary value attached to it by an individual? These are the problems which constantly reappear in his fiction and in his plays—the logical, if extreme, outcome of the introspective and psycho-analytical tendencies of his period. Pirandello has revealed his sense of theatrical technique but his situations are the result of logic rather than of ingenuity. He is responsible for introducing a new prose style, clear-cut, dry and nervous on the stage, a considerable achievement which may have far-reaching effects on his successors.

Next to Pirandello, Rosso di San Secondo (b. 1887), a Sicilian known also for his short stories, and Federico Valerio Ratti, author of a remarkable tragedy on Judas Iscariot, are the most promising dramatists. The work of the former has as its dominant motif the contrast of Life governed by discipline as opposed to impulse, symbolised respectively by the North and the South. The characters of *Marionette, che Passione!* (1918), *La Bella Addormentata* (1919), which he describes as a "painted adventure," and *Lazzerina fra i Coltelli*, his most recent and abstract work, are allegorical and poetical, and achieve a certain original and dramatic effectiveness. Luigi Chiarelli's play, *La Maschera e il Volto* (1917), presents in light comedy form many of Pirandello's ideas. Its success, perhaps, was due to the label of "grotesque" which he gave it and subsequently adopted loosely to denote plays of a similar genre such as Luigi Antonelli's *L'Uomo che incontro se stesso* (1919), Fausto Maria Martini's *Fiore sotto gli Occhi* (1922), and Cantoni-Gibertini's *Fantoccio*; other experiments were encouraged more by the desire to appear original than by dramatic ability.

Criticism.—Towards the beginning of the 20th century critical theories underwent a considerable change. This was due to the general reaction against positivism and materialism in favour of idealism, which found its most eminent supporter in Benedetto Croce (*q.v.*) Many have applied these principles, and even those who disagree with them have felt their influence. Croce has further made some notable contributions to the history of Naples, not counting those to philosophy. In this respect Gentile shares with Croce the right to be treated as one of the most important philosophical thinkers of the present day and as a critic. Among the older idealist—though not Crocean—critics, Arturo Farinelli, author of *Il Romanticismo in Germania* (1911), *Michelangelo e Dante* (1918), and several other valuable works; Cesare de Lollis, and Alfredo Galletti, who succeeded Pascoli in the chair of Italian literature at the University of Bologna and to whom he had devoted a very brilliant and profound critical study, are the most important.

To these three university professors all of whom combined wideness of literary sympathies and knowledge with uncommon critical abilities, should be added the name of a younger man—G. Toffanin—who at the time of writing has already given several proofs of originality, talent and scholarship of a very high order. The work of the militant critics is represented among other works by Thovez's essays *Il Pastore il Gregge e la Zampogna* (1910) and *Mimi dei Moderno* (1919); by Renato Serra's *Scritti Critici* (1910), and *Le Lettere* (1914), a brilliant survey of contemporary literature and its characteristics, as well as by the critical writings of Papini and G. A. Borgese (b. 1882) who, besides the *Storia della Critica Romantica in Italia* (1903) has also written *Rubè* (1921) an interesting autobiographical novel. In some ways their views are often paradoxical and exaggerated, but they possess, however, the frank enthusiasm and charm of youth added to knowledge and aesthetic appreciation.

(A. DEL R.)

ITALO-TURKISH WAR.—Following the diplomatic discussions which took place between Rome and Constantinople during the summer of 1911, an ultimatum from Italy was delivered to the Porte on Sept. 28, demanding Turkey's consent to a military occupation of Tripolitania and Cyrenaica. A period of 24 hours was set by the ultimatum, and as the Turkish reply did not meet the Italian demands a state of war was declared as from 2:30 P.M. on Sept. 29.

Italian Naval Activity.—Military action was slow to succeed the formal declaration of war, and it was not till Oct. 11 that the first transports reached Tripoli. Meanwhile the Italian navy had been busy. On Sept. 28 a squadron appeared off Tripoli, and notice was given that if the town were not surrendered it would be bombarded. The obsolete fortifications were bombarded for two hours on Oct. 3, after the Turkish authorities had declined to surrender the town. By next day, the Turkish garrison, acting upon orders received from Constantinople, had retired into the sandy plains, and on Oct. 5 a force of 1,600 sailors was disembarked.

Meanwhile hostilities had been begun elsewhere. On Sept. 29 and 30 Italian destroyers under the command of the Duke of the Abruzzi sank the Turkish torpedo-boats off Prevesa in Epirus and on Oct. 1 Admiral Aubry left Augusta to go in search of the Turkish fleet, which the declaration of war had found at Beirut. But the orders given him were suddenly countermanded, and instead of steaming to the Aegean in order to intercept the Turks, he was sent to Tobruk, which was occupied by a detachment of sailors on Oct. 4.

The renunciation of the attempt to cut off the Turkish fleet was inspired by political reasons. The Italian Govt. believed that the Porte would soon realise that it was impossible to defend the Tripolitan provinces, and would be willing to enter into some arrangement that would satisfy Italian aspirations and save the face of Turkey. Another reason was the desirability of localising the conflict. Other European Powers were not willing that hostilities should be extended, and the other members of the Triple Alliance were particularly energetic in their disapproval.

Italian Expeditionary Force.—A week elapsed between the landing of the sailors at Tripoli and the arrival of the expeditionary force, and it was not till Oct. 20 that all the equipment had been put on shore. The force consisted of some 9,000 rifles with a few field and mountain batteries and two squadrons of cavalry. There was very little transport, for it had not been anticipated that the Turks would retreat towards the interior and receive support from the native tribesmen. That Neshat Bey, the Turkish commander in Tripoli, did receive this support was largely due to two men—Ferhat Bey, deputy for Tripoli and Suleiman el Baruni, a Berber from Fessato, who was deputy for the Jebel region.

Meanwhile Homs, Derna and Benghazi had been occupied. There was some resistance at each place, especially at Benghazi, but the first fighting of any importance was a sudden attack on Oct. 23 upon the Italian lines at Shara Shat in the Tripoli oasis, backed by a rising behind the lines. Two companies of Bersaglieri were cut to pieces, and the rest of the regiment were hard put to it to hold their own. Further attacks led to a withdrawal of the line, and to the clearing of the oasis behind the trenches.

Large reinforcements were sent from Italy, and by the fourth week in Nov. Gen. Caneva, who was in command of the expedition, had about 25,000 rifles and 16 batteries. He took the offensive, and in two actions cleared the oasis and sent the Turks and their tribesmen allies packing. Turkish headquarters were established at Aziziya, some 30 m. south of Tripoli.

Political Aspect.—At the beginning of Nov. the Italian Govt. had considered the possibility of extending the theatre of war, on the sea at least, in the hope of inducing Turkey to give up the struggle. Austro-Hungary intervened, backed by Germany, invoking Article VII. of the Triple Alliance. Italy's action being limited in this way, it was necessary to solve the problem directly, but the task was more difficult than it need have been owing to the limitations laid upon Gen. Caneva by the Italian Government. Gen. Caneva's orders appear to have been that he must not risk reverses or suffer heavy loss. I circumstances, an expedition in pursuit of the Turks and mobile allies seemed hardly practical.

In any event, months went by without any action of im tance in Tripolitania. In Cyrenaica there was one fight Benghazi, when a force of Arabs who had come near the were attacked and severely punished. Derna was closely throughout the winter, and Enver Bey, who had succeede reaching Cyrenaica towards the end of the year, organise formidable resistance, securing relative unity among the tri men, and a willingness to co-operate with the Turks, which never before existed.

Italian Offensive Renewed.—In April, the long spell of i tion in the western province came to an end, and from that onward the resistance of the Turks and Arabs was gradu broken by a series of operations at various points.

In April, also, Italian warships appeared off the entranc the Dardanelles. They were fired on by the Turkish forts their answer drew a fresh and very energetic protest from Vie The northern Aegean was left alone by the Italians hencefo but in May the island of Rhodes and 12 small islands of Sporades (subsequently famous as the Dodecanese) were c pied by Italy. During the summer there were a number of cessful actions in Tripolitania, and peace negotiations begun at Ouchy in August. Progress was very slow, and it not until Oct. 15, when two important victories had been by the Italians, at Derna and Sidi Bilal (near Zanzur) that Treaty of Ouchy was signed.

Conclusions.—The conduct of the Tripoli campaign was pre diced, first, by the failure of the Italian Govt. to judge the sit tion correctly, and secondly, by the limitations which were upon the military command. It was not possible at once launch a desert expedition, and the difficulties of an advance the Jebel, through country largely waterless, may be said justify the adoption of a less ambitious plan. What is difficu understand is the practical veto upon action of any kind, w immobilised large forces from Dec. till April and dela the carrying out of the policy which eventually put an end hostilities, the policy of extending the area of operations a striking a blow whenever the chance offered.

The operations of the summer changed the situation, but It ian prestige was not wholly restored by the later successes, o the subsequent actions against the tribesmen who did not down their arms when the treaty was signed. The policy of t Government bore heavily upon the army, which came in much unfair criticism and increased the difficulties of those w undertook the administration of the country after the pea The troubles which were to come with the outbreak of the Wo War may be traced in part at least to the hesitations and unce tainties of the six months following the landing.

ITALY (*see* 15.1).—A country of Southern Europe and a mem ber of the League of Nations. Because of additions to th territory of Italy under the peace treaties (*see* St. Germa Treaty of and Trianon, Treaty of) the area of the countr was increased by 9,005 sq. m. to a total of 119,624 square mile The census of 1921 gave a total population of 38,755,576. Th population of the new territories at the date of the census wa Trento Venezia Tridentina 641,747; Fiume, Pola, Trieste an Zara (together constituting Venezia Giulia) 728,544; making total access of population of 1,370,291.

I. POLITICAL HISTORY

The Giolitti Government.—On the resignation of the Luzza Cabinet (March 18 1911), Sig. Giolitti formed a governme During the previous few years relations with Turkey had b come strained owing to the restrictions placed by the Porte o Italian enterprise in Tripoli, the only part of North Africa whe n expansion was still possible. At the same time the policy rmany aroused the suspicion that she was contemplating n in that province. The Nationalist movement, created at lorence Congress of 1910, and directed towards awakening ountry to the necessity of a more vigorous foreign policy, ated the occupation of Tripoli. The success was such that ti himself, anxious as he was to avoid foreign complica- could not afford to disregard it.

er a series of diplomatic incidents, an ultimatum was pre- d to Turkey on Sept. 28 1911, and no satisfactory answer obtained, war was declared on the 29th. Except for the lists, public opinion strongly supported the government, ding the war not merely as a colonial enterprise, but as a tic reaction against the old pusillanimous policy and the intrigues of Parliament. On Nov. 5 Italian sovereignty xtended to Tripolitania and Cyrenaica. Foreign Powers not friendly to Italy's African policy, and while Austria d a veto on the extension of the campaign to the Balkans, a s diplomatic incident arose with France over the searching talian cruisers of the French steamers "Carthage" and nouba," suspected of carrying contraband. Although the was satisfactorily settled at The Hague, it did not im- e Italo-French relations. On Oct. 15 1912 the peace pre- aries were signed at Ouchy, and the treaty on the 18th, the n retaining only spiritual authority over the inhabitants e annexed territories, Italy remaining in occupation of les and the Dodecanese until Turkey had withdrawn all roops from Libya and fulfilled her other treaty undertakings. total cost of the campaign had been 458 million lire. Fight- owever, did not end immediately, as the Arabs, secretly orted by Turkey, continued to resist in the interior.

g. Giolitti's proposals for the extension of the franchise ng the electorate from three to eight million voters), pay- of members and a government monopoly of life insurance voted without much opposition, as Parliament did not wish nbarrass the Cabinet during the War. At the Socialist con- of Reggio Emilia (June 1912) a group of leaders, including ida Bissolati and Ivanoe Bonomi, who approved of the rnment's African policy, were expelled from the party and ed a new group called the Reformist Socialists, prepared to borate with the Constitutional parties. The majority styled thenceforth the "Official" Socialist party. In the field of r there were strikes at the Fiat works in Turin, and among gricultural workers of Ferrara and a general strike at Milan e summer of 1913.

uring the Balkan Wars of 1912–3 Italy and Austria had agreed e creation of an independent Albanian state, thereby ex- ing the Serbs from Durazzo and the Greeks from Valona. ite of this settlement and of the Marquis di San Giuliano's mpts to arrive at a friendly understanding with Austria, ions were strained to breaking-point by Austria's treatment r Italian-speaking subjects and the menaces of the Austrian ary party against Italy.

t the elections of Oct. 26–Nov. 2 1913, under the extended chise, the Socialist group was increased to 79. For the first a Catholic party presented itself to the polls, the Pope hav- withdrawn the *non expedit*, and 33 Catholics were returned, e a number of Liberals and Democrats owed their success to olic support. Sig. Giolitti's position was somewhat shaken, although the Socialists were ready to give him tacit support xchange for concessions to their co-operative societies and ain measures of a demagogic character, disagreement among wn followers over the question of Catholic support, and the atened railway strike were likely to cause trouble. On March 914 he resigned and was succeeded by Antonio Salandra, a t-wing Liberal of high standing. San Giuliano remained at Foreign Office, but Gen. Spingardi was succeeded as War ister by Gen. Grandi. The revolutionary *Sindacato ferro-* now demanded a general increase of wages, but, owing to cial difficulties, the government could offer an increase to the lowest categories; the *Sindacato* threatened a strike, eventually gave way.

On the national festival of the Statuto (June 7 1914) riots broke out at Ancona because the authorities had forbidden the holding of an anti-militarist meeting. A general strike ensued in the town and the trouble spread to other parts of the Marche, to Romagna, and most of the larger cities. The movement was of a mainly revolutionary character; its leader was the Anarchist Enrico Malatesta, and Benito Mussolini (*q.v.*), editor of the *Avanti*, played a prominent part in it. For a week many towns were under mob rule, until a popular reaction led by the Nationalists cleared the streets of the seditious elements and the troops and police restored order. Sig. Salandra was criticised for his lack of energy in dealing with the outbreak, while the Socialists attacked him for his "reactionary" methods; a group of Giolittian deputies, headed by Orlando and Schanzer, tried to bring about his fall, but he secured a vote of confidence.

THE WORLD WAR AND THE PEACE

The Austrian ultimatum was presented to Serbia on July 23 1914. Italy co-operated with Great Britain in trying to avert a catastrophe, and public opinion, although realising that if a *casus foederis* under the terms of the Triple Alliance were to arise, Italy would be bound to stand by her Allies, was hostile to the idea of siding with Austria. General relief was caused by Italy's declaration of neutrality on Aug. 3 which was based on (1) Austria's failure to co-ordinate with Italy before taking action, (2) the fact that Italy had not been given time to act in favour of peace, or to make adequate military preparations and (3) the fact that Italy was not bound by the terms of the Alliance to take part in an aggressive policy. It was afterwards announced that no *casus foederis* could arise for Italy in a conflict in which Great Britain was involved.[1]

Neutrality declared, military preparations began. The reorganisation and re-arming of the whole army was largely the work of the new Chief of the General Staff, Gen. Luigi Cadorna (*q.v.*). The question now was whether Italy should remain neutral to the end of the War. The Triplicists, although fairly numerous in Conservative and diplomatic circles, and in a part of the army, hardly went so far as to advocate intervention on the side of the Central Powers, for the invasion of Belgium had created a very unfavourable impression, but they advocated neutrality. The Catholics were neutralists from dislike of "atheist" France and Orthodox Russia and from sympathy with Catholic Austria. The "Official" Socialists were neutralists because they opposed all war except class-war, but ended by openly espousing the Austro-German cause. The Nationalists, Irredentists and some Liberals, realising that this was the last chance for completing Italian unity and affirming Italy's position as a Great Power, favoured intervention, while the Democrats, Freemasons, Republicans and Reformist Socialists were interventionists from sympathy with France. Mussolini's little group of Syndicalists desired intervention, partly for the same reason as the Nationalists, but also in the hope that war would promote social changes. Mussolini resigned the editorship of the *Avanti!* and founded a new paper, *Il Popolo d'Italia*, which supported intervention.

On Oct. 9 1914 Gen. Grandi resigned on account of a disagreement with Gen. Cadorna, and was succeeded by Gen. Zupelli. A week later the Marquis di San Giuliano died, and the Prime Minister temporarily took over the Foreign Office. On Oct. 31 the Treasury Minister Rubini resigned on a question concerning the supply of funds for the army, and the Cabinet followed suit. But Sig. Salandra himself reconstructed it by Nov. 5, and selected Baron Sonnino as Foreign Minister. Owing to the troubles in Albania, the departure of Prince William of Wied and the Greek invasion of the southern districts, Italy occupied the islet of Saseno on Oct. 31, and on Dec. 26 the town and harbour of Valona. 1915 began with a serious earthquake in the Abruzzi (Jan. 13), which caused the death of 30,000 people.

The Treaty of London.—Meanwhile the interventionist tendency grew stronger. Both Salandra and Sonnino were determined not to let the War end without trying to acquire at least a part of the Italian districts of Austria, and to secure a rectification of the frontiers of 1866 which left Italy open to invasion. In Dec. 1914 Italy had reminded Austria that the invasion of Serbia, by tending to destroy the balance of power in the Balkans, gave Italy a right to compensation under the terms of Article 7 of the Alliance as renewed in 1887. Austria began by rejecting the claim, then suggested compensation at the expense of France, and finally offered a part of the Trentino to be ceded after the War, but Sonnino insisted on immediate cession, and to this Austria at last agreed. Sonnino demanded all the Trentino, the Isonzo valley, some of the Dalmatian islands, a free hand in Albania and the formation of Trieste and Northwestern Istria into an independent state, Italy in return to remain neutral to the end of the War. As Austria continued to give evasive replies, Italy opened negotiations with the Entente. On April 26 1915 the Treaty of London was concluded between Italy, Britain, France and Russia, to be completed by naval and military conventions. Italy undertook to intervene, and was promised the Trentino and Upper Adige valley to the Brenner pass, Trieste, Gorizia-Gradisca, Istria and the Istrian islands, Cherso and Lussin, Dalmatia as far as Cape Planka, Valona, full possession of Rhodes and the Dodecanese and in Asia Minor a zone of influence and eventually a share in its partition. If an independent Albania were created, it would be under Italian control, while Italy would not oppose the cession of the northern and southern districts to Serbia and Greece if the other signator so desired.

---

[1] See EUROPE. The treaty of 1882 stated that "the treaty was not in any case directed against England."

The poet D'Annunzio by his fiery speeches, and Mussolini by his articles, largely influenced public opinion in favour of intervention. On May 3 1915 Italy denounced the alliance with Austria, but Prince von Bülow made a last effort to secure Italian neutrality through Giolitti. That statesman believed in the necessity for neutrality, as he had no confidence in Italy's powers of resistance, and, although informed by Salandra of Italy's engagements with the Entente, he continued his neutralist activities in collaboration with von Bülow. Salandra, knowing that if Giolitti declared his opposition, the Cabinet must fall, resigned on May 13. It seemed as though Giolitti's triumph were assured, but the voice of the country then made itself heard. Huge popular demonstrations in favour of Salandra and intervention were made all over Italy, and the King refused Salandra's resignation; Austria's final offer, no improvement on the last, communicated by Von Bülow to Giolitti before being communicated to the government, was rejected.

Italy Enters the War.—On May 20 1915 the Chamber and the Senate granted the Government full powers. Neutralism and Germanophilism had apparently disappeared, except among the Official Socialists. On the 23rd the general mobilisation was ordered, and on the 24th war against Austria was declared, while diplomatic relations with Germany were broken off. Owing to the persecution of Italian subjects in Turkey and Turkish assistance to the rebels in Libya, where Italian occupation was reduced to Tripoli and Homs and a port of Cyrenaica, War was declared against the Porte on Aug. 21, and against Bulgaria in September. On Dec. 1 Baron Sonnino adhered to the London Agreement, undertaking not to conclude a separate peace. An expeditionary force was sent to Albania, where it saved the remnants of the Serbian Army driven from its own country.

The initial successes of the Italian offensive were satisfactory, but did not lead to definite results. The subsequent defeats sustained in the Trentino and on the Asiago plateau (May 1916) shook the Cabinet's position, and on June 10 Sig. Salandra resigned. The Giolittians regarded this as a victory of theirs, but the new Cabinet was in no wise Giolittian. Sig. Paolo Boselli, the veteran statesman, respected by all parties, formed a Cabinet in which all shades of opinion, except the Socialists and Neutralists, were represented. Sonnino remained at the Foreign Office, while Orlando was transferred from the Ministry of Justice to that of the Interior.

The Austrian Trentino offensive had delayed Gen. Cadorna's attack on Gorizia, but this was now resumed, and on Aug. 4 1916 after 11 days' desperate fighting, the fortress fell and public confidence was thereby restored. That same month an expeditionary force was sent to Macedonia where it played a disti guished part in the Eastern operations. On Aug. 27 Italy c clared war on Germany, owing to the assistance she had afford to Austria and the seizure of Italian property by the Imper Government. In April 1917 the British, Italian and French P miers concluded a convention at St. Jean de Maurienne where it was agreed that in a future partition of Anatolia the Smyr area was to be assigned to Italy.

During the operations of 1916 and 1917 the Italians achiev some important successes, and above all pinned down Austria best troops, preventing her from sending reinforcements to t West. But the protracted struggle, the fearful losses, the co lapse of Russia, and the grave privations at home had acce tuated the feeling of depression in Italy, to which enemy an neutralist propaganda contributed. The Socialists fomented th discontent. Claudio Treves's phrase, "next Winter not a ma in the trenches," the German peace offensive, the Pope's all sion to "the useless carnage" and the defeatist campaign of th Giolittians began to affect public opinion and the war-wear troops. There were revolutionary riots in Turin (Aug. 191 and signs of a diminished military spirit among certain units the front. Gen. Cadorna had repeatedly warned the go ernment, and particularly the Minister of the Interior, Orland but no attention was paid to him. This state of affairs and ce tain military errors of Generals Cadorna, Capello, Badoglio an others resulted in the Caporetto disaster (Oct. 23 1917).

The Recovery.—After a defeat of these proportions it appeare impossible that the army and people could recover. But by No 22 the army had reconstituted its front on the Asiago-Grappa Piave line, and the enemy's advance was definitely held up British and French forces hurried to assist Italy, but did no come into action till December. Cadorna was relieved of h command and succeeded by Gen. Diaz. At the Rapallo inte Allied conference on Nov. 4 the Military Committee of Versaill was formed. In consequence of the Caporetto disaster the Bosel Cabinet resigned (Oct. 26), and on the 30th Sig. Orlando su ceeded, he himself becoming Prime Minister, Sonnino remaine at the Foreign Office and Nitti became Treasury Minister. Th necessity for relieving the refugees from the invaded area was serious problem, but it was efficiently handled, and the sight o the refugees helped to strengthen the spirit of resistance. Th army was rapidly reorganised and the losses in material mad good through the enterprise of the Italian manufacturers and th technical genius of Gen. Dalollio, Minister of Munitions.

On Jan. 8 1918 President Wilson published his famous Four teen Points. Those referring to Italy—"the rectification of th Italian frontiers on clearly recognised national lines," and "au tonomy" for the peoples of Austria-Hungary—were of a natur to raise anxiety as to his intentions. From April 8 to 10 the con gress of nationalities oppressed by Austria met in Rome, an although organised by a private committee, its delegates wer received by Orlando, to whom they presented the so-called "Pac of Rome," this should have been an earnest of mutual good-wil between Italy and the Yugoslavs, but it had no binding forc and compromised the solution of the territorial problems involved. Meanwhile the Yugoslavs were conducting a propa ganda to induce Britain and France to rescind the objectionabl clauses of the London Treaty, and even proposed that, shoul Italy remain obdurate, the Allies and America should cut of her supplies of food and fuel, a request which was rejected. Th economic situation was becoming worse, but Italy submitte to privations greater than those of any other Allied country. The shipping losses were serious, the bread ration was reduced to 250 grammes per head per day, meat was sold only twice a week, and many goods were unobtainable.

In June 1918 the Austrians launched a powerful new offensive on the Asiago-Piave front, but after a few initial successes, were driven back with heavy losses. The Italian contingent in Mace donia, commanded by Gen. Mombelli, contributed mate rially to the victory in the Balkans (Sept. 15–29). On Oct 24 Diaz launched his attack on the Austrians from Asiago to the sea, and by Nov. 3 "what had been one of the most powerful

; in the world," as the victory communiqué stated, " was
lated." Some 600,000 prisoners, 7,000 guns and immense
ities of material were captured. The same day at Villa
near Padua the armistice between the Italian and
-Hungarian armies was signed, the enemy under-
to evacuate all the territories assigned to Italy by the
n Treaty. The Armistice came into force on Nov. 4, fol-
a week later by that with Germany; to the latter's col-
the Italian victory had contributed, as it had opened the
nto the heart of Germany. The whole area within the Ar-
e line was rapidly occupied, as well as certain points be-
t for the maintenance of order. Italy's losses had amounted
l over 600,000 killed and a million seriously wounded, in-
g 220,000 permanently disabled. The knowledge of these
created a deep impression in Italy, but it was felt that they
ot adequately appreciated in Allied countries.

Peace Conference.—On Feb. 7 1919 the Italian Govt. pre-
a memorandum to the Peace Conference, embodying and
ing its territorial claims, which corresponded to those
l upon in London, but Fiume was also mentioned, because
t. 31 1918 the National Council of that town had, in the
of the Italian majority, applied for annexation to Italy.
were no difficulties about the Trentino as its population
wholly Italian. The Alto Adige contained a German-
ing population, but it would have been difficult to devise a
ctory frontier south of the Brenner. In the Venezia Giulia
half the population was Italian, but many of the Slavs
een recently imported by Austria to swell the non-Italian
tage; of the natives the majority were Italian, including
more civilised inhabitants. In Dalmatia the great major-
s Slav, but the civilisation and traditions of the province
Italian. Italian public opinion was unanimous in desiring
sfactory frontier and the protection of the *Italianità* of the
n communities east of the Adriatic, but was divided as to
etails of the settlement. The Nationalists demanded the
y of London territories plus Fiume. The *rinunciatari* were
to give up Dalmatia, part of Istria and the Trieste hinter-
because they wanted to conciliate the Yugoslavs and disre-
d strategic necessities, but demanded Fiume. Sig. Bissolati,
ter without portfolio, wished even to renounce the
Adige. In the Italian Peace Delegation too, opinion was
d; while Sonnino stuck to the Treaty of London and did
sist on Fiume, Orlando demanded the latter, but was pre-
to compromise on Dalmatia. The Yugoslav counter-
s extended to the old Italo-Austrian frontier and even
d it, and this attitude aroused much indignation in Italy,
ore so as, until the very eve of Austria's collapse, the Croats
Slovenes had behaved as faithful subjects of the Dual
rchy and had fought in the war against Italy, whereas
hey made their claims posing as Allies, and were treated as
by British, French and American statesmen.

e Government had many internal difficulties to contend
The army could not yet be demobilised owing to the un-
d conditions on the frontiers and the necessity for keeping
s in Albania, Bulgaria, etc. In Italy itself the Socialists and
munists, now that the war régime and the censorship were
ed, took advantage of the general weariness of the people to
nt revolutionary agitation, hoping to emulate their com-
in Russia. The financial situation was serious and Sig.
's budget statement for 1917–8, presented on Nov. 2 1918,
ed a deficit of 6,271 millions. Sig. Bissolati, disagreeing
his colleagues over the Alto Adige and Dalmatia, resigned.
n. 1 1919 the state of war was declared at an end throughout
, except in the Veneto. On the 3rd, President Wilson ar-
in Rome and was received with frenzied enthusiasm as the
who had contributed the most to end the War, but the
sters who discussed politics with him suspected him of little
athy with the more extreme Italian aspirations.

e Adriatic Question.—The ministerial crisis initiated by
lati's resignation came to a head on Jan. 18, and resulted in
esignation of Nitti, who wished to prepare the way for
ning the premiership himself, and of four other ministers. The Italian Peace Delegation to the Paris Conference, which first met on that same day, was composed of Sig. Orlando, Baron Sonnino, Sig. Salandra, Sig. Barzilai and the ambassador, Marquis Salvago-Raggi. On Feb. 17 the debate on the Adriatic question began, but led to no result. In the meanwhile frequent incidents between Italian and Yugoslav soldiers occurred on the frontier. The Adriatic debate in Paris was adjourned to give precedence to the treaty with Germany; to this the Italian delegation agreed, accepting all the proposals of the Allies, including the partition of the German colonies from which Italy was excluded. The delegation was severely blamed in Italy on this account. The Adriatic discussion was then resumed, and on April 23 Wilson published his famous appeal to the Italian people over the heads of their government, setting forth his reasons for opposing certain claims. The message caused wide-spread astonishment as a violation of the rules of secret diplomacy, while in Italy it aroused great indignation. Orlando started for Rome on the 24th to consult Parliament and the country, and was received with enthusiastic demonstrations. In the Chamber his policy was approved by 382 votes to 40 and found adherents even in the Socialist camp.

D'Annunzio took up the Fiume-Dalmatia question with fiery eloquence, and the Nationalists urged the government to annex both. Orlando failed to take advantage of the anxiety of Britain and France that Italy should sign the treaty with Germany, or of Wilson's desire that she should adhere to the League Covenant, to secure advantages for his country, and on May 5 he returned to Paris without having obtained any guarantees for Italy's claims. He found the German treaty ready and Italy's diplomatic position worse than when he had left. Discussions on the Adriatic question were resumed, and various proposals for its solution were advanced, including one suggested by M. Tardieu, on which agreement would have been possible, if President Wilson had not agreed to rejection by Yugo-Slavia. Orlando returned to Rome in June, and on the 19th he was beaten in the Chamber and resigned. Sig. Nitti now formed a new Cabinet, with Senator Tittoni at the Foreign Office, Senator Schanzer at the Treasury and Gen. Albricci as War Minister. On June 28 the new Peace delegation, presided over by Senator Tittoni, left for Paris, and the same day the treaty with Germany was signed by Baron Sonnino and the Marquis Imperiali.

Internal Troubles.—The internal situation now grew more serious. Prices had risen considerably. The government's measures for limiting them merely made the goods disappear for a time and then reappear at still higher prices. The bread subsidy involved a huge deficit in the budget, the doles to the unemployed encouraged idleness, and the regulations hampering trade rendered production ever more difficult. The workers received high wages, but were discontented because prices were rising, while both they and the war profiteers indulged in an orgy of extravagance. The people with fixed incomes felt the pinch most, but everyone grumbled. The Socialists, who now adopted the name of " Maximalists " to affirm their dependence on Moscow, encouraged the workmen in the belief that the War had been fought solely to enrich the capitalists, and that now it was the workers' right to secure all the wealth of the country. Ex-neutralists also helped to foment discontent. In Jan. 1919 the Partito popolare italiano (Catholic) was formed; it had a more definite programme and a more complete organisation than the old Catholic group, and it developed rapidly under the guidance of its political secretary, the Sicilian priest, Don Luigi Sturzo. It advocated reforms of a Christian-Socialist character, including the expropriation of the landed estates for the benefit of the peasants, but with compensation to the landlords. Its foreign policy professed to be patriotic, and favoured co-operation between capital and labour. It attracted some peasants and workers who would otherwise have gone Red.

A series of avowedly revolutionary strikes broke out in every trade, and even in the public services. A postal strike was threatened in Dec. 1918, fomented by the Socialist party, and only called off on the government's promise of higher wages. During a Bolshevik demonstration on April 13 1919 at Milan, a shot was fired at a patriotic *cortège*, which provoked a reaction in the crowd and the offices of the Socialist paper *Avanti!* were wrecked. Strikes of tramwaymen, employees of the secondary railways and the merchant seamen followed in quick succession.

At the Peace Conference, during the absence of the Italian delegation, Mr. Lloyd George and M. Clemenceau ignored the St. Jean de Maurienne agreement, and in accord with President Wilson decided to send Greek troops to Smyrna. Immediately after the Greek landing Italian troops occupied various points in southwest Anatolia. Italian forces co-operated with the British and the French in occupying other parts of Turkey, but the Italian view was that real peace could only be secured by a more conciliatory attitude towards the Turks. At the same time, in order to try to conciliate Greece, Sig. Tittoni concluded an arrangement with M. Veniselos in July 1919 for the delimitation of their respective spheres of military occupation, leaving the Greeks a free hand in Southern Albania. This last clause had an unfortunate effect on Italo-Albanian relations, but the whole agreement was afterwards rescinded, as Greece proved unable to carry out her part of the bargain. Meanwhile Italian steamship companies, banks and business firms showed considerable enterprise in the Near East.

D'Annunzio and Fiume.—Fresh troubles broke out at Fiume (*q.v.*), where on July 2–5 1919 the alleged antipathy of the French troops (mostly colonials) to the Italians and alleged sympathy with the Croats, led to reprisals, in which some French and Annamite soldiers were killed or wounded. The Peace Conference thereupon appointed an inter-Allied commission of inquiry, which proposed the dissolution of the Fiume National Council, elections to be held under inter-Allied control, the disbanding of the Fiume volunteers, the reduction of the Italian garrison, and the importation of British or American police. These proposals were about to be carried out when on Sept. 12 D'Annunzio arrived at Fiume from Ronchi, at the head of some Italian troops, whom he had induced to follow him to save the town for Italy, and a number of volunteers. Most of the Italian troops and seamen in the town and port joined him, and he set up a government of his own. The Allied troops departed, and Nitti stigmatised the poet's conduct in the most violent terms, calling on the workmen and peasants of Italy to back him up against the *Patriotards.* But a large part of Italian opinion supported D'Annunzio, and volunteers, including men of the highest character and also many adventurers, flocked to his standard.

Riots against high prices broke out in the summer of 1919 in various parts of Italy, and agents of the Chambers of Labour illegally requisitioned foodstuffs and other goods for which they paid prices far below the market rates. The Government did nothing. The Socialists and Communists then organised a general protest strike for July 20–1 against the policy of the bourgeois governments towards Soviet Russia and Hungary. But there was no revolutionary outbreak, and the strike was only partial, largely owing to the beginnings of reaction on the part of public opinion voiced by the various citizen committees, rather than to government action. The Fascist movement, under Benito Mussolini now began to arise as a patriotic reaction (*see* FASCISM). Strikes and disorders continued in various parts of Italy, but Sig. Nitti expressed the belief that the only remedy was to let the spirit of unrest wear itself out, regardless of the immediate danger to the country. He had created a new police force, the Guardia Regia, which, however, proved costly and unequal to its duties. The Premier's treatment of the army caused much dissatisfaction. In his desire to restore the "Peace spirit," he failed to protect the soldiers from outrage and insult, and advised them to go about in mufti and disarmed when off duty. A decree of the Minister of War, issued at the instance of Sig. Nitti, granted an amnesty to deserters, thereby placing them on an equal footing with those who had done their duty in the War. In consequence of the findings of the Committee of Inquiry on Caporetto, Cadorna and other generals were put on the retired list.

On Sept. 10 1919 the Peace Treaty with Austria was signed at St. Germain-en-Laye (*see* ST. GERMAIN, TREATY OF), whereby Italy definitely acquired the frontiers assigned to her by the Treaty of London on the north and northeast, plus the Sexton
valley and Tarvis. The German inhabitants of the Alto A
were dissatisfied with this decision, but their treatmen
that time gave no reason for discontent. On Nov. 12 Sena
Tittoni resigned from the Foreign Office and the peace
gation, and was succeeded by the eminent jurist, Sena
Vittorio Scialoja.

INDUSTRIAL AND POLITICAL UNREST

In spite of, or because of, the government's restrictive m
ures, prices had more than doubled. The government had m
the wheat trade a state monopoly. While it requisitioned do
tic wheat at a price below the cost of production, it had to
foreign wheat at the market price. Thus wheat-growing
discouraged at home, and bread was sold below cost ther
increasing the deficit by six milliards. Transport was disorg
ised. While the traffic had decreased, the staff, for demag
reasons, had been increased from 154,000 to 180,000, and af
wards to 240,000; the railwaymen had become more and m
idle and insubordinate and were wholly under the influence
the revolutionary syndicate, and thefts of goods on the railw
had reached unheard-of proportions.

The Extremists.—By the electoral law of Sept. 1919 the prop
tional system, whereby the voter voted not for a candidate but
a list, was adopted to please the Socialists and the Popolari, w
as the only two mass parties hoped to derive benefit from it. T
Socialists at the Bologna Congress decided to present a Ma
malist programme demanding the abolition of capital and
institution of a Soviet Republic, but the extremist group p
posed abstention from the polls and an armed rising. The Po
lari decided to present their own candidates instead of co-oper
ing with other parties; an extreme wing, led by Sig. Miglio
promoted strikes and disorders and differed little from the Soci
ists. The Constitutional groups were split up and were wit
a programme or organisation. The government was discredit
and unpopular. The elections were held on Nov. 16 1919:
Socialists, 101 Popolari and 30 Combatants were returned.
none of the Fascist candidates. On the opening of Parliame
by the King on Dec. 1 the Socialist deputies withdrew from
Chamber, and as a protest against this insult a patriotic dem
stration was held outside, in which some Socialist deputies w
injured. A general strike was proclaimed in consequence, a
at Mantua there were serious riots, the anarchists committing se
eral murders, breaking open the prisons and pillaging the sho

Fresh incidents occurred on the Adriatic coast, and at Sp
lato (Split) the Yugoslav mob attacked the Italian inhabita
under the eyes of the American admiral. Early in Oct. Sena
Tittoni had proposed a *modus vivendi* to D'Annunzio, where
Italian troops would occupy Fiume pending a settlement
Paris, Italy undertaking not to permit the annexation of Fiu
to Yugoslavia; but D'Annunzio refused to agree. At the Pea
Conference various proposals were suggested, but the All
and the United States reached no settlement.

The Socialist successes at the election resulted in further di
orders. On Jan. 13 1920 the postal employees went on strik
because their demands for higher wages were not instantly co
plied with; volunteers replaced the strikers, in spite of offici
discouragement, and this broke the back of the agitation. Bu
on the 22nd the railwaymen struck, and although here too vo
unteers enabled the management to maintain a reduced servic
on the 29th Sig. Nitti came forward with concessions and unde
took not to punish a single striker, in spite of the explicit pro
visions of the regulations. The strike ended in a triumph for th
revolutionists. In the spring there was a two months' strike
the secondary railways of Lombardy, and one at the Mazzon
cotton mills in Piedmont, where the government legitimised t
arbitrary seizure of the factories by the workmen. The railway
men in general refused to run trains conveying soldiers or polic
to places where there were disorders; there was a railway strik
at Cremona and elsewhere because the station-master, who ha
dared to dispatch a train supposed to be conveying war materia
to Poland, then at war with Soviet Russia, was not dismissed

Sig. Nitti, finding himself unable to conduct the Governme

face of the growing opposition, had resigned a first time on
12 1920, but as no one else was prepared to assume office
e difficult conditions, he reconstructed his Cabinet with a
anges. On April 17 the Supreme Council met at San Remo
pare the peace with Turkey, the Adriatic problem was also
discussed, but at the request of M. Trumbich, the Yugo-
Foreign Minister, direct negotiations were instituted at
za a few days later. On May 12 the Cabinet, having been
ed in the Chamber, resigned, and the crisis broke up the
za conference. No other combination having proved pos-
Sig. Nitti was again asked to reconstruct his Cabinet, which
omplished by May 21, but even in its third reincarnation
ved stillborn. The Prime Minister's failure to solve the
ic problem and the indignation aroused by the arrest of
almatians and Fiumani in Rome on account of an alleged
nade his position untenable. On June 4 he enacted a de-
ducing the bread subsidy, but yielding to the threats of the
ists, he withdrew it five days later and resigned without
g for a vote.

itti's Difficulties.—Sig. Giolitti now appeared the only
apable of forming a government, and this he achieved by

budget statement for 1920–1, presented on June 27 1920,
a deficit of 14 milliards.

ubles now broke out in Albania. In 1917 Gen. Ferrero had
imed an Italian protectorate over Albania, but the subse-
agreements whereby Italy undertook to allow Yugoslavia
Greece to occupy parts of the country aroused much
isfaction among Albanians. An Albanian Govt. had been
d at Tirana and the Italian garrisons were greatly reduced;
spring of 1920 Albanian bands began to disturb the Italian
s, and on June 5 they attacked and captured some of the
sts. An attack on Valona was repulsed with loss to the
y, but on June 24 Sig. Giolitti, alarmed at a mutiny which
roken out as a result of anarchist propaganda at Ancona,
yielding to the Socialist demands, announced that Italy
l withdraw her troops from Albania and negotiate with the
a Govt. An agreement was arrived at on Aug. 3, and
pt. 2 the last Italian troops departed, only the islet
seno being retained.

the Spa Conference (July 5–16 1920) Italy succeeded in
g her share of the German indemnity raised to 10%, and
of the Austrian, Hungarian and Bulgarian indemnities to
On Aug. 6 the Tittoni-Veniselos agreement was rescinded,
n the 10th the treaty with Turkey was signed at Sèvres; by
rms of the tripartite agreement Italy obtained "economic
ty" over a wide zone of Anatolia south and east of the
zone (Smyrna) and a concession for exploiting the Heraclea
ields. By a separate agreement with Greece,[1] Italy under-
to cede to the latter the Dodecanese minus Charki and Cas-
izo, which together with Rhodes were to remain Italian for
ars, and then, if Britain ceded Cyprus to Greece, a plebis-
vas to decide the fate of Rhodes.

e Rapallo Conference.—Serious anti-Italian disorders oc-
d on July 11 at Spalato, where the Croat mob murdered the
nander of the cruiser "Puglie" and wounded several officers
nen; protest demonstrations were held at Trieste, and shots
g been fired from one of the Yugoslav institutions, several
m were set on fire. At Fiume the National Council resigned
D'Annunzio proclaimed the Reggenza del Carnaro, for
h he drafted a curious, mystical, semi-medieval statute. As
dent Wilson's term of office was nearly up, the Yugoslavs
hat a direct understanding with Italy would be the best
ion. The Italian Govt. communicated its proposals to those
itain and France, which advised Yugoslavia to accept them.
nference was held at Rapallo on Nov. 8, Italy being repre-
d by Sig. Giolitti, Count Sforza, Sig. Bonomi, Gen. Bado-
nd Admiral Acton; Yugoslavia by MM. Vesnich, Trumbich,
a, Stoyanovich and Col. Kalafatovich. On the 12th the
y was signed. Italy waived her rights over Dalmatia, except
e town of Zara, and the following frontier was agreed upon: Mount Pec, Mount Yalovets; the watershed between the Isonzo and the Wurzen See and the Wocheiner Save, northeast slope of Mount Mezik, east slope of Mount Porzen, west slope of Mount Blegos, Zelse, Cabranska, east of Mount Trstenik, east of Griza, east of Mattuglie, frontier of the Fiume State on the Fiume-Castua road; the islands of Cherso, Lussin, Lagosta and Pelagosa were assigned to Italy, while both Powers recognised the independence of Fiume; the Italian-speaking inhabitants of the territories assigned to Yugoslavia were entitled to opt for Italian citizenship without having to leave the country, and full freedom of language, culture and religion were granted to Yugoslavs in Italian territory.

By a secret clause, which soon became public property, although Count Sforza denied its existence, Porto Baros, an integral part of the port of Fiume, was promised to Yugoslavia. D'Annunzio, however, refused to recognise the treaty, and his *legionari* occupied Castua and the islands of Vegli and Arbe (assigned to Yugoslavia) and tried to invade Dalmatia. But the Government, determined to enforce the treaty, established a blockade round Fiume; on Dec. 23, as D'Annunzio refused to obey Gen. Caviglia's summons to submit, military operations were commenced. There was some fighting, but on the 30th D'Annunzio authorised his plenipotentiaries to accept the conditions imposed. Fiume was to be placed under its own town council, with a local volunteer force to maintain order, assisted by Italian carabinieri, until after the elections for the Constituent Assembly. D'Annunzio left Fiume on Jan. 18 1921. But the elections in the spring of that year led to disorders necessitating the maintenance of Italian troops. The evacuation of Dalmatia, divided for the purpose into three zones, began in the spring of 1921.

Industrial Disturbances.—The internal troubles reached their zenith in the autumn of 1920. There were industrial, agricultural and railway strikes in various parts of the country, and in Sept. a very serious agitation broke out in the metal trades. These industries had earned large profits during the War and were paying high wages. But the cost of production was increasing, and there were signs of a coming slump, so that it was impossible to grant the still higher wages which the workmen now demanded. The workmen of the Romeo works in Milan now adopted obstructive tactics and sabotage, and the management retorted by a lock-out on Aug. 20. Thereupon the F.I.O.M. (*Federazione italiana operai metallurgici*) ordered all the metal workers in Milan to remain in permanence at the mills without working. The Federation of Mechanical Industries then extended the lock-out to the whole of Italy on the 31st, and the workmen, many of them armed, seized a number of factories in Lombardy, Piedmont and elsewhere.

Encouraged by the passive attitude of the authorities, they kidnapped owners and managers and tried to force them to run the works exclusively for the workers; armed "Red Guards" were organised, revolutionary tribunals set up and persons approaching the factories were shot at. At Turin the factory councils attempted to sell the goods manufactured during the occupation, although the owners warned the public of the nullity of such sales. But the workmen found themselves incapable of running the factories unaided, and the occupation ended by becoming merely an occasion for orgies. On Sept. 6 the General Confederation of Labour expressed its approval of the occupation, but declared that the movement must be placed under its own guidance in order to secure "collective management," and forbade any further extension of the seizures for the present. Nevertheless the extremists became more truculent, and at Turin a Nationalist student and a prison warder who happened to be passing near an "occupied" factory were brutally murdered by "Red Guards," and in many works the safes were broken open and the contents pocketed by the leaders.

Sig. Giolitti at last felt that he must do something. He summoned the representatives of the owners and the workers to meet him on Sept. 19 in Rome. At this meeting an agreement was arrived at; wages were to be raised and a form of workmen's control over industry, which the Government undertook to embody in a bill, was agreed to. The owners also agreed to pay for the work performed during the occupation, with deductions for damage done to the plant, but they refused to readmit all the workmen as the Government demanded, and only did so at last under protest against this imposition. The factories were evacuated on the 27th and work was resumed on Oct. 4. As a practical attempt to establish Communism, as the group by Bombacci hoped, the agitation had failed, and Giolitti claimed that by proving to the workmen that they could not run industry without the capitalist and the expert, they had been taught a useful lesson. But the Premier's real motive was probably the fear of provoking revolution and distrust of the nation's patriotism and courage. Incidentally the "occupation" wrought serious injury to Italian credit at home and abroad.

---

[1] enounced by Italy, Oct 8. 1922.

The Fascists.—About this time agrarian troubles had also broken out in various parts of Italy, notably in the Veneto, the provinces of Bergamo and Cremona, the Lazio, Tuscany and Sicily. The peasants demanded contracts which, if accepted, would have left the landlords without enough income to pay the taxes. In this agitation Socialist and Left-wing Popolari vied with each other in revolutionary methods. The public meanwhile was beginning to weary of these constant disorders and of the tyranny of a factious minority, and the middle classes set to work to organise resistance. The Agrarian Association of Bologna was particularly active, but it was the Fasci, now arising all over Italy, under Mussolini's leadership, which organised the national reaction. The first attempt at resistance at Bologna, the hotbed of revolution, was on Sept. 20, when, as the result of a Communist attack on a patriotic procession, a kiosk where seditious papers were sold was destroyed. At a strike demonstration in the same city in Oct. 14 1920 against the "white terror" in Hungary, the Anarchist, Malatesta, incited the mob to violence, and a police inspector and a Guardia Regia were murdered. Small groups of Nationalists and Fascists thereupon paraded the streets; in an instant the tricolour flag appeared everywhere and the strike ceased. The municipal elections in Oct. and Nov. registered a decline in Socialist influence in Rome, Naples, Turin, Genoa, Venice and Florence, but at Milan and Bologna revolutionary majorities were again returned.

The assumption to office of the Red administrations was to offer occasion for fresh outbreaks of violence. In Bologna the Communist deputy, Bucco, secretary of the local Chamber of Labour who had been the Red tyrant of the province, now began to fear for his own safety and applied for police protection against the Fascists; he was spirited out of the city and after his departure a deficit of a quarter of a million was found in the accounts of the Chamber of Labour. On Nov. 21 1920 the first meeting of the new Bologna town council was intended to be the occasion for an armed rising organised by the Communists, with the help of the municipal guards and the fire brigade. There were anti-Socialist demonstrations in the streets organised by the Nationalists and Fascists, supported by other citizens, but in the town hall two councillors of the constitutional minority, Giordani, a disabled ex-officer, and Colliva were murdered by Communists. The upheaval of public opinion was now irresistible; the Red leaders had to fly for their lives and the whole fabric of Bolshevik organisation in Bologna crashed. The town council never met again and was eventually dissolved, while the Fascists wrecked or burned down various Socialist institutions. At Modena a Fascist was murdered and several others shared a like fate while attending their comrades' funeral; this led to a general anti-Socialist uprising there also, and similar episodes occurred at Ferrara. Throughout the Po valley the Fascists proceeded to break the tyranny of the "Red baronies"; the revolutionary *leghe* which had dominated labour in that area, were dissolved, and one Red town council after another resigned or was dissolved by the prefects, while ever increasing masses of workers, industrial and agricultural, went over to Fascism and thus formed the basis of the Fascist labour movement.

Socialist Dissensions.—During the last months the Maximalist Socialist party had begun to show signs of dissension. The extremist group led by Bombacci and Gennari advocated an immediate revolution, while the Turati-Treves group opposed the idea; at the Reggio Emilia congress Nofri and Ponzani,
had returned from Russia, proceeded to condemn the So
system. The Russian leaders demanded the absolute submis
of the Italian party to the orders of Moscow and the expuls
of all Socialists tainted with the Reformist heresy. At the
eral congress of the party in Leghorn (Jan. 13–22) a resolut
in favour of a middle tendency, supported by Turati, Tr
Buozzi, Baldesi, D'Aragona and the G.C.L., who called th
selves *Unitari* and were prepared to collaborate with bourg
Governments, was adopted. The Communists (represente
18 deputies) thereupon broke away and formed a party of
own. The new party now tried to affirm itself by a series of
rorist outrages in the hope of promoting revolution. Bombs
thrown in Florence on Feb. 27, killing and wounding several
sons, whereupon the Fascists retaliated by murdering Lavag
a notorious Communist railway organiser; the railwaymen
electricians went on strike and various affrays between Com
nists and Fascists occurred, until the troops intervened
restored order. At Empoli a number of unarmed sailors were
dered by Communists, and the Fascists, summoned from vari
parts of the country, inflicted severe reprisals. Similar oc
rences took place at Foiano della Chiana and other places.
everywhere the popular reaction, guided by Fascists and
tionalists, was vigorous and unmistakable. The Governme
unable to tackle the situation, itself, left the Fascists a free
to fight the Reds.

Sig. Giolitti now had the courage to propose the abolition
the bread subsidy, and presented a bill to that effect, which
voted by a large majority on March 1, in spite of Socialist
struction. The bill in favour of syndicalist control over indus
presented by the Premier in accordance with the agreement
the preceding Sept., encountered much opposition in Par
ment and was finally dropped.

Giolitti Resigns.—The Parliamentary position was becom
insecure, and a hostile motion on foreign policy proposed by
Amendola was rejected only by a small majority. On Apri
1920 Sig. Giolitti dissolved the Chamber, and on May 15
elections were held. Out of 535 seats (27 had been added for
new provinces) the Liberals and Democrats of various sha
secured 275, the Popolari rose from 101 to 107, the Socialists
from 156 to 122 Unitari and 16 Communists; there were in ad
tion four Germans for the Alto Adige and five Slavs for the Ve
zia Giulia. The Fascists were 38 and the Nationalists 10.
though the composition of the new Chamber was not very di
ent from that of the old, the Socialists and Communists
now faced by a vigorous Fascist-Nationalist group supporte
sympathisers belonging to other parties. On June 11 Parlia
opened, and in the debate on the speech from the Throne,
Nationalist Federzoni (*q.v.*) delivered a strong attack on C
Sforza's foreign policy. On June 26 the Cabinet secured only
small majority on a vote of confidence on foreign policy,
Sig. Giolitti resigned.

Sig. Bonomi formed an administration composed as follow
Bonomi (Presidency and Interior), Marquis Tomasi della T
retta (Foreign Affairs), Giradini (Colonies), Rodinò (Justice
Soleri (Finance), De Nava (Treasury), Micheli (Public Works
Belotti (Industry and Trade), Bergamasco (Marine), Corbi
(Education), Mauri (Agriculture), Beneduce (Labour), Giuffri
(Post Office), Ranieri (Liberated Territories). The Cab
comprised members of many parties, but the Popolari we
predominant and Don Sturzo ruled Sig. Bonomi with a rod
iron. Under Popolare influence, strengthened by that of these
Socialists Giuffrida and Beneduce, further advanced legislatio
was enacted. A bill enabling any public body to expropriat
land which in its opinion was inadequately cultivated, the owne
to be indemnified with land bonds of uncertain value paid for b
the whole community was introduced but aroused violent opp
sition and never became law.

Sig. Bonomi had the merit of deciding that the celebration
the ceremony for the Unknown Soldier should at last be held;
took place on Nov. 4 1921. Two days later the Fascist congre
was opened in Rome, and Fascism was definitely constituted in

al party. On the 10th the Communists and Socialists
ned a general strike as a protest against the presence of
cists in Rome; disorders ensued, in which five persons
lled and several wounded. The troubles had ceased by
n, after which the Fascist congress broke up. The debate
Chamber on the eligibility of the deserter Misiano, who
n returned for Turin and Naples, led to violent scenes,
Dec. 20 his election was annulled. During this same
the Banco di Sconto failed, and the Government was se-
lamed for not having prevented the collapse of so impor-
institution, whose actual condition was by no means
; as was proved at the subsequent legal proceedings be-
Senate,[1] the failure caused serious prejudice to the general
l and economic situation of the country.

publication by a French journalist of an account of an
ty insult attributed to M. Briand against the Italian
t the Washington disarmament conference led to anti-
demonstrations at Turin and elsewhere, until the mis-
anding was cleared up. The attempt to conclude a
cial treaty with Russia failed, as the Soviet Govt. refused
y the agreement. In Jan. 1922 Sig. Bonomi attended the
meeting of the Supreme Council, where it was decided
an economic conference in Genoa in the spring.

Facta Govt.—The Bonomi Cabinet was now attacked
sides, and when on Feb. 2 1922 the Democrats, 16
n were in the Government, went over to the Opposition,
nomi resigned. The King, however, asked him to go
Parliament, in order that by its vote it might give some
ion for a solution. This Bonomi did, and the Cabinet
been beaten on the 17th resigned definitely. It was not
e 25th that a new Cabinet was formed by Sig. Luigi
He was a thoroughly honest man, and his acceptance of
these circumstances was proof of his patriotism, but he
t a first-class statesman. He selected Senator Schanzer
Foreign Office, while the other Ministers were of respecta-
liocrity. On March 15 the Premier communicated to the
er the Government's programme, based on the restora-
order, and secured a vote of confidence.

ble now broke out in the port of Naples between the Red
' union, which wished to retain its labour monopoly,
new Fascist dockers' union, created to combat the pre-
conditions of anarchy and graft brought about by the
The Red union proclaimed a strike in all the Italian ports
rch 18 as a protest against the existence of the Fascist
and the Government referred the solution of the conflict
enti-autonomi of the ports, a decision which caused much
faction in non-Socialist circles, as those bodies were
usly under Socialist influence. But the Fascists eventually
led in breaking the Red monopoly and restoring order
edom of labour in the ports, to the great advantage of
ritime trade of Italy.

Genoa conference was inaugurated on April 10. Sig.
presided with dignity, but the hardest work was accom-
l by Sig. Schanzer, who often succeeded in composing
nces between the British and the French and between the
and the Germans and Russians. The Russian delegation
first alarmed at the possibility of an unfriendly reception
Fascists, but the Fascist party directorate assured the
viks that if they abstained from interference in Italian
l affairs they would not be molested; this they undertook
and they carried out their undertaking.

railway syndicate at Bologna issued an order that all
was to be held up on May 1, and although the manage-
was able to secure an almost complete service, many rail-
n did cease work, thereby causing inconvenience and
delay. This time the Government did indict the members of the executive committee of the syndicate, and some of the leaders were punished. On May 24 the funeral procession escorting the body of the war hero Enrico Toti to the cemetery in Rome was fired on by Communists in the San Lorenzo quarter, with the result that two persons were killed and several wounded. The next day the Committee of Proletarian Defence and the Alleanza del Lavoro, a newly formed coalition of the Communist, Socialist and Republican parties and the G.O.L., ordered a general strike in Rome; the Fascists tried to organise a counter-demonstration, but were dispersed by the police. This strike, which ended on May 26, intensified the exasperation of all law-abiding citizens against agitators.

The Bologna Reds.—In the province of Bologna the Red unions had lost much of their influence, but the leaders managed to maintain authority with the acquiescence of the Government. While locally there was a scarcity of labour and very high wages, in the neighbouring provinces there was unemployment, but the Bologna union leaders were determined to prevent the migration of these "foreign" workers, lest their own monopoly should be menaced, and they induced the prefect to forbid it. The prefect's action was *ultra vires* as it violated the rights of individuals in the interest of a privileged class, and the Fascists, voicing the general indignation which it aroused, concentrated on Bologna in military formation and demanded the revocation of the decree and the removal of the prefect. Sig. Mussolini, having obtained satisfactory assurances from the Government, ordered the Black Shirts to demobilise and evacuate the city, which they did on June 2; the decree was then revoked, and the prefect transferred.

There were now rumours of a new cabinet crisis, and the Socialists were divided on the question of collaborating with a bourgeois government. The Fascists, Nationalists and the Right were opposed to any sort of Socialist infiltration, which would involve unlimited extravagance and more advanced legislation. On July 12 1922 Sig. Peano, the Treasury Minister, issued his financial statement for 1921–2, which showed a deficit of 4,500 million lire, while experts estimated it at 6,500 million; public opinion was seriously alarmed, but in Parliament the deputies were too busy over lobby intrigue in view of the expected crisis to worry about finance. There were disorders at Cremona, provoked by the left wing Popolari led by Miglioli and the Socialists; the Fascists mobilised and wrecked several Socialist institutions and Miglioli's own law offices. The Democrats in the Chamber seized the occasion to contract an alliance with the Popolari, and on July 19 Sig. Facta was outvoted and resigned. But it proved impossible to form a new Cabinet, and after various unsuccessful attempts by Bonomi, Orlando and Meda, during which even the Socialist Turati was summoned to the Quirinal for consultation, the King sent for Facta once more, and the old Cabinet was reconstructed, with Senator Taddei, prefect of Turin, as Minister of the Interior.

The General Strike.—On Aug. 1 a general strike throughout Italy was suddenly proclaimed by the Alleanza del Lavoro, as the result of a Communist initiative, supported by the Socialists, who were disappointed at having failed to secure a Democratic-Socialist Cabinet, and Turati proclaimed it a "legalist" strike, because its professed object was to affirm the authority of the State against the Fascists. Work was suspended in many factories and a part of the railwaymen struck; but the Fascists and Nationalists ordered a general mobilisation, and the Fascist directorate issued a manifesto calling on the public servants and the workers "to shake off the yoke of the politicians by whom they were led," and giving the Government 48 hours within which to prove that it possessed authority over its own employees and those who were attempting to destroy the nation. "On the expiry of this delay Fascism will assume full freedom to supplant the State." Serious conflicts between Fascists and Communists occurred at Milan, Ancona and other places, but the strike rapidly collapsed, and on the 2nd the Alleanza del Lavoro ordered it to cease; by the 4th all disturbances were over. During the strike agitation the Fascists delivered an attack on the Communist-

---

case was tried by the Senate because there were senators
the accused.

Socialist municipality of Milan, which had for years ruled the city, bringing it to the verge of ruin and indulging in the most scandalous graft; the deficit was 375,000,000, there were bills for 101,000,000 lire overdue, and the richest city in Italy could obtain no credit anywhere.

The Liberal *Corrière della Sera*, as well as the Fascist press, had been conducting a very vigorous campaign against the administration, but the Government did not interfere. On Aug. 1 the tramwaymen, electricians, sweepers, employees of the waterworks and firemen of the city, all struck, but the Fascists and other citizens took their places; on the 3rd the Fascists succeeded in getting into the town hall and expelling the few assessors present, and for the first time since 1914 the tricolour was raised on Palazzo Marino amid scenes of great popular enthusiasm. The Fascists withdrew on the 4th and handed over the building to the prefect's commissioner. On the 27th, after the disastrous results of the inquiry into its financial administration, the council was dissolved and a royal commissioner placed in charge.

At Genoa the Fascists led a similar operation against the port consortium, which was largely under the influence of the Red dockers' union. Under Fascist pressure the consortium was dissolved and a royal commissioner appointed. The Fascists extended their action against a number of Socialist, Communist and Popolare town councils and institutions, forcing the administrators to resign; sometimes violence was resorted to, but in most cases the administrations resigned from sheer fright; very frequently evidence of embezzlement was discovered. Another operation was carried out against the provincial administration of Trento, and the Governor, Sig. Credaro, accused of being under the influence of the anti-Italian Pan-German elements of Bolzano, was recalled by the Government on the initiative of the Fascists. All these actions were of course illegal, but public opinion approved of them because it considered that the Fascists were doing what the Government should have done before.

The Fascist Programme.—Facta's position was daily weakening, and indeed the whole machinery of government was obviously breaking down. At the Socialist congress held on Oct. 3 the party split into two groups, the *Unitari* or collaborationists and the uncompromising *Massimalisti*; as a result of this split the G.C.L. broke off its alliance with the Socialist party and declared itself a non-political body, but many of its adherents had already gone over to Fascism. The Partito Popolare was also divided by conflicting tendencies, and the Pope enjoined on the bishops and clergy to abstain from partisan political activity. The moment was now ripe for a bold Fascist move. Sig. Mussolini considered that it was not enough to crush Bolshevism, and that if Italy was to become a really great nation the whole body politic must be reformed on Fascist lines, and the national finances re-established by eliminating extremist legislation and extravagance.

Although many Liberals approved of the Fascist programme, the Fascists themselves were convinced that it could not be carried out under normal Parliamentary conditions. They now demanded of the Government either a dissolution or the resignation of Facta and the formation of a new Cabinet comprising five Fascist Ministers; but the Premier rejected both alternatives. At a Fascist gathering at Udine on Sept. 29 Mussolini made an important declaration in favour of the monarchy, thereby securing the support of many non-Fascists. His hints at a revolution, however, were still regarded as figures of speech, but he was now entrusted by the party directorate with a mandate to conduct a political and even military action to bring Fascism into power. On Oct. 24 another Fascist congress was held at Naples, where 40,000 Fascists in military formation paraded the streets. In his speech at the San Carlo theatre Mussolini said that "what we have in view is the introduction into the Liberal State, which has fulfilled its functions . . . of all the forces of the new generation which has emerged from the War and the victory." In another speech he declared that "either the Government will be given to us or we shall seize it by marching on Rome."

March on Rome.—That same evening the Fascist Quadrumvirate was formed, composed of Michele Bianchi, general secretary of the party, Italo Balbo, commander of the armed *sq*
Gen. De Bono (ex-commander of the IX. Corps), who
organised them, and the deputy C. M. De Vecchi, while
Grandi, an authority on labour problems, was entrusted wit
political functions of the enterprise. The congress broke up
Salandra and Orlando, acting on behalf of the Quadrumv
called on Facta to resign, which, after some hesitation, he d
the 27th. In the meanwhile the general mobilisation of the
cists had been ordered, and they proceeded to concentrat
Rome in four columns. Both the Fascist leaders and the
officers were anxious to avoid any conflict between the *sq*
and the troops, and the news that martial law had been
claimed caused deep consternation. Facta had indeed dr
and issued the decree, but the King refused to sign it as it w
have meant civil war, and it was immediately withdrawn.
Salandra was now entrusted with the formation of a Cab
and he offered portfolios to De Vecchi and Grandi; but Muss
on being consulted rejected the proposal, for the formation
Cabinet of the old parliamentary type was now impossible.
Salandra's advice the King sent for Mussolini. The Fascist
umns began to enter Rome on the morning of Oct. 30 1922
the city was peacefully occupied; the only regrettable incid
were the murder of a Fascist at Valmontone by Commu
and the murder of some Communists by Fascists in the
Lorenzo quarter of Rome. Mussolini reached Rome from M
the same day, and at once presented himself to the King, wit
Cabinet list already prepared, which the King at once accep
As the presence of the *squadre* in Rome was no longer necess
and might lead to trouble, Mussolini ordered them to dep
this they began to do on Oct. 31, after paying a tribute of ho
to the tomb of the Unknown Soldier and homage to the K
by Nov. 2 all had left the capital.

The new Cabinet was composed as follows: Mussolini, Pre
and Minister of Foreign Affairs and the Interior; Gen.
(War), Adm. Thaon di Revel (Marine), Prof. Alberto De
fani (Finance), Prof. Tangorra (Treasury), Duke di Ce
(Post Office), Federzoni (Colonies), Prof. Gentile (Educati
De Capitani (Agriculture), Carnazza (Public Works), C
Teofilo Rossi (Industry), Cavazzoni (Labour), De Vecchi (
der-Secretary for Pensions). Although predominantly Fas
the Cabinet comprised members of all the chief groups ex
the anti-national parties; Rossi was a Giolittian, Cesar
Social Democrat, Gentile[1] and De Capitani Liberals, Tang
and Cavazzoni Popolari. Sig. Mussolini did not have a P
mentary majority, but he was supported by the mass of pu
opinion even outside Fascist circles. He gave stringent or
for the cessation of all acts of violence, and for the reinst
ment of the town councils which had been forced by the Fasc
to resign after Nov. 1. Occasional conflicts still occurred
on the whole order was restored with surprising rapidity.

On Nov. 16 the Premier informed the Chamber that for
second time the Italian people had given themselves a Gove
ment independent of any Parliamentary designation,[2] that
might have closed Parliament and formed a purely Fascist Ca
net, but that he preferred, at all events in the first phase, to fo
a coalition with all the national parties. He undertook to bala
the budget, provide for the working classes, but not in accorda
with any extravagant theories, and conduct the foreign pol
of Italy with firmness and dignity. He finally asked fo
powers for a year to carry out the necessary reforms, and th
were granted by 275 votes to 90. The Nationalists were n
absorbed into the Fascist party.

The Deficit.—The most urgent problem before the new Go
ernment was finance. The estimated deficit for 1922–3 was 6,
million lire and Sig. De Stefani at once proceeded to adopt dras
economies, reorganise taxation and encourage economic activ
without hindrances to production. Prof. Tangorra having d
on Dec. 21 De Stefani took charge of the Treasury as well. T
Ministry of the Liberated Territories and several under-secreta
ships were abolished, and by the decree of Jan. 23 1923 the Go

[2] The first was in May 1915.

t was enabled during one year to place on the retired list ials who were too old or otherwise incapable of fulfilling ıties, and to revise all appointments made under special islation since May 1915. The Guardia Regia, which had wered its purpose on account of defective discipline and ation, was disbanded. The Fascist and other armed were also disbanded, and the *Milizia Volontaria per la a nazionale* (*see* FASCISM), composed of *ex-squadristi* and l by ex-army officers, was created in Jan. 1923 to assist maintenance of order. In the administration of justice courts of cassation were reduced to one, and many minor uppressed. The railway staff, which amounted to 225,000 ne Fascists came into power, was reduced to 170,000. ge number of abuses were eliminated; the eight hours' nich had been reduced to five or six hours of real work, tored; railway thefts and damage to property were brought o trifling proportions, the system of equalising wages, so linesman or engine-driver was paid as highly as, or more n important official, was done away with; the free passes o the leaders of the revolutionary *sindacato ferrovieri* and other persons were withdrawn, discipline was re-estab- and bonuses for economy reintroduced. These reforms, were largely the work of the special high commissioner railways, Sig. Edoardo Torre, resulted in improving the out of all recognition, and converting the railway deficit, in 1921–2 amounted to 1,400 million lire, into a surplus of ,000 for 1924–5. A similar transformation was effected postal and telegraph services, where insubordination and nisation had reached incredible proportions under the s governments; here too a deficit of some 500,000,000 was ted into a surplus of 43,000,000. Originally the Govern- tended to restore the railways and some of the postal serv- private enterprise; this has been done for the telephones uly 1 1925, but not for the railways. Reforms of a similar were introduced into many other departments, and every- the number of officials was reduced.

Yannina Murders.—Soon after coming into power Sig. lini attended the opening of the Lausanne conference on ace with Turkey, and there he first came into contact is British and French colleagues. On Aug. 27 1923 the General Tellini, president of the inter-Allied commission delimitation of the Graeco-Albanian frontier, and four staff were murdered by Epirote bands near Yannina on territory, as a result of a violent campaign in the Greek gainst Tellini, who was accused of unduly favouring the an claims. On the 29th the Italian Govt. presented an tum to Greece demanding immediate satisfaction and an nity of 50,000,000 lire. As the Greek Govt. rejected some conditions, and denied responsibility for the crime, an fleet was sent to Corfu to occupy the island. The Greek ander having refused to lower the flag a few shots were n the fort, one of which killed or wounded a number of es,[1] who, unknown to the Italian admiral, were lodged in e island was then occupied. On Sept. 1 Greece appealed League of Nations Council, but as the Conference of Am- dors had also been invested with the conflict, the Italian te to the League Council, Sig. Salandra, maintained that onference alone was competent to deal with the matter, as the British delegate, Lord Robert (now Viscount) Ce- e Greek delegate, M. Politis; and the delegates of the small s insisted on the League's right to intervene. After ar- g that an inquiry should be conducted by the four Great s[2] the Conference of Ambassadors finally decided that e should make full satisfaction in the most solemn form ly and pay the indemnity of 50,000,000 lire. Italy declared he occupation of Corfu had no other object than that of obtaining satisfaction for its demands. On the 13th the Conference announced Greece's acceptance of its decision and Italy's undertaking to evacuate Corfu by the 27th, which was done. As a result of the conflict Italo-Greek relations were much improved, but there were controversies in the League Council between Sig. Salandra and Lord Robert Cecil and the delegates of Sweden and Norway.

The next important action of the Fascist Govt. in the field of foreign affairs was the settlement with Yugoslavia. As Sig. Mussolini had long recognised the difficulty of fully carrying out the Rapallo and Santa Margherita agreements, he had suggested, as early as Nov. 1922, to M. Ninchich the advisability of a more complete agreement. The Santa Margherita convention was ratified on Feb. 21 1923, and Italy proceeded to evacuate the third Dalmatian zone,[3] but the existence of the Fiume Free State was the chief obstacle to a real understanding. Sig. Depoli, head of the government, had resigned, as he could not continue to rule the town, which was threatened with starvation, and Sig. Mussolini sent Gen. Giardino to Fiume in Sept. 1923 to take charge of the administration, and provided him with adequate funds. Negotiations with Yugoslavia were then resumed, and on Jan. 27 1924 the various agreements were signed in Rome. By the first of these the two Powers undertook to collaborate in maintaining the conditions established by the peace treaties and to assist each other politically and diplomatically in case of a conflict. By a second convention Italy recognised Yugoslavia's full sovereignty over Porto Baros and the Delta, while Yugoslavia recognised that of Italy over Fiume; a free customs zone was also established comprising Fiume and Castua (the latter ceded to Yugoslavia). Ratifications were exchanged on Feb. 22, and subsequently a series of commercial agreements was concluded.

Mussolini and Parliament.—One of the main considerations of the Fascist party was the relation of the executive to the legislature. Parliament in Italy had long been degenerating, and after the War conditions had become worse than ever. Sig. Mussolini was determined not only to eliminate certain evils, but to prevent their recurrence, and above all to give stability to the government. In the summer of 1923 he drafted a bill whereby the country was divided into 15 constituencies, each voter to vote for the party list which he preferred, the party securing relatively the largest number of votes to be entitled to two-thirds of the seats in the Chamber, while the remaining third was divided among the other parties on a proportional basis. The bill encountered much opposition among the Socialists and the Popolari, and also among some sections of the Liberals, but it was admittedly only a temporary and tentative measure, and it was voted by a large majority in the Chamber in July and by the Senate in Nov. 1923. At a Cabinet Council on Dec. 31 the government renounced the full powers granted to it by Parliament a year previously, and on Jan. 25 1924 Parliament was dissolved.

Sig. Mussolini stated that he now wished to appeal to the country for a verdict on the work accomplished, but that, while recognising the value of the elective Chamber, it must not be accorded absolute predominance over the other organs of the State—the Crown, the Senate, the Executive—all of which have their allotted functions. He rejected the idea of electoral and political alliances with other parties, but decided to include in the government electoral list men of all parties or no party who might be counted on to render services to the country. He approached certain leading Liberal and Democratic statesmen of Southern Italy, where Fascism had less hold than in the North, in order to include them in the Government list. Salandra, Orlando, De Nicola and De Nava accepted. The Duke of Cesarò, Minister of Posts and Telegraphs, having quarrelled with the Premier over the latter's refusal to contract an alliance with the Social Democratic party, and also because he disapproved of certain influential Fascists, resigned and presented an opposition list of his own, chiefly in Sicily.

The Government list was prepared by the Fascist representa-

---

lonel Lowe, of the Near East Relief Organisation, deposed ne casualties amounted to 100, including 20 dead, of whom 16 hildren.

r full details of the incident see the article by "Verax" in *ta italiana* for Dec. 15 1923; and for text of report see *The a Murders* and *The Occupation of Corfu*, George Glasgow on, 1923).

[3] The port of Dalmatia assigned to Italy by the Treaty of London and ceded by her to Yugoslavia at Rapallo had been divided for the purpose of evacuation into three zones.

tives in each constituency, passed by the "Pentarchy" (Finzi Michele Bianchi, Giunta, Acerbo and Cesare Rossi) and finally submitted to Mussolini for approval. In four constituencies there were extra lists for government supporters for whom there was no room in the government list proper. The government candidates comprised 200 ex-combatants, and a number of men eminent in science, literature, business, agriculture and industry. The opposition groups competed for the 179 seats reserved for the minorities. The elections were held on April 6, and, except in a very few cases, went off without disturbances. In all 7,628,859 votes were recorded (73% of the registered voters, a larger percentage than at any previous election). Of these 4,693,690 were for the government, *i.e.*, 65·25% of the recorded votes, not including those in favour of minority candidates who had declared themselves supporters of the Government; the Government thus would have been entitled to two-thirds of the seats independently of the new law. The supporters of the Government were 355 (Sig. De Nava having died), of whom 260 were Fascists and 114 members of other groups. The opposition groups were distributed as follows: Constitutional Opposition 12, Liberal Democrats 17, Social Democrats 11, Popolari 40, Massimalists 22, Unitari Socialists 27, Communists 17, Republicans seven. Of the ex-Premiers, Bonomi was not returned; Nitti and Facta did not stand, but Facta was raised to the Senate soon afterwards.

The Matteotti Murder.—Parliament was opened by the King on May 24 1924. After his overwhelming victory at the polls Sig. Mussolini held out the olive branch to the Opposition parties, and everything seemed to point to a return to normal political conditions; on June 7 the Chamber gave the Cabinet a vote of confidence by 361 to 107. But on June 10 the Socialist deputy Giacomo Matteotti, Secretary of the Unitario group, mysteriously disappeared, and a day or two later it was discovered that he had been kidnapped in a motor-car by Dumini, Volpi and other Fascists of shady antecedents and carried off to an unknown destination. The kidnappers, suspected of complicity in attacks on other anti-Fascist leaders, were caught at once, and four prominent Fascists—Marinelli, the administrative secretary of the party; Filippelli, editor of the *Corriere italiano;* Cesare Rossi, head of the official press bureau; and Naldi, the editor of the *Nuovo Paese*—were also arrested as accomplices. The body of Matteotti was discovered on June 13 buried in a lonely spot 20 km. from Rome.

The affair created a sensation, and the Opposition deputies and press seized on it to indulge in the gravest accusations against all the leading Fascists. On June 15 the Opposition deputies withdrew from the Chamber, stating that they would not return until the Matteotti mystery and the so-called "moral question"—that is, the supposed complicity of the Government in the affair—had been cleared up. The Opposition by this so-called "withdrawal on to the Aventine"[1] thus hoped to render Parliamentary business impossible and to exploit the consternation aroused by the crime to upset the Fascist Government. Among the persons more directly accused was Aldo Finzi, Under-Secretary for the Interior; he immediately resigned, and his resignation was accepted by the Premier as he had not proved equal to his duties, but when he brought libel actions against his accusers they were unable to prove their case by evidence.

The Chamber was now adjourned, and on the 16th Gen. De Bono, whose activities as chief of police had appeared faulty, was replaced by Sig. Crispo Moncada, prefect of Trieste. The same day Sig. Federzoni was transferred from the Colonial Ministry to that of the Interior: he immediately cleared the department of the doubtful elements who had taken advantage of their connection with it for purposes of their own. On the 30th all the Ministers placed their portfolios in the Premier's hands, and he effected the following changes: Federzoni, who had become Minister of the Interior, was replaced at the Colonial Ministry by Prince di Scalea, Gentile (Education) by Count Alessandro Casati, Carnazza (Public Works) by Gino Sarro Corbino (National Economy) by Cesare Nava. Most of under-secretaries were also changed, and many undesira expelled from the Fascist party.

Opposition Tactics.—The Opposition saw in the Matt affair a chance of mobilising a part of the nation against Government, and secured the support of many who had adh to Fascism only as long as they had believed it to be invinc and were ready to abandon it the moment they thought tha days were numbered. Orlando, who had been elected on Government list, and Giolitti, who had declared himself ben lently independent, joined the Opposition, professedly on stitutional grounds, but did not withdraw from the Cham The "Aventine" groups on June 27 confirmed their absten from Parliamentary activity, demanded the disbanding of Milizia nazionale, the repression of all acts of violence by cists (without mentioning those committed by non-Fasci and formed a committee for joint action; their unofficial lea was Giovanni Amendola. The conduct of the constituti Opposition, in allying itself with the revolutionary Social and the Popolari extremists, was much criticised even in Fascist circles. Various new Opposition associations were formed, such as the Lega italica, the Italia libera (with wh Gen. Peppino Garibaldi was connected), the Unione nazion etc. The directorate of the ex-combatants' association assumed an attitude of veiled hostility to the Government, as this created a sharp division within its ranks the Governm dissolved the directorate and placed a temporary board in cha

The press campaign now reached an unparalleled degree violence, Don Sturzo's *Popolo* vying with the Socialist *Ava* and Amendola's *Mondo*, and was a direct incitement to ma acts of violence committed against Fascists.[2] Sig. Musso therefore decided on July 8 to call into force the decree of J 12 1923 drafted by the Duke of Cesarò, and the prefects w ordered to apply Art. 3 of the Communal and Provincial l whereby in the interests of public order they were empowe to confiscate issues of papers containing seditious matter incitements to violence, and in the case of repeated offen temporarily to suspend their publication. This measure w afterwards completed by the royal decree of March 4 19 Several Liberal and Democratic organs which systematica attacked the Government were acquired by pro-Fascists.

The Crespi family, who were the chief shareholders of Milan *Corrière della Sera*, bought out Senator Albertini and brothers, who had for many years edited the paper; it th became more favourable to the Government in its outlook. T Milan *Secolo*, the Rome *Giornale d'Italia* and the Naples *Matti* as well as some other papers, have undergone a similar transfo mation; many of the members of the staff remained with th respective papers under the new conditions, while those w refused to do so received large indemnities under the very liber provisions of the Italian law on journalistic contracts. Seve opposition papers continued to exist, including the Democra *Mondo*, the *Voce Republicana*, the *Avanti!*, etc., but can exerc little influence. These measures were admittedly of a temp rary character, enacted in view of the transition from the to the new régime. An important reform was carried out in t Milizia nazionale; the decree of Aug. 4 provided that its memb should swear allegiance to the King. On Oct. 28 the Miliz took the oath.

In the field of foreign affairs a treaty was concluded wi Britain whereby the Transjuba territory was ceded to Ital There had been a previous agreement to that effect, but t British Foreign Office had raised difficulties, claiming that t question should be settled together with that of the Dodecanes the Italian Govt. persuaded Mr. Ramsay MacDonald that t two questions were wholly unconnected, and the treaty w signed on July 15 1924, whereby Italy secured a larger ar than had been at first contemplated. Ratifications were e changed on May 1 1925.

---

[1] After the withdrawal of the Roman *plebs* on to the Aventine Hill as a protest against the aristocracy. Opposition deputies did not, as has often been reported in the foreign press, actually meet on the Aventine.

[2] Since the Matteotti murder 65 Fascists have been murdered b their opponents; among the victims was the deputy Casalini.

solini's Skill.—The Government's position had been
otedly shaken by the Matteotti affair, but no evidence
oduced implicating any of its members in it, and Sig.
lini parried the attack with consummate skill. The Fas-
rty, except for an insignificant number of defections,
round him solidly, and after the first bewilderment non-
pinion continued its support of him. The country tended
n down, in spite of occasional regrettable incidents pro-
by both sides, of which the most serious was the murder
Fascist deputy Casalini by a Communist on Sept. 12 1924.
hamber opened on Nov. 12, Orlando and the Communists
resent, while later Giolitti's attack on the Government
unconstitutional methods caused some surprise as coming
statesman who while in office had proved a past-master
art of violating the Constitution. The Premier had come
conclusion that the electoral law enacted in 1923 had not
satisfactory, and on Dec. 20 he presented a bill to Parlia-
roviding for the re-establishment of the old one-member
uency system, eventually passed by 307 votes to 33, and
ed by the Senate on Feb. 10 1925. This measure divided
ventine," as the Democrats and Liberals were in favour
while the Socialists and Popolari were proportionalists.
peech in the Chamber on Jan. 3 1925, Mussolini reaffirmed
compromising policy of Fascism, rejecting all alliances,
ated that the Government was determined to *Fascisitiz-*
e state, and that if the Opposition did not abstain from
s violence severe repressive measures would be resorted
ese declarations induced Salandra to withdraw his sup-
lthough, like Orlando and Giolitti, he did not retire on
"Aventine;" a part of his group (the Liberal Right)
away and formed the pro-Fascist National Liberals. In
Sig. Roberto Farinacci was appointed general secretary
Fascist party, which he proceeded to reorganise, giving
gidly intransigent character. His speeches and articles
nt the extremist attitude of Fascism.

onal Defence.—The bill presented by the Minister of
en. Di Giorgio, for reorganising the army on the basis of
ction of the peace-time effectives, the sums thus econo-
to be devoted to material, encountered much opposition
tary circles and in the Senate. On April 1 the Premier
ed the adjournment of the debate and appealed to the
s in the Senate to collaborate in improving the nation's
s. Gen. Di Giorgio felt called upon to resign, and Sig.
ini himself took charge of the War Ministry *ad interim*,
en. Cavallero as Under-Secretary; Gen. Badoglio was
ted chief of the staff and entrusted with the co-ordination
army, navy and air force. On May 5 Adml. Thaon di
resigned, and Sig. Mussolini took over the Ministry of
e and the newly created Air Ministry as well, with Adml.
i and Gen. Bonzani as Under-Secretaries. This arrange-
s regarded as leading the way to a future Ministry of
al Defence. A great manifestation in honour of the King's
was held on June 7. It was generally recognised that the
e of the monarchy had been greatly strengthened by the
régime.

Government was rapidly regaining the ground it had
consequence of the Matteotti affair. The decision of the
judicial committee, rendered on June 12 1925, on Sig.
i's charges against Gen. De Bono, acquitted the latter of
n connection with the Matteotti affair and of the other
serious accusations, only certain minor counts being de-
not proven. At the municipal elections of Palermo on
1925 the anti-Fascist list was supported by Orlando,
ad mobilised his adherents in its favour, but the Fascist
ured a large majority. In consequence Orlando resigned
t, declaring that there was no longer a place for him in
political life. His withdrawal from politics made very
mpression, as he had already to a very large extent lost
itical influence. The findings of the prosecuting section
Court of Appeal on the Matteotti case in Dec. 1925,
ommitting Dumini and four accomplices to trial for mur-
cluded premeditation and exonerated members of the
Government and officials from complicity. Cesare Rossi, Marinelli and Filippelli were consequently set free.

The trial of the five men accused of having caused the death of Sig. Matteotti was ended on March 24 1926, at Chieti. Dumini, Volpi and Poveromo were found guilty of non-premeditated unintentional homicide extenuated by the subnormal physical resistance of Sig. Matteotti and by other circumstances; Viola and Malacria were found not guilty. The sentence on Dumini, Volpi and Poveromo was 5 years 11 months and 20 days penal servitude of which 4 years are remitted under the recent amnesty and one year and 9 months were already served in awaiting trial. They had therefore to serve only 2 months and 20 days imprisonment.

Financial Reform.—In the spring of 1925 financial difficulties had arisen resulting in the serious depreciation of the lira, which fell from a little over 100 to the £ to close on 150; this was partly due to the heavy excess of imports over exports in consequence of the bad harvest of 1924, but also to speculation initially promoted by certain members of the Opposition who hoped to break Fascism through a financial disaster and the consequent panic in a part of the public, which believed that the Government intended to reduce the currency to zero after the example of Germany. The measures enacted to restrain speculation aroused much opposition in stock exchange circles and caused a temporary suspension of operations. Prof. De Stefani subsequently modified the regulations, but the Premier felt that a bold treasury policy was now necessary, requiring the services of a practical financier. De Stefani's great task in reorganising the fiscal system and balancing the budget was accomplished; for 1924–5 a surplus of 209 millions was announced, which eventually rose to 417 millions. In July he resigned and was replaced by Count Giuseppe Volpi, Governor of Tripoli, and formerly a business man of wide experience.

The American Debt.—After enacting new regulations, which effectively restrained illicit speculation and improved the currency (the lira rose to 120 to the £) he undertook the settlement of the War debt to the U.S., which was weighing heavily on Italian finance. On Oct. 22 he sailed for Washington, accompanied by Dino Grandi, Under-Secretary for Foreign Affairs, the manufacturer Pirelli, the banker Alberti and the diplomat Count Bonin Longare; on Nov. 14 an agreement was concluded whereby Italy's debt, originally $2,148,000,000, was reduced to $2,042,000,000 to be spread over 62 years, which, calculating the interest at 5%, reduces the actual value of the debt to $360,000,000 (a reduction of 82%); as the interest to be paid amounts to $73,000,000 the total to-day (1926) is $433,000,000. Five millions were to be repaid in each of the first five years, thereafter $20,000,000 till the 30th year, and $50,000,000 for the remainder. The agreement was ratified by the U.S. senate on April 21. A loan floated by the American banks for $100,000,000 to enable the Government to stabilise the exchange was subscribed several times over, while other loans for public works and the railways were also successfully floated in New York. On Jan. 27 1926 Count Volpi signed with Mr. Churchill an agreement in settlement of the Italian War debt of £610,000,000, whereby Italy contracted to pay an annual sum of £4,500,000, slightly reduced at first, over a period of 62 years. The first payment of £2,000,000 was made in March 1926.

The Government undertook several important reforms in the field of internal legislation with the object of giving a more essentially Fascist character to the state. In order to bring Southern Italy up to the standard of the more progressive North a series of measures were enacted for co-ordinating agricultural land reclamation, drainage, the building of roads and railways, etc., for which adequate funds were provided and a suitable civil service organisation created. The wheat crop of 1925 had beaten all records, amounting to 64,000,000 quintals (the pre-War average was 49,000,000), but Mussolini was determined to spare no efforts to increase the output until the 75,000,000 annually required by the population could be grown at home, thereby avoiding heavy payments abroad; all forms of encouragement to producers were adopted and various agricultural measures enacted, constituting what was known as "the battle for wheat."

Fascist Legislation.—Of the political Fascist measures the following are the most important:—

In order to eliminate the influence of Freemasonry in the administrative and political life of the country often inspired by foreign interests, a law was enacted in Dec. 1925 whereby all associations are obliged to communicate their statutes and their membership lists to the authorities, and, should secret societies continue nevertheless to exist, civil servants are forbidden to belong to them on pain of dismissal.

The law of Jan. 31 1926 provides that Italians living abroad who commit acts calculated to promote sedition in Italy or injure Italian interests shall be deprived of Italian citizenship, and in the graver cases even of their property.

The Government is empowered up to Dec. 31 1926 by the law of Nov. 1925 to dismiss from the public service officials who commit overt acts against the state and existing institutions or attempt to prevent the enforcement of the laws or to frustrate its policy.

The conditions of certain municipalities also called for reform. That of Rome, owing to the heavy charges entailed by the fact that it is the capital, could not defray expenditure out of the local revenues alone and constantly had to call upon the Government to make up the deficit; moreover it appeared desirable that the city should not be the scene of political wrangles and party conflicts. Consequently by the law of Oct. 28 1925, instead of an elective mayor and town council, a governor of Rome was created, to be appointed by Royal decree, assisted by two vice-governors, 10 *rettori* and an advisory council of 80 *consultori* to be selected from lists presented by the various economic, professional and educational bodies and certain other associations.

The law of Feb. 4 1926 provides that communes of less than 5,000 inhabitants, where municipal affairs were often run for the benefit of the mayor and assessors and their families, shall be administered by a *Podestà* appointed by royal decree, assisted by an advisory council of *consultori;* a *podestà* can also be appointed for five years in larger communes where the elective council has been dissolved twice in two years.

The authority of the prefects is strengthened with a view to co-ordinating the various provincial services (law of March 1926), while the advisory provincial economic councils are created (law of March 1926) to assist the prefects and the Government in all matters of an economic character composed partly of ex-officio and partly of elective members. The law of Dec. 24 1925 conferred greater power of Parliamentary initiative on the Prime Minister and otherwise extended his authority; it also provides for the infliction of penalties for committing offences against him.

Labour Tribunals.—The most important measure of all is the law of April 3 1926, whereby the labour corporations are recognised and invested with the right of legally representing the various categories (employers, workers, employees, professional men, landlords, peasants, experts, etc.), and all labour conflicts are referred to the labour tribunals attached to courts of appeal; strikes and lock-outs are declared illegal and persons promoting them or participating in them are liable to penalties; the original draft of the bill provided that recourse to these tribunals should be voluntary in industrial conflicts, and obligatory only in those concerning agriculture, and Sig. Benni, president of the Industrial confederation, supported this distinction, whereas Sig. Rossoni, president of the labour syndicates, insisted that such recourse should be obligatory in both cases. Sig. Mussolini intervened in the debate with a powerful speech. After he had taken a day for reflection, he decided in favour of Rossoni's view, which was then accepted even by Benni himself, who withdrew his objections.

Although most of the "Aventinians" continued to remain absent from the Chamber, the groups led by Salandra and Giolitti were present, together with Orlando's followers and the Communists and a few stray Aventinians who had begun to drift back and the Communists; the latter took part in the debates and an amendment proposed by one of them was adopted. The unity of the Aventiniani was gradually breaking up through internal dissensions and personal jealousy. The general internal situation continued to improve, although affrays between Fascists and anti-Fascists occurred from time to time. The most serious of these was the attack on Sig. Amendoli, (*q.v.*) near Montecatini, in the summer of 1925, and the outbreak in Florence on Oct. 3, when as the result of the murder of the Fascist provincial secretary Luporini by a leading Freemason, the latter and two Communists were murdered by Fascists, and the shops and offices of several persons supposed to be Freemasons wrecked. The affair was most regrettable, but it had been voked by the anti-Fascists, and the persons responsible, wh Fascists, or opponents, were all apprehended, and while t charged with murder were awaiting trial before the assizes lesser offenders had already been tried and condemned. prosperity of the country and the absence of unemploy have greatly weakened the Oppositions, many of whose mem as well as many dissident Fascists have shown a tendenc abandon their uncompromising attitude, and not a few applying for the Fascist *tessera*, but the party directorate rigid in their refusal to readmit them. In March 1926 Farin who had been counsel for the defence of Dumini in the Matt trial, resigned from the secretaryship of the Fascist party. was succeeded by Augusto Turati; the party directorate also changed at the same time, and on April 23 it decide admit no new recruits to the party until 1927.

The object of these various measures and of the general p of the Government is to give an essentially Fascist characte the state and its institutions, so that the main principle Fascism, notably the idea of the duty of all citizens tow the state and the necessity that all should co-operate under guidance of the government and of the men best suited the task in every field of activity, for the common good an dignity, prosperity and greatness of Italy, should come t taken for granted by the nation. It is a policy similar to of the men of the Risorgimento who succeeded in getting then novel ideas of the unity and independence of Italy accep by the mass of the people, who had until that time been in ferent or opposed to them. The gradual elimination of opposition was based on the view that an opposition in the s of a reasoned criticism of the Government's policy, which Government itself would have welcomed, did not exist; t were only the survivors of groups belonging to a dead past, hoped by a policy of factious scandalmongering, in alliance the avowedly anti-national groups, to reconquer their old dominance. Hence the lack of interest on the part of the n of the public at their disappearance.

The Plot against Mussolini.—A sensation was caused on N 5 1925 when it was announced that a plot had been discove to murder Sig. Mussolini. The Socialist ex-deputy Zanib was arrested in a room in a hotel commanding the Palazzo C armed with a rifle with which he intended to shoot the Pre while he was taking the salute during the march past of patriotic societies on Armistice Day (Nov. 4). Gen. Cap (*q.v.*) ex-commander of the II. Army, an active Freemason a bitter opponent of the Government, was arrested for c plicity in the attempt. Mussolini was greeted with enthusia demonstrations in consequence of his escape. Another atte on his life was made by the Hon. Violet Gibson, an apparen demented Irishwoman, on April 7 1926, on the eve of his dep ture for Tripoli. The Premier was slightly wounded in the n but proceeded nevertheless on his journey to visit Italy's No African colony.

In the field of foreign affairs a treaty with Egypt was c cluded, whereby the Jaghbub oasis was ceded to Italy, who exchange ceded to Egypt es Sollum. The oasis is import both as the headquarters of the Senussi sect and because dominates the caravan routes between Egypt and Cyrenai by possessing it Italy will be able to prevent the contraband arms from Egypt to the rebel tribes. The question had b long debated between Britain and Italy, and although Jaghb had been promised to Italy, Lord Milner had informed Sena Scialoja in April 1920 that, as in the case of Transjuba, the agr ment would only become effective after a general settlement all the problems before the Peace Conference, thus coupl the Jaghbub question with that of the Dodecanese. As have seen, this connection was rejected by Italy, and Brit had ended by accepting the Italian view, but with the conc sion of independence to Egypt in 1922 negotiations h had to be renewed with that country, and were concluded Dec. 6 1925.

policy of the Fascist Govt. to enforce the teaching of
in the schools of the Alto Adige, and otherwise to give
lian character to this district inhabited by 180,000 to
› Germans, aroused irritation in Germany, and the pan-
n elements voiced by Herr Held, the Bavarian Premier,
ed an agitation against Italy, advocating a boycott of
goods, and accusing the Italian authorities of terrorising
pulation. Sig. Mussolini on Feb. 6 1926 delivered a vig-
speech in the Chamber denouncing this campaign and
g the German Govt. that unless it ceased Italy would not
e to adopt strong measures. This outburst caused wide-
excitement abroad, but it achieved its object. Herr
mann replied in a very minor tone, admitting that the
s of persecution and terrorism were untrue, and this was
ed by a part of the German Press, although the Italian-
of the district was deplored. In Italy Sig. Mussolini's
t received general approval, as it was believed that
spoken to the Germans in the only language which they
tood. The anti-Italian agitation in Germany in fact died
and relations between the two countries had become
than they had been for a long time.

Italian Govt. attached particular importance to a good
tanding with the Balkan States, and on the occasion of
it to Rome of M. Ninchich in Feb. 1926 the question of
ugoslav relations was gone into once more, the conclu-
rived at being that in view of the general state of Europe,
closer collaboration between the two countries than had
ore been realised was desirable. The visit to Rome of the
Minister M. Roufos, while not leading to any definite
was an indication of the cordial sentiments of Greece
s Italy.

year 1925 was proclaimed by Pope Pius XI., an *Anno*
and over 1,000,000 pilgrims flocked to Rome from all
f the world. The Italian Govt. and the Rome munici-
collaborated with the Vatican in organising the transport
pilgrims and in making arrangements for their stay. Im-
ceremonies were held in St. Peter's and the other churches,
rbed by any untoward incident, in spite of the attempts
anti-Clericals and the Freemasons to discourage the
ages. Relations between the Church and the State con-
to improve in spite of occasional misunderstandings,
scist Govt. attaching particular importance to con-
g the Vatican.[1]

II. THE PROBLEM OF DEFENCE

No country, with the exception of India, is protected by nature in the way that Italy is protected by the formidable barrier of the Alps, which not only affords a defence against invasion by land, but also protects her, to a great extent, from attack from the air. By the treaty of peace signed at Vienna in 1866 Italy was denied the full advantage of her natural strategic frontier and Austria was allowed to retain a foothold south of the Alps in the north and east of the province of Venice; throughout the Great War Italy was never able to overcome the advantage which this adjustment conferred on Austria.

As the result of the Treaty of St. Germain Italy, for the first time in modern history, has secured as her political frontier the line that must always be her strategic frontier. The Italian frontier now follows the high Alps from end to end. This frontier, fixed by nature, has been strengthened by diplomacy, for one-third of it is bounded by the neutral and buffer State of Switzerland.

The ethnographical frontier, however, is not identical with the strategic frontier, and Italy now suffers the disadvantage of including within her boundaries about 250,000 Austrians in the Trentino and 250,000 Slovenes in Istria. As an offset to her strong land frontier Italy suffers strategically from a very extended coastline, though with the former great Austrian naval base of Pola now in her hands the Adriatic may almost be considered as a purely Italian sea.

The Military Forces.—The importance which Italy attaches to her military forces is best indicated by her military budget, which for 1924–5 and 1925–6 in millions of lire were as follows:—

	1924–5	1925–6
Army	1,990	2,130
Navy	925	980
Air Force	399	449
Colonial troops	195	252

The above forces are under a Minister of War, a Minister of Marine and a Minister of Air. After the World War, Italy followed the British example in establishing an air force distinct from the army and navy; at first this was under an under secretary responsible to the Minister of the Interior, but in 1925 a Minister for Air was created on an equality with the Minister for War and the Minister of Marine. The three offices were, however, temporarily in the hands of Sig. Mussolini, the Prime Minister.

In 1925 also the appointment of a chief of the general staff was created; this officer, who will be a marshal or general of army, will be responsible to the Minister for War for the army and to the President of the Supreme Commission of Defence (Prime Minister) for everything relating to the execution of the Supreme Commission of Defence and for the eventual operations of war of the three services.

The Regular Army.—The army is now organised in 10 army corps stationed as follows: I. Turin, II. Milan, III. Verona, IV. Bologna, V. Trieste, VI. Florence, VII. Rome, VIII. Naples, IX. Bari, X. Sicily. It will be seen that five of these army corps are stationed in or about the valley of the Po. These 10 army corps consist of 30 divisions, three of three brigades each, 16 of two brigades each, and 11 of one brigade each, making a total of 52 brigades. In addition to the 30 divisions there are three cavalry brigades, three groups of Alpini, each of nine battalions, 12 regiments of Bersaglieri, a tank corps. The length of service in the army is for 18 months. The numbers called up each year are about 180,000. The recruits are called up in May; so between May and Sept. there are therefore

---

the autumn of 1925 Mussolini made speeches of an unmis-
imperial nature. After the Locarno conference he said in
amber at Rome that " while the words of peace glisten on the
I must recognise that the skies have become populated with
ous airplanes and that new and deadly weapons are appearing
he sea." Early in 1926 he went to Tripoli, where he addressed
onial Agricultural Congress, saying " We are hungry for land
we are prolific and intend to remain so. There is no doubt
journey is destined to have profound repercussions on the
f the Italian people, repercussions which will be beneficial
at is our indestructible will." On July 23 he delivered
speech, breathing the same spirit. Although Mussolini has
en very outspoken in his addresses to his own people, he has
nciliatory in his relations with other European powers, and
ready to deny any thought of aggression by force, trusting
o friendly agreement to secure his ends. (ED. *E. B.*)

two classes with the colours, less the number dismissed after 12 months' service (about 60,000); the maximum strength in these months is therefore about 300,000.

The Colonial Army.—The colonial army consists of both Italian and native units, the latter with Italian officers and a proportion of native N. C. O.s. In 1925 the colonial garrisons consisted of 12,350 Italians and 23,000 native troops, of which all except 8,500 were in Tripolitania and Cyrenaica.

The National Militia.—The national militia is the development of the Fascisti militia. In Oct. 1924 this force by decree was declared to be part of the armed forces of the state, took the oath of allegiance to the King, and became subject to the same disciplinary and penal regulations as the regular army. In peace the national militia is directly under the orders of the Prime Minister; on mobilisation such members as are liable to join as reservists are drafted into the army, navy or air force; other militiamen come under the control of the Minister of War. The members of the national militia are all volunteers. The functions of this force embrace co-operation with the army and public security services in the maintenance of internal order and the defence of Italian interests throughout the world.

The militia is divided into two battalions. In 1925 the strength of the 1st battalion was 175,000 and of the 2nd battalion 120,000; the 1st battalion is composed of men who by reason of their occupation or domicile are liable to be called up at any moment. A general calling up of the national militia can only be ordered by the Prime Minister himself.

The Air Force.—This force, which is under a Minister for Air, is subdivided into four portions: An independent air force, which will consist of 78 squadrons; the army air force, which will consist of 57 squadrons; the naval air force, which will consist of 35 squadrons and six airships; the colonial air force, which will consist of 12 squadrons. These auxiliary air forces, although working under the orders of the other services, will depend on the air force in regard to technical matters, administration and promotion.

Munition Factories.—During the World War Italy was handicapped to an extent unknown by other Powers by her lack of raw materials and by the limited capacity of her munition factories, and was largely dependent on the Allies. Her home resources in coal and oil are extremely limited (*see* ECONOMIC HISTORY, below), and she has only very limited quantities of iron ore. During the War she developed her metallurgical industry with great energy and determination; the great works of Ansaldo and Fiat are a remarkable testimony of this development. In the manufacture of aeroplanes, airships and mechanical transport Italy is now in the forefront of manufacturing nations, whilst in regard to armament she is now self-supporting. Although her lack of raw materials must always present an almost insuperable difficulty to Italy, she has remedied this deficiency as far as is possible by exploiting her limited resources and by the development of electrical power. In regard to man power, Italy has no difficulties; her population of 40,000,000, which increases at a rate of 500,000 a year, is ample for her purposes. (J. DU.)

III. ECONOMIC AND FINANCIAL HISTORY[1]

Population.—A remarkable increase of the Italian population took place between 1910 and 1925. The losses due to the War, to epidemics and disasters and to the decrease of births in the years 1916–9, failed to check the increase, since they were balanced by the return of a number of emigrants (estimated at about 1,000,000) while comparatively few, about 363,000 have since left the country. Thus, it is estimated that the 34,600,000 enumerated in the 1911 census, giving a density of 121 to the sq. km. had increased at the end of 1925 to 40,500,000 or 131 to the sq. km. (including the restored territories, which are more sparsely populated than the peninsula), and this in a country two-thirds mountainous or very hilly, poor in minerals and with a soil exploited by some 3,000 years of cultivation.

The birth-rate, like that of most countries, shows a continuous decline since the 'seventies, but infantile mortality has also diminished. The increase in the number of marriages has co pensated for the decrease during the War, but the birth-rate p marriage is only at the pre-War level.

This rapid increase has resulted in the flooding of the labo market. The number of workers between the ages of 16 and is probably about 24,000,000 as against about 20,500,000 1911. The difficulty of absorbing this mass of labour wou have been even greater than it has been were it not for impro ments in industrial equipment, factory organisation, agric tural technique and also the extension of Italian territory. T pressure, however, is increased by the great number of war v tims, who are unable to contribute their full share of work.

[2] 1916–19 for births, 1915–8 for all other columns.
[3] 1919–24 for births, 1920–4 for all other columns.
[4] Excess of live births over deaths.

Emigration.—In 1911 the Italians abroad numbered 5,500,0 including those who had emigrated long before that date b had retained their nationality, and whose children had declar themselves Italians. As the result of a special investigati Savorgnan found that in the 40 years 1872–1913 emigrati had effected a reduction of at least 3,800,000 persons in t natural increase of the population of Italy. During the War t movement naturally slackened. Conscription, and the inte demand for manpower at home removed alike the possibility and the incentive to migration. The total number of emigra in the four years was, in fact, barely three-fifths of the pre-W annual average. With the return of peace began a feverish r abroad, which was at its height in 1920 when those who h returned from the United States during the War realised t if they delayed they might not be able to get back at all. T numbers of those repatriated since 1921 have amounted annua to about half the total number of emigrants. In all probabili the proportion was formerly greater, since nearly all of those Europe and about 55% of those overseas returned for the wint Nevertheless, when a census of Italians abroad was taken in 19 it was found that there were 7,500,000 of them scattered abo the world. For statistics of the movement of population and t restriction of migration to the United States *see* MIGRATION.

The present stream of emigrants differs considerably fr that of 1909–13 in respect of quantity and quality, countries destination and districts of origin. The restrictions introdu by the United States and other countries have not only redu the total number of emigrants, but have tended especially exclude the Southern Italians, whose need for an outlet is gre est. The average of Italian emigrants to North America w about 200,000 for the years 1919 and 1920, and for the yea 1921–5 about 50,000; whereas the yearly quota allowed in 19 was under 4,000.

Percentage Distribution of Italian Emigration

Destination	From N. Italy		From Central Italy		From South Italy	
	1909–13	1922–4	1909–13	1922–4	1909–13	1922-

Countries overseas	10	13	7	5	42	24

---

[1] Note should be taken of the varying value of the lire. Expressed in lire the annual average value of sterling was:

1914	25.35	1920	99.79
1915	27.90	1921	93.91
1916	31.27	1922	91.86
1917	33.03	1923	99.75
1918	30.31	1924	102.14
1919	50.08	1925	121.54

The parity value of the lire is 25.22.

In 1924 France took 201,715 Italians, mainly from North ly, and since the Armistice the annual average has been 126,- o, or nearly double the number employed there in 1914. This te of things is, however, unlikely to continue; the reconstruc- n of the invaded districts is practically complete, and the mand for agricultural workers in the Gironde and the Garonne s now been almost satisfied. In the near future Italians will y be wanted in the industrial regions of Northern France. ter France, the largest market for their labour is the Argen- e Republic; Switzerland, Germany and Austria will assuredly need them as they did in the past. This slackening in the w of emigration has not, however, checked the tendency to increase in the proportion of skilled workers among the emi- ants, and a lessening of the former preponderance of agricul- al labourers.

Percentage of Emigrants

Period	Agri-cul-turists	La-bourers	Brick-layers	Indus-trial Work-ers	Domes-tic Ser-vants	Other occupa-tions
909-13	32	30	12	12	3	11
919	16	13	9	17	17	21
920	26	20	10	22	12	9

PRODUCTION AND INDUSTRY

Agriculture.—Despite considerable fluctuations from 1911 wards agriculture has afforded a profitable occupation to 52 cent of the population, *i.e.*, to 11 millions over 10 years of . Besides food for direct consumption, the products included raw materials of more than half the total of the country's nufactures, indirectly providing occupation for 27·8% of se employed in industry. In the years immediately preced- the War the average annual production was valued at about oo million lire. Soil and conditions vary greatly, ranging m the rich fertility of some parts of Campania and Sicily, ich will grow all kinds of luxury produce, to the moorlands of north or the chalk-hills of Tuscany and the Lucan clays; m the plains of Lombardy and Venetia, where the "special" ps (tomatoes, sugar-beet, hemp, rice, vegetables, fruit) give ood return to energetic and prudent cultivators, to bare pas- es scorched by the sun all through the rainless summers, and rshy lands where the farmer is handicapped by malaria and poverty of the soil. Regions of the most intensive and ex- sive cultivation border on one another; the large estates uated on the gentle slopes which rise from the sea shore to the ls adjoin land divided into thousands of tiny holdings. Next miserable marshlands with neither houses, trees, shade nor ter, may be seen fertile oases with olives, oranges and lemons. These various agricultural regions do not all permit of the util- tion of large capital in the form of machinery, selected seeds, ligree stocks, proper buildings and skilled workers. Where mate and soil are favourable the owner can create a garden; ewhere the struggle is long and hard and the return extremely all. In such areas capital is not the chief need, but the Gov- ment can do valuable work in preventing the damage done by erosion in the mountainous regions and by making roads and aqueducts.

Progress in these directions is slowly being made, though it suffered a set-back during the four years of war, when, owing to the requirements of the army, labour, fertilisers, machinery and means of transport, were all difficult to obtain, and produce was requisitioned at fixed prices which were far too low to compensate for the many months of laborious toil. Faced by all these difficulties and by the necessity of slaughtering large numbers of cattle and cutting down the forests for military requirements, Italian agriculturists have achieved a great feat in surmounting this troubled period without experiencing an excessive diminution of crops, cattle and forests. The greatest difficulties, however, came in the next years, 1919–22, when the effects of the great deterioration of the soil during the War period were felt; the supply of fertilisers was still very scarce, and cultivators suffered from the uncertainty of prices, the constant disputes with the wage-earners, and the high costs of transport. But these troubles ended at last, and the abundant harvests of 1923 and 1925 made ample amends for the former privations.

The increase in production has been obtained with scarcely any increase in the area under cultivation. Much is due to the intensification of effort, to a more generous use of fertilisers. The efforts and sacrifices of the small proprietors, above all the new settlers, were specially meritorious, for the acquisition of the land had often deprived them of most of their savings, with the result that they had to reduce their standard of living to a very low level in order to scrape together their working capital. Superphosphates, nitrates, basic slag, potash and other fertilisers, supplies of which were heavily reduced during the War, are all now being used in greater quantities than in 1913. The import figures of agricultural machinery do not, owing to the changes in the tariff, give a correct index of the increase or decrease in the purchase of farm machinery; it is certain that the home manufacture increased after the War. Irrigation is also making progress, and year by year new schemes are being started; at the same time water-logged areas are being drained by means of electrical power with the result of abolishing malaria as well as improving the fertility of the land.

In 1911 Italy was nearly self-supporting as regards agricultural produce, except in wheat and timber, and the amounts of these imported were almost entirely paid for by the exports of other agricultural products, so that the agricultural balance is really about even. Moreover, the industry is highly profitable; at the average prices current, the gross value of the total produce of the soil is estimated at 41,700 million lire. The total value would probably have to be increased by several hundred million lire if the whole of the peasant production could be brought into the account, for it must be remembered that no less than 87% of the rural proprietors cultivate very small holdings, most of which are less than half a hectare, though 6/7ths of the total agricultural land is being held by 214,000 "large" and "medium sized" and 500,000 "small" owners. But even excluding this supplementary amount, the figure of 41,700 million lire represents an average of 3,180 lire contributed by each agricultural worker over ten years of age; and an average value of 1,467 lire

of heavy produce for each hectare of agricultural or forest land, the lowest regional average being Sardinia with 460 lire and the highest, Lombardy with 2,580 lire.

Industry.—Of the 5,000,000 adults shown by the census of 1911 as occupied in industry, probably not less than a third were not employed in factories; and it must not be forgotten that a number of women and children entered as domestic workers actually help in the manufacture of articles of daily use or in making the numerous local products which reflect Italian artistic traditions, good taste and native skill, and which enter largely into the export trade. Such wares are embroidery, lace, carved furniture and terra cottas, wrought iron and chased metal work, decorative glass, spun glass and mosaics, stamped leather and illuminated vellum, all of which give ample opportunity to skilled workers and are mainly fashioned in small workshops. The multiplicity of such workshops and the extent of the sales to the public show the importance of these crafts.

Evidence of industrial development is generally sought for in the progress of large undertakings where thousands of workers are massed together, and certain branches of heavy industry are usually looked on as providing the best indices of the aggregate national activity. In Italy, however, the scarcity of fuel and of minerals, the difficulties of land transport due to the mountainous nature of the country, and also the special qualities of the working classes, who are not excessively robust, though quick, industrious and intelligent, have led to a preference for the working up of food products, textiles of various kinds, delicate machinery and housing accessories.

The census of industries which was taken on Jan. 10 1911 showed a very large number of undertakings (243,926), distributed throughout the country, the larger units being concentrated in North Italy, the smaller spread over the other parts of the peninsula. The larger units were comparatively few (only one-tenth of the total number—22,413 to be exact—employed more than 10 persons each), but this tenth possessed three-quarters of the aggregate mechanical and labour power. The distribution of the women, who constituted a third of the total number of persons employed, indicates the importance of the textile industries. These have been traditional for centuries in Italy, and were to be found in every valley, while domestic production had not yet disappeared. Next in importance, in respect of numbers of undertakings and employees, came food manufactures, while the steel and engineering industries were making but slow progress.

The War stimulated nearly every branch of industry, and the introduction of the shift system led to the expansion of plant and to new kinds of manufacture in which by-products, formerly neglected, could be utilised. The extraction of iron ore, pig-iron production and steel showed great increases. In addition to arms and munitions the requirements of the army included a vast number of commodities ranging from cloth to canvas, from shoes to motor-cars, from rubber to paper and from chemicals to naval dockyards. All these shared in the boom which followed the cessation of hostilities.

Employment.—After the Armistice a crisis was brought about by the necessity of substituting other industries for those of the War period, and the difficulties of forecasting demands were intensified by the shortage of raw materials, and by a fierce struggle for the control of associated or subsidiary products. With the assistance of industrial exhibitions organised at Milan, Padua and Naples, and of vertical combines which were formed on an extensive scale, the very difficult period of 1919–20 was at length surmounted. The workers' desire for a "new order" which should give them control of the factories, provoked a number of vast conflicts and strikes. In the first year after the Armistice 1,600,000 workers "downed tools," and 2,300,000 in the following year. In the two succeeding years the world crisis made itself felt, and the effects were intensified because, owing to the bad harvests, the spending power of the poorer classes was greatly reduced and the demand for manufactured goods thereby lessened. But in 1922 conditions began to improve; in that year there were less than 448,000 strikers, and the number of unemployed, which in Jan. 1922 had reached the maximum o 607,000, fell in the summer to half that figure and did not ris to any very great extent in the following winter. At the end o 1925, the number of unemployed was still reduced to the very small figure of 122,000. Certain undertakings which had been over-capitalised failed, and this directed attention to the necessity of reducing costs of production, which became of vita importance when active competition was renewed.

Price Level.—The recovery was brought about by the closing of the gap between internal and foreign price levels during 192 and by the diminution in the violence of fluctuations. Prospective costs and profits could then be estimated with less uncertainty. Another contributory cause was the halt in the upward course of wages; in 1921 these were five and a half times higher than the pre-War level, but they fell in 1922, and throughout 1923 and in 1924 remained at barely five times the pre-War figure, *i.e.*, the rise was a little less than that in the cost of living which was nearly six times the pre-War level. But in 192 statistics show a very marked upward trend of the level of wages caused by the ever-increasing cost of living. Imports of raw materials increased, and the mining industry almost entirely recovered.

Heavy Industry.—The production of pig-iron rose to only about a tenth below the 1910–4 average, and less was imported since scrap was being more and more utilised for the manufacture of steel, both by the Martin and electric processes.

	Imports of Principal Raw Materials (thousands of metric tons)			National Production (thousands of metric tons)		
Annual average	Iron and Steel Scrap	Pig-iron	Copper	Iron Ore	Pig-iron	Iron and Steel
1910–4	340	230	36	563	369	973
1915–8	212	243	74	829	407	1,150
1919–21	102	146	42	427	130	740
1922	306	136	46	311	158	1,046
1923	434	132	50	341	236	1,219
1924	538	201	58	219	304	1,359
1925	958	265	66	. .	. .	1,600

A still greater expansion of the steel industries was hindered by the scarcity of minerals and of coal, the inferior physique of the workers and the difficulties both of organising vertical combinations and of maintaining their efficiency. Hence the preference of the Italians for industries where these drawbacks are not felt in the same degree; such are the building industry, the making of cement blocks and the preparation of foodstuffs for which there is abundant demand. Tanneries and stocking factories have greatly increased in number and capacity, and their products, like those of automobile works, are very largely exported. The film and armament industries have fallen to a very low level, the results of which are especially felt in the redeemed provinces where they were formerly of great importance. On the other hand, beet sugar is being produced in 53 factories as against a little over 30 in 1911, and the production, which averaged 1,700,000 quintals in the five years preceding the War, has lately reached 2,750,000 quintals; it is true that in 1925 the amount fell to the 1910 level, but the set-back is merely temporary. As soon as the stocks accumulated during the boom period have been sold off, the beet area will certainly be extended both in Emilia and the Veneto, where four-fifths both of the cultivation and of the manufacture are carried on. In Campania about half of the preserved vegetable foodstuffs are made, of which the annual value is about 368,000,000 lire, and three-fifths are exported.

Textiles.—As regards textiles, the woollen branches of the industry seem on the whole to have made most progress; larger quantities of raw material are being consumed, and certain processes are being undertaken which were formerly not attempted in Italy. Washing and combing are no longer done almost entirely abroad, thanks to the improvements in machinery and equipment which have been made since 1915, especially in

Annual average	Raw silk production	Exports		Production		Imports	
		of raw silk[2]	of cotton, spun and woven	of electric power	of lignite	of coal	of petroleum, benzene and residual products
	(kilogrammes)	(kilogrammes)	(quintals)	(in million kilowatts)	(tons)	(tons)	(quintals)
910–4	4,780,000	7,193,400	538,800	2,300	654,000	9,940,000	1,387,000
915 8	2,492,000	4,720,000	586,000	3,200	1,540,000	682,000	2,260,000
919–21	3,600,000	4,740,000	575,000	4,100	1,335,000	645,000	2,310,000
922	3,990,000	4,410,000	390,600	4,300	946,000	8,838,000	2,911,000
923	5,233,000	5,180,000	587,900	5,400	1,133,000	9,134,000	3,489,000
924	5,563,000	5,440,000	775,500	6,000	1,048,000	11,221,000	3,767,000
925[1]	. .	6,370,000	800,000	7,600	. .	10,500,000	4,250,000

The whole year.
Considerable quantities of cocoons are imported—hence the excess of export over home production.

edmont and the Vicentino. The silk and cotton manufactures also expanding; better qualities of raw materials are being ed (*e.g.*, Egyptian cotton) and equipment and processes have en modernised and improved. In fine, owing to the cheapness female labour the textile industries have passed beyond the ge of catering for the home demand and for the poorest of the eign markets, and the exports are no longer confined to the arser kinds of fabrics, but include grades of medium fineness. e manufacture of mixed fabrics has been greatly facilitated the increasing development of artificial silk, for which until a v years ago Italy depended largely upon foreign countries.

Motive Power.—An index of the manufacturing capacity of ly is afforded by the figures of consumption of fuel and motive wer; although the Italian mines yield only one-twentieth of country's industrial requirements, the amount of hydro-ctric energy (leaving out of account the periods of interrup-n due to the exceptional drought) is almost three times as at as in 1913 and takes the place of at least 7,000,000 tons of l. In addition, the imports of coal are about the same as in 3, while those of petroleum and benzene have nearly trebled quantity.

Savings.—During the 15 years 1911–25 savings have experienced ious set-backs, especially in the form of deposits in savings in-utions and investments at fixed rates of interest. The effects of netary depreciation have been felt by those who did not wish or not know how to transfer their holdings of fixed interest bearing urities into industrial shares or real estate. The rate of interest bonds has risen from 4% to 6% and over. It is questionable ether the 35·7 milliard lire deposited in various credit and savings titutions in the middle of 1924 represented an equivalent purchas-power to the 7·6 milliard lire similarly deposited in June 1914. view of the rise of prices and diminution in the purchasing power the lira, the deposits in the middle of 1924 were probably equiva-t to about 5·5 milliard lire (pre-War values), but it should be served that current savings are more often invested directly in-ad of through the medium of credit institutions. The issue of h long and short dated treasury bonds, the total of which rose m a few hundred millions in 1914 to 30 milliard lire over a period en the consolidated public debt also trebled in amount, indicates of the many new avenues for savings which formerly found their y into banks and savings institutions. (A still larger field is now ered by industry, for example, the resumption of building after War has absorbed a considerable amount of savings.) It has n estimated that new savings in 1925 amounted to 15 milliard , equivalent to about 2½ milliard lire (pre-War values). The ompanying tables show the amount deposited in savings and credit titutions, the official discount rate, and the number and capitali-ion of joint stock companies:—

Number and Amount of Capital of the Principal Joint Stock Companies at the Beginning of Each Year

Year	Number	Total capital (million lire)	Amount per society (million lire)	Aggregate capital, calculated on the basis of 1913 purchasing power of the lira (million lire)
1913	2,951	5,506	1,870	5,506
1918	3,463	7,257	2,090	6,770
1922	6,075	20,249	3,340	8,975
1923	6,734	21,293	3,160	9,345
1924	7,782	23,421	3,020	10,170
1925	8,946	28,261	3,160	10,402
1926	10,515	36,278	3,450	11,444

Stock-exchange quotations of securities reflect the judgment of the market as to the resources, prospective profits, etc., of each undertaking. When grouped together for each industry the figures provide an index of the general financial forces influencing the different branches of economic activity.

State Securities	96	69	64	66	71	66

Bankruptcies.—The number of bankruptcies, after falling to one-third during the War period and to less than one-seventh in the following three years, rose in 1924 to the level of 10 years previously. As the population has become denser and those engaged in industry and commerce more numerous, this figure may be regarded as normal.

	1914	1918	1920	1922	1923	1924	1925
mounts deposited in the Postal and other Savings Institutions, banks, credit banks and peoples' banks, Monti di pietă, etc. (in millions of lire)	7,595	12,231	20,659	28,316	32,334	35,698	36,000
fficial rate of discount	5–5·50	5–5·50	5–6	6–5·50	5·50	5·50	5·50–7
ate of interest on the public debt (from annual averages)	3·62	5·66	6·62	6·55	5·97	5·28	5·44
ndex numbers of wholesale prices of commodities (R. Bachi) (from annual average)	100	409	624	562	575	585	690

Sales of Property.—The sales of fixed property, which increased in the period of social upheaval and threats of expropriation, continue to be somewhat numerous, owing to the profitability of small holdings and to the break up of the large estates. The very small values of the average transfer indicate a new reduction in size of properties transferred. Allowing for a certain amount of evasion it is possible that this reflects an increase in the number of transfers of small properties for building purposes.

Annual Average	Number of Bankruptcies	Transfers of Fixed Property		
		Financial Year	Number	Millions of Lire
1912-4	7,170	1914–5	343,332	1,006

1924	7,276	. .	. .	. .
1925	7,218	. .	. .	. .

TRADE AND TRANSPORT

The development of Italy's foreign trade has been affected both by the depreciation of the currency and by the increase of her population; allowing for the reduced purchasing power of money, the average value per head of the population was less in 1925 than in the period immediately preceding the War, but was tending to increase.

Directions of Trade.—The directions of both imports and exports show considerable changes, compared with pre-War. Imports from the United States and the Argentine increased by 10 times, only surpassed by Switzerland with a 12-fold increase, while imports from France, England and Germany increased only from three to five times. The extension of Italian exports has been greatest to England, France and Switzerland, followed by Germany, the Argentine and the United States.

Balance.—The adverse annual balance of trade, which was 1·1 milliard lire in 1909–13, rose in 1925 to about 8 milliard lire; against this must be set the expenditure of foreign visitors and the remittances of Italian emigrants, the former being probably of the larger importance. Movements in the values of total imports and exports are given in the following table:—

Foreign Trade 1910–25 (Special Trade)

Year	Imports			Exports		
	Total millions of of lire	Amount per head of pop. in lire		Total millions of lire	Amount per head of pop. in lire	
		a	*b*		*a*	*b*
1910–14	3,381	97	97	2,281	65	65
1919–21	20,123	546	105	8,700	236	45
1922	15,765	404	72	9,302	238	42
1923	17,189	436	76	11,086	281	49
1924	19,388	486	83	14,318	359	61
1925[1]	26,254	648	73	18,277	451	48

[1] The whole year.

(*a*) In lire. (*b*) In lire on the basis of purchasing power.

Transport.—The demands made by the War on both railway lines and rolling stock were very heavy; the length of railways was increased by 1,000 km., while another 1,000 km. were taken over in the restored provinces. On the state-operated lines the number of passengers increased during the last decade by 7%, and since 1922 the volume of goods carried has shown a considerable increase, following on the improvement in railway material and greater security of delivery. The charges both for passengers and for goods have been increased, while the *personnel* has been reduced and the price of coal has fallen from the excessive level of 1921, hence the deficit which arose during the years immediately succeeding the War has disappeared.

The net tonnage of the mercantile marine registered in Italian ports doubled between 1912 and 1924. The losses from submarines and mines were more than replaced by the shipping taken over in Trieste and Istria, and the ships as a whole are faster and more modern than before the War. Though the total weight of goods carried to and from Italy shows no appreciable increase compared to pre-War, a larger proportion is carried in Italian vessels, in spite of the obvious preference of importers from overseas to employ their own vessels.

All this economic development and also the emergence of Milan as a centre of importance in international trade could not fail to be reflected in the figures of the credit clearing-houses. The clearings which in 1913 amounted to 63 milliard lire, rose in 1925 to 1,03 milliards or by 16 times.

Year	Length of the Rlys. Km.	Railways		Tonnage of Mercantile Marine	Shipping		Credit Clearing House Figures
		Railway Traffic			Goods loaded and unloaded at Italian Ports		
		Passengers	Goods		Italian Flag	Foreign Flags	
		(millions)	(mln. tons)	(mln. tons)	(mln. tons)	(mln. tons)	(mlds. of lire)
1913	17,649	94	37	0·87	16·4	15·4	61
1918	19,066	65	29	0·70	7·4	9·4	188

1925	20,907	110	64	. .	21·0	13·2	1030

National Finance.—The revenues of the state were about 2,40 million lire in 1910–1. This was the last of a series of years, beginning 1898–9, in which there was a continual surplus of revenue ove expenditure; from then onwards, first the Libyan War and then th World War occasioned a long succession of financial deficits. Th period 1911–25 falls naturally into four divisions.

1. *1911–2 to 1913–4.*—Owing to the Libyan War expenditure ros by 152 million in 1911–2, by 250 million in 1912–3, and by 18 million in 1913–4, resulting in deficits for the three years of 111 8 257·5 and 163·9 million lire respectively. These deficits do not include sums borrowed by the Treasury, as a result of which th National Debt increased from 15,746·5 milliard lire to 17,080· milliard lire.

2. *1914–5 to 1918–9.*—The War years thus began with a budge which could have been balanced with a very slight effort, and with a public debt of about 17·5 milliard lire. The following table show the increase in public expenditure due to the War:—

Year	Military Expenditure	Civil Expenditure	War Pensions	Total	Revenue	Deficit
	mill. lire	mill. lire	mill. lire	mill. lire	mill. lire	mill. lire
1914–5	3,296	2,099	. .	5,395	2,560	2,835
1915–6	8,317	2,307	1	10,625	3,734	6,89
1916–7	14,069	3,497	30	17,595	5,345	12,25
1917–8	19,142	6,002	154	25,299	7,533	17,76
1918–9	23,280	8,942	229	32,452	9,676	22,77
Total for 5 years	68,104	22,847	414	91,366	28,847	62,51

The expenditure during the War years would have appeared much greater had it not been that many items remained in suspense a burdened the budgets of subsequent years. The increase of civi expenditure was due partly to the rapid rise in the cost of livi which necessitated increased salaries and bonuses, partly to allowances to the families of soldiers and to the refugees from invade districts, partly to the taking over by the state of the administration of the mercantile marine, and partly to the interest on th National Debt, which rose from 530 millions in 1913–4 to 2,6 millions in 1918–9. It was impossible to raise revenue to within measurable distance of such expenditure.

A part of the increase in revenue was automatic, arising as it di from the depreciation of money, and the consequent increase in th receipts from indirect taxation. The resources of the financial administration were greatly strained by the withdrawal of men for th army, by the dislocation caused through inflation, and by the task of collecting the new taxation imposed during the War, such as ne monopolies (matches, playing cards, coffee); a 5% tax on the lettin of houses; the War *centesimo* on incomes above 10,000 lire; the ta on War profits, etc. None of these new taxes brought in any considerable sums to the exchequer, with the exception of the tax on War profits. Framed on lines somewhat similar to those of the exces profits duties of the United Kingdom and the United States, this ta was at first levied by the Royal Decree of Nov. 21 1915 on all profit of the War years in excess of 8%, the rates varying from 10 to 30 this latter rate being applicable to all profits in excess of 20% on th capital invested in the undertaking. The growing feeling against Wa profiteers caused the rates to be raised to from 12 to 35% (decre of Aug. 31 1916), and shortly afterwards to 20 to 60% (decree o Nov. 9 1916). The yield of the tax increased from 108·2 million in 1916–7 to 451·6 million in 1917–8, and 805·8 million in 1918–9.

3. *1919–20 to 1921–2.*—The following table shows that the highes expenditure was reached, not during the War, but during the perio of liquidation immediately after the War.

	Military Expenditure	Civil Expenditure	War Pensions	Total Expenditure	Revenue	Deficit
	mill. lire	mill. lire	mill. lire	mill. lire	mill. lire	mill. lire
19 20	8,085	13,851	1,158	23,093	15,207	7,886
20–1	9,212	25,780	1,236	36,229	18,820	17,409
21–2	6,798	27,114	1,549	35,461	19,701	15,760
otal for 3 years	24,095	66,745	3,943	94,783	53,728	41,055

f the civil expenditure 13 milliards were required for the service he debt, 5·1 milliards for exchange transactions, etc., 3·5 milliards the cost of the merchant shipping services, 5·3 milliards for food plies, 3·1 milliards for deficits on the state railways, 3·9 milliards War pensions, and 6·8 milliards for the reconstruction of invaded restored territories. The costs of all these services were greatly anced by the depreciation of the currency.

ortunately, the fall in the value of the lira also increased the lic revenue, which during the War had varied from 2·6 to 9·7 liards, and which rose in 1921–2 to 19·7 milliards. Part of this rease was due to confiscatory legislation passed under the in-nce of the socialistic and demagogic tendencies which prevailed er the War. A levy was imposed on increments in the values of perty, which ranged from 10 to 80% of the War gain remaining the taxpaper after the payment of the War profits tax. Before s had come into force it was increased by the law of Sept. 24 1920, ich involved a tax of 100% on all the War profits of industrialists l traders. In no country was so high a rate imposed, and during three years of liquidation the yield of the tax reached over 96 million lire. Further, an extraordinary levy on property was posed, which was designed to be a progressive tax on capital, ied at rates varying from 5 to 50%, but owing to the impossibility collecting the whole tax in a single year, it was necessary to spread ver a period of years, fixed, first at 30 and then at 10 to 20 years. Among taxes already in existence the succession duty especially ealed to the new social theorists, and by means of various tech-al modifications and by changes in the method of assessment, s was raised to 30, 50, 80, and, incredible as it may seem, to 103% the amount inherited. At the same time it must not be forgotten t credit is due for the abolition, on the initiative of Signor Giolitti, the disastrous policy of regulating the price of bread, which for itical reasons was sold below cost and threatened to send the ian lira into the abyss after the German mark.

. *1922–3 to 1924–5.*—Expenditure and receipts and the eventual ancing of the budget are shown in the following table:—

Year	Military Expenditure	Civil Expenditure	War Pensions	Total Expenditure	Receipts	Difference between Receipts and Expenditure (+ or —)
	mill. lire	mill. lire	mill. lire	mill. lire	mill. lire	mill. lire
22 3	3,248	16,976	1,608	21,832	18,803	−3,029
23 4	3,704	15,820	1,475	21,000	20,581	− 418
24 5	3,286	15,284	1,453	20,023	20,440	+ 417

Except for the first four months, the period of transition from large icits to the budget equilibrium of 1924–5 took place under the trol of Signor de Stefani, head of the combined Ministry of ance and the Treasury. He contrived to restrict expenditure hin the limits of revenue by gradually eliminating abnormal enditure and by a return to the sound conditions of Treasury trol and supervision of accounts which had been largely abrogated ring the troubled War years. The Italian Treasury has always n accustomed to publish monthly statements of its position, but this has been developed by Signor de Stefani with the result that figures are now published relating to all the various aspects of the economic life of the country. It has not merely been necessary to cut down expenditure, but also to make provision against the disappearance of abnormal War revenues, in particular the tax on War profits and on property. Many relatively unproductive War-taxes were abolished in 1923 and 1924, and the remainder were simplified and given a permanent place in the tax system. Being convinced that certain taxes had been raised to an excessive height, he carried through important modifications and reductions; thus he abolished the inheritance tax on property passing within the family, and reduced it largely in other cases. Again, he reduced to half or less the taxes on land and on factories, and decreed a gradual modification of the rates of tax on incomes from other sources. But at the same time he instituted investigations into taxable incomes in such a way as to bring the taxpayers' returns nearer to the real incomes and to reduce evasion to a minimum. It may be noted that in 1918 the manufacturers, traders and professional persons subject to tax numbered 543,184, and that the aggregate revenue from this source was over 704 million lire, while in 1924 the number rose to 762,137, and the tax yield to about 2,793 million lire. There were also added to the number of direct taxpayers 1,260,090 agriculturists, proprietors, cultivators, and metayers, who in 1923, for the first time in the history of Italy, were subjected to an income tax, the resulting yield being 2,081 million lire.

Public Debt.—The series of heavy deficits during the 10 years 1914–23 inevitably affected the public debt of the state; moreover, the method of partly meeting the deficit by the issue of paper money was, in its turn, a powerful cause of the increase of expenditure and of indebtedness, much of which would not have existed but for the disturbing influence of the issue of paper money. Below is a summary statement of the movements of the Italian State debt since 1911, in millions of lire:—

Italian State Debt (in millions of lire)

	June 30 1911	June 30 1914	June 30 1919	June 30 1922	June 30 1923	June 30 1925	Dec. 31 1925

otes issued by the Government or on Government account	436	490	10,293	10,316	10,192	9,168	9,163
oreign debt at par	. .	. .	19,206	21,615	22,187	23,404	. .

The foreign debt is not comparable with the internal debt, as it was contracted in dollars and sterling, and is here converted into lire at par, *i.e.*, gold lire, which are very different from the paper lire of the rest of the debt.

The internal debt reached its maximum on June 30 1923, which marked the end of extraordinary War expenditure. From then onward the amount decreased, and by Dec. 31 1925 the internal debt had contracted by 2·85 milliard lire. This affords the most significant proof of the improvement in economic conditions, of the growing yield of the ordinary taxes, and of the restriction of expenditure which characterised the long period of Signor de Stefani's control of finance. His successor, Signor Volpi, continued the process of financial reconstruction, and in particular settled the War debts with United States and Great Britain. The agreement concluded with the United States in Nov. 1925 reduced the debt from a nominal value of $2,042,000,000 to a present value at 5% of $430,000,000, distributed over 62 annuities rising from an initial minimum of $5,000,000 to a final maximum of $82,000,000. The agreement concluded with Great Britain in Jan. 27 1926 was set on payments distributed in 62 years, with yearly payments from £4,000,000 and £4,250,000 in the first six years, to £4,500,000 a year from 1931 to 1987. Considering that the national wealth of Italy was estimated at the beginning of the War at 100 milliards lire, and the national income at 20 milliards, it has involved a tremendous burden to maintain War expenditure which in the heaviest years reached 35 milliards, though reckoned in a currency which was continually decreasing in purchasing power.

Currency.—It is not surprising that the Italian economy should still bear the marks of this economic effort, of which the deepest is the decline in the value of money. The table on p. 578 shows the note circulation, the average circulation per head, and the average value of the lira in terms of gold.

During the period of actual fighting, when there was a deficit of 62·5 million lire, which could not be covered by internal loans amounting to 34·6 milliards, and foreign loans of 19·2 milliards, the state was forced to obtain advances from the banks, to the sum of 10·3 milliards, and the lira in consequence depreciated. In 1920 the value of the lira had fallen to 22 gold *centesimi*, and the total circulation had attained its maximum of 22 milliards. In terms of gold the circulation per head of the population increased only from 76·18 to

	Circulation (in millions of lire)			Paper lire per head of pop.	Rate of exchange of the paper lire in gold centesimi (average of the six months preceding and six months following Dec. 31)	Gold lire per head of pop.

112·37 lire or not more than 50% of the increase in countries remaining on a gold standard; but the increase in the *per capita* circulation of paper money was the cause of a profound alteration in incomes and in the burden of taxation. It is estimated that the pre-War national income of 20 milliard gold lire had increased to 100 milliard paper lire in 1924–5. On the former income, the burden of taxation, both central and local, amounted to 2·5 milliards, or 12·5% of the national income, while in 1925, on the same basis, the tax burden rose to 20 milliards, or 20% of the national income of 100 milliards. These two proportions, 12·5% and 20%, reflect the changes in the burden of taxation resulting from the War. When it is considered that this increase in taxation was borne by a population whose average income per head before the War was about 500 to 550 gold lire a year (£20 to £22 sterling), and in 1925 was about 2,500 paper lire (£21 sterling), it is clear that if it was hard to pay 12·5% in taxation of an income of 500 to 550 gold lire, it is exceedingly hard to pay in taxes 20% of incomes of 2,500 paper lire. We may well speak of the heroic efforts of the Italian taxpaper, which have been the product of the War.

(L. E.)

IVORY COAST (*see* 15.98).—A French colony on the Gulf of Guinea. The area is 122,000 sq. m.; the population in 1925 was estimated at 1,400,000, of whom 1,100 were Europeans. From the lagoon port of Abijan a railway, 193 m. long, was opened to Bwake in 1913. Thence a motor road connects with the Upper Volta colony. Besides palm-oil and -kernels, fine woods, including mahogany and ebony, are exported. Forests cover two-thirds of the colony. *See* WEST AFRICA, FRENCH.

IWASAKI, KOYATA, 2ND BARON (1879–), Japanese philanthropist, was born in 1879, and succeeded to the barony in 1909. Educated at the Imperial University of Tōkyō and at Cambridge, England, he became president of the banking department of the Mitsubishi Company. His vast wealth was largely expended in experiments and benefactions. He instituted a research farm in the north of Japan for stock raising. His visit to England convinced him of the educational value of public libraries, and when the library of Dr. G. E. Morrison, for many years *The Times* (London) Correspondent in Peking, came into the market, Baron Iwasaki bought it for the students of Japan. He added to it the bulk of his own collection and in addition to buying a site and erecting a building to contain it, he allotted a sum of money annually to the institution for the purpose of keeping it up to date by the purchase of new books. The library is called the *T¯yō Bunko* (Oriental Library) and is situated in Kamifujimae Chō in Hongō, Tōkyō.

IZVOLSKY, ALEXANDER PETROVICH (1856–1919), Russian statesman, was born at Moscow March 17 1856, of an ancient Polish family which had been settled in Russia for generations. He graduated at the Imperial Lyceum of St. Petersburg (Leningrad) with the highest honours attainable, whereupon he became attaché to the chancellery of Prince Gorchakov. In 1879 he was appointed first secretary of the Russian Legation at Bucharest. After a spell of service in Washington he was charged with the resumption of relations between the Tsar's Govt. and the Holy See, a task which he fulfilled with great tact to the entire satisfaction of his chief, and incidentally won golden opinions of Cardinal Rampolla and Leo XIII. and received the post of Minister-Resident at the Vatican.

About this time he married Countess Toll, a friend of the dowager Empress Maria Feodorovna, to whose influence Izvolsky owed much of his professional success. His next posts, as minister plenipotentiary, were in Belgrade, Munich and Tokio. From the Japanese capital he warned Lamsdorff who was his chief of what was brewing for Russia in the Far East, but his reports on the warlike preparations were shelved as impertinent and ridiculed as absurd. He was next instrumental in having the Marquis Ito sent to Europe (1902) to settle differences with Russia, but the court camarilla in St. Petersburg thwarted all efforts towards an understanding. Two years later Izvolsky obtained from Japan moderate proposals for a friendly accord, which however were also rejected by the Tsar. Before hostilities broke out Izvolsky returned to Europe and through the Dowager Empress' influence became Minister Plenipotentiary at Copenhagen (1903). In the year 1906 he succeeded Count Lamsdorff as Minister of Foreign Affairs, moulding Russia's external relations and influencing the course of her domestic policy, as a Liberal, until the year 1910. From 1910 to 1917 Izvolsky was Russian Ambassador in France and after the revolution he fell ill and died in Paris Aug. 16 1919.

Izvolsky was endowed with more than average talents, considerable powers of observation, refined artistic tastes and a high sense of honour and duty. An omnivorous reader, he could talk interestingly about literature, art and history. But these and other accomplishments were neutralised by his consequential airs, his oracular pronouncements and his disdainful attitude. He carried self-respect to the point of self-worship and preferred stateliness to the close intercourse of friendship, and as he lacked the magnetic personal current which might have covered these defects, hosts of enemies confronted him at every stage of his career, countering his exertions and embittering his life. Few men have been more bitterly attacked than Izvolsky, whose main crime consists in his having practised the code of public morality that obtained in the school of diplomacy in which he graduated.

As the trustee of the Russian Empire in its external relations Izvolsky has no claim to high statesmanship nor indeed to genial gifts of any kind. He was a clever diplomatist—according to King Edward VII., the cleverest in Russia—with a very definite and circumscribed aim which he pursued with unflagging energy, an endless variety of means and untiring perseverance. When he became Foreign Secretary, France and Russia were but nominally allies, each one speculating on the intentions of the other; and the cardinal principle of his policy was to convert that alliance into an efficacious reality. This he did with occidental thoroughness. Hence he strove to draw Britain, Italy, Turkey, Bulgaria and Rumania into the Entente. Accepting as an axiom the inevitability of a great European war, the principal belligerents being France and Germany in the west, and Russia and Austria in the east, he came to the conclusion that between those future enemies there might be episodic arrangements and temporary makeshifts, but that there could be no complete settlement of differences except by the fortune of war.

zvolsky's first success was the liquidation of the war with pan, which he accomplished with remarkable foresight, breadth view, thoroughness and moral courage. His next task was re arduous; the displacement once and for all of the causes of rivalry between Russia and Britain. And it was largely to olsky's personal efforts that the realisation of this plan was e. He began by coming to an arrangement with Britain about rsia, Afghanistan and Tibet (1907). This reconciliation defi- ely baffled Aehrenthal's scheme which the Tsaritza of Russia voured—of a renewal of the Three-Kaiser Alliance.

Soon after this Izvolsky sounded Vienna unofficially as to w Austria would view an attempt by Russia to obtain the edom of the Straits. Aehrenthal, then Minister of Foreign airs, who was still on relatively friendly terms with Izvolsky, ce his residence as Ambassador in St. Petersburg, replied officially that no objection would be raised if Russia on her e agreed to the annexation of Bosnia and Hercegovina. This estion and answer were, however, followed by a marked olness in the mutual relations of the two Empires, and the tter dropped. The two states came together again when arged by Europe to draft and execute a scheme for the reform justice in Macedonia. But Austria secretly obtained from rkey, whose conduct she was supposed to be vigilantly super- sing, a railway concession in the Sandjak of Novi Bazar. In Petersburg, London and Belgrade the news aroused intense dignation. But after King Edward's visit to Reval (June 1908), volsky wrote a letter to Aehrenthal announcing that Russia d no objection to the Sandjak Railway if Austria would assent an Adria Railway for Serbia. At the same time he proposed at the Tsardom should obtain the freedom of the Straits and stria promulgate the annexation of Bosnia and Hercegovina. volsky and Aehrenthal then met at Buchlau, the Moravian residence of Count Berchtold (Sept. 15 1908), and agreed to this arrangement. Izvolsky held that he made the proviso that the two points be referred to a European Conference, while Aehrenthal asserted that he announced the annexation as impending. Both were probably right. A few days later Aehrenthal acting in good faith annexed the two provinces without more ado, whereas Russia was kept out of her *quid pro quo* owing to the refusal of England and France to open the Straits question at that inopportune moment.

After this the relations of the two Ministers became personally estranged and the intercourse between their respective countries grew almost hostile. Indeed war was in sight for a while and was seriously discussed in St. Petersburg, but Russia being unprepared, it was staved off. Izvolsky sought compensation for his diplomatic defeat in bringing about a meeting between the Tsar and the King of Italy at Racconigi (Oct. 23–5 1909) and making the first serious effort to draw Italy into the orbit of the Allies. In spite of this Russia and Germany seemed for a brief while to become friends again and during the Tsar's two months sojourn in Germany Izvolsky was relieved of his office and sent to Paris as ambassador. In this capacity he continued to sway the policy of his country over the head of his nominal chief in virtue of his knowledge, tact and energy.

Izvolsky's strength lay in his resourcefulness in adjusting means to ends and above all in his rare tenacity of purpose. His weakness lurked in a morbid sensitiveness which at time incapacitated him for distinguishing between the satisfaction of personal rancour and the furtherance of national interests. But neither his qualities nor his defects justify the hyperbole that he was responsible for the World War. His policy like that of his Austrian rival is a sequence of cruel illusions for which their respective peoples have had to pay. (E. J. Di.)

JACKS, LAWRENCE PEARSALL (1860–), British Unitarian divine, was born in Nottingham, where he received his early education. Afterwards he studied at London University, and at Göttingen and Harvard. In 1887 he became assistant to Rev. Stopford A. Brooke, at Bedford Chapel, London, and in 1889 he married Brooke's daughter, Olive Cecilia. He was subsequently minister of Unitarian churches in Liverpool and Birmingham. In 1902, on the foundation of *The Hibbert Journal*, Jacks was appointed first editor. In the following year he became instructor in philosophy at Manchester College, Oxford, and in 1915 was chosen principal of that college. Jacks wrote a number of books, of which the best known is his *Life and Letters of Stopford Brooke* (1917); others include *All Men are Ghosts* (1913); *From the Human End* (1916); *From Authority to Freedom* (1920); *The Challenge of Life* (1924); and *The Faith of a Worker* (1925).

JACKSON, HENRY (1839–1921), British classical scholar, was born at Sheffield March 12 1839. He was educated at the Sheffield Collegiate School, at Cheltenham College and at Trinity College, Cambridge, where he was elected fellow in 1864 and vice-master in 1914. From 1875 to 1906 he was praelector in ancient philosophy, and in 1906 was appointed regius professor of Greek, being given the O.M. in the same year. He resigned the vice-mastership of his college in 1919, and died at Bournemouth Sept. 25 1921. His important work in translating and commenting upon Aristotle's *Ethics* is alluded to in 2.513. He published *Texts to Illustrate a course of elementary lectures on Greek Philosophy from Thales to Aristotle* (1901) and a series of articles on "Plato's Later Theory of Ideas" (*Journal of Philology*); also *About Edwin Drood* (1911).

JÄGER, GUSTAV (1832–1917), German naturalist and hygienist (*see* 15.124), died at Stuttgart May 14 1917.

JAMAICA (*see* 15.132), a possession of Great Britain with dependencies in the West Indies. The area is 4,450 sq. m. and the estimated population (1924) 905,363.

Political History.—Immediately after the outbreak of the War (Aug. 4 1914) the legislature raised a Jamaica Volunteer Defence Force. Later it was decided to send a contingent overseas. War contingent funds were raised, and on Nov. 8 1915 the first contingent sailed for England. In all, Jamaica sent 243 officers and 10,168 men, who were enrolled in the British West Indies Regiment, which was formed on Oct. 26 1915 and saw much distinguished service in France, Egypt, Palestine and elsewhere. On March 22 1917 an Act for compulsory military service was passed, but conscription was never actually enforced. The Legislature agreed to pay the whole expenses of her contingents in the form of a contribution to the Imperial Treasury of £60,000 annually, beginning a year after the War. In 1921 the Hon. Edward Wood (now Lord Irwin) visited the Colony with a Colonial Office Mission, and made recommendations for the amendment of its constitution, which are still under discussion.

Fruit.—The chief staples are still fruit, sugar and the raising of stock. Owing to the prohibitive tariff in the United States of America, and the absence of steamers to carry oranges, etc., to the United Kingdom, the citrus fruit industry still languishes. In 1911 the export of bananas reached the record figure of 16,497,385 bunches. Exports, which fell after disastrous droughts and hurricanes in 1915–6–7 to 2,394,514 bunches, recovered, and in 1925 reached 14,896,581. Jamaica, which was not a party to the Canada-West Indies trade agreement of 1912, was a signatory of the agreements of June 18 1920 and July 6 1925. Under the latter, Canada will impose a customs duty of 50 c. per bunch on foreign bananas and admit Jamaica bananas free and will also provide a fortnightly mail passenger and freight service with refrigeration for 70,000 bunches of bananas, alternating with a fortnightly freight service with refrigeration for 50,000 bunches between Canadian ports and Kingston. At present the fruit industry is handled by five concerns, of which all but one carry the fruit to America. In 1925 the planters formed an association, one of whose objects is to secure the establishment of an alternative and independent direct line of steamers to carry fruit of all kinds to England.

Sugar.—Under the Canada-West Indies agreement Jamaica sugar will enjoy the increased preference of $1.00 per 100 lb. on 96° sugar entering the Dominion. In the United Kingdom the preference of British sugar, which was reduced in 1924 to 1s. 8·3d. per cwt. consequent upon the lowering of the duty, was restored in 1925 to 3s. 8¾d. per cwt., and the undertaking was given by Parliament that it would remain at that figure for 10 years. This has helped to establish confidence in the industry. In 1925 the Jamaica Sugar Estates Ltd. was floated with capital of £400,000 and a loan guaranteed under the Trades Facilities Acts to develop sugar production in St. Thomas-in-the-East.

Trade.—The percentage of total exports in 1923 were: Fruit 54·4; sugar 15·8; coffee 5·6; rum 1·2. The area under canes rose to 48,18 ac. in 1924, while that under bananas fell slightly to 74,548 acres. The total volume of trade shows expansion, imports having risen from £2,614,943 in 1910 to £4,827,074 in 1924, and exports from £2,568,222 to £3,122,961. In 1920 imports and exports reached the record figures of £10,313,300 and £7,146,000 respectively. In 1910–1 the colony's revenue was £990,399 and its expenditure £987,304. In 1924 the figures were £1,922,963 and £2,022,746. (*See* West Indies.)

JAMES, HENRY (1843–1916), Anglo-American novelist (*see* 15.143), renounced the nationality of his birth and became a naturalised British subject in July 1915. The act was symbolic of his lifelong love for the country of his adoption, and hardly less of his strong support of British conduct during the World War. It enabled him to be the recipient, in 1916, of the Order of Merit, the crowning official recognition of his distinguished career as a man of letters. James's work after 1911 included a series of informally autobiographical volumes: *A Small Boy and Others* (1913); *Notes of a Son and Brother* (1914); and *The Middle Years* (1917), which give interesting glimpses of his youth and that of William James. Some volumes of essays and prose studies also appeared: *The Ivory Tower* (1917); *Within the Rim* (1919); and *In the Cage* (1919). James died in Chelsea, London, on Feb. 28 1916. A selection from his letters, edited by Percy Lubbock, was published in 1920.

JAMES OF HEREFORD, HENRY JAMES, 1st Baron (1828–1911), British lawyer and politician (*see* 15.144), died at Epsom, Surrey, Aug. 18 1911.

JAMESON, SIR LEANDER STARR (1853–1917), British politician (*see* 15.147). The union of the South African colonies in 1909 accomplished the principal object which Jameson had set before himself as a political leader. He wished to carry the spirit of union further by forming a combination of political parties to support a non-racial government for the new Union, regarded Gen. Botha as the natural leader of such a combination, and was completely ready to serve under him. This project of a "best man" government, however, was not accepted by Botha, who thought that the Dutch-speaking people of South Africa were not ready for it. The alternative, to which Jameson then set himself, was the formation of a new party representing the majority of the English-speaking people in the Cape, the Transvaal, the Orange Free State and Natal. The programme of the new Unionist party of South Africa showed his influence in every clause.

At the first South African general election in Sept. 1910 the Unionists won a considerable measure of success especially in the Cape and Transvaal provinces. Natal, where the English-speaking people were in a great majority, withheld from Jameson the general support which it might have been expected to give.

two years Jameson led the Unionists in the South African ise of Assembly with great moderation and self-restraint, but compelled by ill-health to retire from the leadership of the ty in 1912. He returned to England and settled in London, oting himself, when his health took a turn for the better, to iness interests, but on Nov. 26 1917 he succumbed after a rt illness. Jameson's name will stand very high among those he men who did service to South Africa and Rhodesia. Diffi- t and utterly free from self-seeking, his labours for racial recon- tion and material progress in South Africa were conspicuous, the close friendship of Botha was a final proof of the quality ais patriotism. Jameson was created a K.C.M.G. on the guration of the Union in 1909 and a baronet in 1911.

AMMES, FRANCIS (1868–), French poet and novelist, born at Tournay Dec. 2 1868, and when still a child went ve at Orthez. He studied at the Collège de Pau and the Col- de Bordeaux, and afterwards became for a short time a ary's clerk at Orthez. It was during this uncongenial em- ment that he published his first verses, in 1893. After that e, his poems and novels succeeded each other rapidly. The characteristics of his style are a great simplicity and a ccupation with the quotidian and humble manifestations of He takes great liberties with the alexandrine, which gives poetry a novel and refreshing charm. His works reflect a ipathy for the poor and for animals, and a profound sincerity he painting of French provincial life.

is works are: *Vers* (1893); *De l'Angelus de l'aube à l'Angelus du* (1898); *Clara d'Ellébeuse* (1899); *Le roman du lièvre* (1903); *me d'Anis* (1904); *Clairières dans le ciel* (1906); *Les georgiques tiennes* (1912); *Feuilles dans le vent* (1914); *Le Rosaire au Soleil* 6); *Le curé d'Ozeron* (1918); *Le poète rustique* (1920); *Les s des quatrains* (1923–5); *Ma France poétique* (1926). See also Braun, *Des poètes simples: Francis Jammes* (1900); A. de Bersan- t, *Francis Jammes, poète chrétien* (1910); A. Lowell, *Six French ts* (1915); P. Lasserre, *Les chapelles littéraires* (1920).

ANÁČEK, LEOŠ (1854–), Czech composer, was born in valy, Moravia, and educated in the monastery of the trian Friars in Brno under Paul Křížkovsky. After studies Prague, Leipzig and Vienna he returned to Brno, where in he became director of the organ school, and later professor omposition in the master school of the state conservatoire which the organ school developed. Janáček followed in žkovsky's footsteps as a collector of folk songs, especially of ravia, but went deeper than his master into their psychology. chief characteristics of his works are spontaneity and rich- of colour, together with vigour of idea and expression. hnically, his melodies proceed strictly from the verbal thm, and the orchestra is also assigned the function of a e creative atmosphere than is usual in modern symphonic ompaniments. Among his operatic compositions are *Jönufa: pastorkyňa*, a psychological drama of Moravian village life, produced in Prague 1916; and *Katya Kabanova* (1922), ed on *The Storm*, a Russian drama by Ostrovsky. In lighter od are *The Excursions of Mr. Brouček* (1920), an operatic re, and *Liška bystrouška* (1925), an animal opera. Janáček's aining works include a dramatic song cycle, *The Notebook of who Vanished;* a symphonic poem *The Fiddler's Child;* an nestral rhapsody *Taras Bulba;* a string quartette; a concertino small orchestra; the *Kreutzer sonata* and a sextette *Youth.* F. Bartoš and L. Janáček, *Kytice z rárodních písní moravs- h kterouž uvili F. Bartoš a L. Janáčck* (1890).

ANEWAY, THEODORE CALDWELL (1872–1917), American sician, was born in New York City Nov. 2 1872. He was cated at the Sheffield Scientific School, Yale University, and college of physicians and surgeons, Columbia University. m 1898 to 1906 he taught medical diagnosis in New York versity. In 1907 he became associate in medicine in Columbia versity, and two years later professor of medicine. In 1914 vas called to Johns Hopkins University as professor of medi- , and became physician-in-chief to John Hopkins Hospital. investigations in the phenomena of blood pressure opened up therto unexplored field of medical research. After America's rance into the World War, he became major in the Medical Officers' Reserve Corps and was engaged in research in Washington, D.C. He died at Baltimore, Md., Dec. 27 1917. He was a member of the board of scientific directors of the Rockefeller Institute for Medical Research. He was the author of *The Clinical Study of Blood Pressure* (1904).

JAPAN (*see* 15.156).—An empire of eastern Asia, one of the Great Powers, and a member of the League of Nations. The area, including Formosa, Karafuto (Japanese Sakhalin) and Chosen (Korea) is 262,826 sq. m. and the population (1920) 77,005,510.

I. POLITICAL AND SOCIAL HISTORY

The German Model.—Owing to the necessity of establishing a strong central authority—imposed upon Japan for self-defence as a result of the apparently aggressive policies in the Far East of Western Powers towards the end of the 19th century—and probably from an excess of conservative caution, as the country had just cast off its feudal traditions, the makers of modern Japan often turned to German legislation in seeking for models for the constitution and other laws. But an important factor that should not be lost sight of by students of Japanese politics is that English has long been by far the most extensively studied foreign language among the people. Whilst the static institutions remain more or less Teutonic in form, dynamic inspiration has continuously been drawn from English-speaking sources. That explains why the Japanese understand democracy along the lines of its common acceptation in the English-speaking nations; why the Press and students of politics often advocate the development of a polity somewhat like the British parliamentary system. The political history of Japan in the decade beginning 1910 was the last phase of the struggle between the cause of national security with which *the genros*, the Elder Statesmen, are popularly identified, and the progressive outcry for the emancipation of the people's will. As external dangers diminish, the *vox populi* speaks more effectively.

After the longest tenure of office in the constitutional history of Japan, four and a half years, the Marquis Katsura resigned the premiership in Aug. 1911, " with a view to renovating the spirit of the people. " With the collaboration of Marquis Komura, Foreign Minister, Marquis Katsura had accomplished various financial reforms, the annexation of Korea, and the revision of commercial treaties with Western Powers. Katsura was succeeded by Marquis Saionzi, who had led the Seiyukai party since the retirement of Prince Ito (*see* 15.272). During the premiership of Marquis Saionzi a severe shock was experienced by the whole nation on account of the death on July 30 1912 of the revered and beloved Emperor Mutsuhito. Meiju Tenno, as he was posthumously styled, after the name of the era of his 45 years' reign, was succeeded by his son, Yoshihito Shinno, who ascended the throne at the age of thirty-three.

Fall of the Saionzi Cabinet.—The downfall of the Saionzi Cabinet arose out of the paramount instinct of national self-defence. Before the end of 1912, the establishment of two army divisions in Korea (Chosen) had been tenaciously persisted in by Lt.-Gen. Uyehara, Minister of War. But his colleagues in the Cabinet, as well as the Press, counselled retrenchment and economy. Uyehara resigned, and the Premier sought for his successor. But no soldier would accept the post without a promise by Saionzi as to the two-division increase; and by law a Minister of War must hold the rank of a general or lieutenant-general in the active service. The Premier was constrained to request the Emperor to relieve him of his office. There followed a ministerial deadlock, until Katsura, actuated by chivalrous motives, descended upon the confused arena. He had been created a prince, and had made up his mind to offer the young Emperor loyal but non-political services for the rest of his life in the capacity of grand chamberlain and lord keeper of the great seal.

But the young and care-free generation of Japan had come to assert themselves, and the unconstitutional tendency of the *Genro's* activities had been made the object of popular criticism. The widespread suspicion that he hoped to direct the affairs of state unconstitutionally " from behind the sleeves of the Sacred

Dragon," coupled with his personal failing health, made the path of Prince Katsura's renewed political life immeasurably thorny and arduous. He found the Lower House unexpectedly intractable. Mr. Ozaki's resolution of no confidence caused a tremendous sensation; riotous mobs demolished the offices of *The Kokumin*, a newspaper which had been loyally supporting the ministerial programme. No choice was left to Katsura but to tender his resignation.

Prince Katsura then sought to prove his sincere desire for the constitutional development of the Empire by starting a political party, the *Rikken Doshikai* (the Constitutional Comrades Association). Under this banner there rallied all the members of the Chuo Club, and a majority of the members of the *Kokuminto* (the National party). But Katsura died in the following December. The Yamamoto Cabinet which followed (Feb. 20 1913) was short-lived, owing to the unfortunate "naval scandal," involving the arrest and trial of high officials in the navy, a foreign company having dispensed bribes in connection with the building of a Japanese warship.

Politics During the World War.—After the refusal of Prince I. Tokugawa, and the abortive attempt by Viscount Kiyoura, to form a Cabinet, Count Okuma, the "grand old man" of Waseda undertook, on April 16 1914, to stand at the helm of the Empire, backed by the legacy of Katsura, the *Doshikai;* and Baron Kato, the leader of that party, was entrusted with the portfolio of Foreign Affairs. It fell to the lot of this Cabinet to deal with the invitation of Great Britain to join in the World War under the Anglo-Japanese Alliance. In Nov. 1915 the enthronement of the Emperor was conducted with the time-honoured imposing ceremonies at Kyoto, and the whole nation was *en fête* for seven days in honor of the event.

Count Okuma, in tendering his resignation on account of ill-health in the summer of 1916, recommended Viscount Kato, who had yielded the charge of foreign affairs to Viscount Ishii and was outside the Cabinet, to be his successor. At that moment however, the *Genros* were reported to have intervened, and, in spite of the fact that Kato's new party—the *Kenseikai* (the Constitutionalists), which was an amalgamation of the *Doshikai*, the *Chuseikai* and the Koyu Club—commanded a majority in the Diet, Marshal Terauchi was appointed Premier on Oct. 9. This alleged irregular development excited the hostility, not only of the Kenseikai, but of the general public, and ended in an antagonistic attitude on the part of the Diet towards the new government. Parliament was dissolved, and a general election took place on April 20 1917. The result was a signal victory for the government party, the Seiyukai winning 157 seats, whilst the number of the Kenseikai dwindled from 204 to 117.

Actuated by the desire, in view of the War, to effect unity of all shades of opinions, Marshal Terauchi created the Temporary Diplomatic Investigation Council (*Rinji Gaiko Chosa Kai*), where leaders of all political parties were represented. Kato was invited to join, but refused on the ground that he could not associate himself with the idea of establishing a responsible body for external affairs outside the Cabinet itself. The "rice riot" and the ensuing serious disturbances and strikes, which raged like wildfire in various parts of Japan in the summer of 1918, sealed the fate of the Terauchi Cabinet, which tendered its resignation in the middle of September.

Growth of Democracy.—By that time democratic ideas had been gaining strength on account of the War and internal social unrest. Moreover, the manner in which the Terauchi Cabinet was installed had its inevitable reaction. The people demanded that the next administration should be more in keeping with the spirit of the parliamentary system. Mr. Takashi Hara, the leader of the Seiyukai in succession to the Marquis Saionzi, was entrusted with the task of forming a new Cabinet; he was the first commoner to hold the office of Premier in Japan. The ministers, except those holding the portfolios of war and the navy, were for the first time, a body of party politicians more or less free from the bureaucratic savour which had always clung to the former administrations. Incidentally, a new minister—the Minister for Railways—was included in the Cabinet.

In March 1918, in response to the popular demand, a politi
reform bill was passed, lowering the property qualification
voters to the payment of a direct national tax of three yen i
stead of 10 yen. The number of electors was thus more th
doubled, increasing from 1,450,000 to 3,000,000. The peo
were, however, not satisfied, and popular clamour for univers
suffrage followed. In Feb. 1920 a universal suffrage bill wa
last introduced by the Opposition in the House of Represe
tives. But on the ground that no election on the basis of exten
franchise had as yet taken place, and that consequently it
premature to make any further attempt at suffrage reform,
Diet was immediately dissolved. The nation was called upo
express its opinion on the matter by the general election of M
10. The result was a decided victory for the Seiyukai, the go
ernment party, which secured 280 seats, whilst the Kenseik
registered 110.

Cabinets of 1919 to 1924.—It fell to the fate of the Hara min
try to conclude the treaties of peace ending the World War
1919, and to send delegates to the Washington Conferenc
1921. But before the conference actually began its deliberatio
Hara was assassinated by a misguided and youthful megalom
niac on Nov. 4. Viscount Korekiyo Takahashi, Minister of
nance, succeeded to the leadership of the Seiyukai party and a
sumed the premiership on Nov. 13. There immediately follow
an occurrence of great political moment when the Crown Prin
Hirohito was appointed as Prince Regent on Nov. 25, owing
the continued indifferent health of the Emperor Yoshihito. Ta
ahashi attempted early in the next year the reorganisation
his ministry, which was a legacy from Hara and was not qu
amenable to his leadership. He failed in the enterprise and te
dered his resignation.

Adml. Baron Tomosaburo Kato, who had been Minister
the Navy in the past four successive cabinets and the chief de
gate to the Washington Conference, was nominated Premier
June 12 1922. He had no party affiliations, but had been assur
of the unconditional support of the Seiyukai party; and his
leagues were drafted from the Kenkyukai and the Koyu Cl
of the House of Peers, both of which maintained close conn
tions with the Seiyukai party. The first thing that Kato did a
the assumption of office was to abolish the anomalous institut
of the Temporary Diplomatic Investigation Council. Kato to
upon himself the faithful enforcement of the Washington tre
ties and, in domestic affairs, endeavoured to bring the nation
of the business slump and to cope with the social unrest that h
been gathering strength. However, before he could accompli
much in internal administration, he died on Aug. 24 1923.

The Cabinet resigned on the advice of the acting Premi
Count Uchida, and Adml. Count Yamamoto, who had lived
retirement since his downfall in 1914, was commanded by t
Throne to form a cabinet. Whilst he was busily engaged in t
formation of his ministry, there happened the historic earthqu
of Sept. 1. Late in the evening of the 2nd, the Yamamoto Cabi
was installed with "national solidarity" as its slogan. Ya
moto gathered round him men of long political experience a
recognised ability, and seemed determined to keep aloof fro
party politics. The Cabinet took prompt and effective steps f
the relief of the stricken population, but in considering the r
construction plans had to face dissensions within the Cabin
itself. Viscount Goto's ambitious project was not fully count
nanced by his fellow ministers, and the machinations of th
Seiyukai party further complicated the situation. When an a
tempt on the Prince Regent's life was made by a fanatic on De
27, the Yamamoto Ministry resigned, holding itself answerab
for the outrage.

A ministry was formed on Jan. 7 1924 under the premiershi
of Viscount K. Kiyoura, who was supported by the Kenkyuk
of the Upper House. This was again a non-party administratio
and its marked bureaucratic complexion combined with its appa
ent weakness soon met with popular disapproval as "a cabin
of the privileged class." At the same time the Seiyukai party
that had long been on friendly terms with the Kenkyukai, d
vided into two factions, one avowing its support of its old allies

he other denouncing the irregularity of non-party methods.
former seceded and set to work to form a new party
l the *Seiyu Honto*.

neral Election of May 1924.—Amidst such political develop-
s there intervened the general election of May 10, the result
nich turned out to be a victory for the Kenseikai party with
seats, the Seiyukai obtaining 137, the Seiyu Honto 94, the
gyo Doshikai (Business Men's party) 9, the Shinsei Club 24,
)okokai 21 and non-party 17. It was the first important in-
ce in which the government party failed to win a general
ion.

youra resigned and Viscount Taka-aki Kato, as the leader
e Kenseikai, formed a coalition cabinet on June 11 1924, in-
ng Mr. Korekiyo Takahashi (having renounced his viscounty)
e Seiyukai and Mr. Tsuyoshi Inukai of the Kakushin Club.
Kato administration was made historic by the passage of
niversal manhood suffrage bill on March 29 1925. All males
25 years of age could vote and it was estimated that the
ber of electors would increase fourfold and become about
)0,000. In April 1925 fissiparous tendencies became dis-
ible in the coalition cabinet, when Takahashi resigned his
ership of the Seiyukai as well as his ministerial chair. In
Inukai also announced his determination to retire from
ics. After the succession to the leadership of the Seiyukai of
Baron Giichi Tanaka, the reunion of the Seiyukai
the Seiyu Honto was frequently suggested. The crisis
in July, when the tax reduction scheme invited oppo-
n from the Seiyukai ministers. Kato resigned but was or-
d again to form his Cabinet. On Aug. 2 he again became
nier, with his colleagues composed exclusively of the Kensei-
artisans. Kato died on Jan. 28 1926 and his Cabinet was re-
tructed under the premiership of Mr. Reijiro Wakatsuki,
erto Minister of Home Affairs.

ocial Changes.—The chronological change from the Era of
ji (Enlightened Peace) to the Era of Taisho (Great Right-
ness) in 1912 incidentally marks an important period in the
ural history of the Japanese people. The wars with China
Russia had given them the assurance that their country was
from any foreign aggression, the fear of which had been a
etual nightmare to the founders of modern Japan. Their
iderable achievements in the domains of trade and industry
strengthened their belief in the destiny of the nation. Es-
ally the younger generation, whose cradles were neither
ated by the shapes of armed foreign " black ships " nor del-
l by the overwhelming influx of novel knowledge and strange
oms, were beginning to see that the undigested application of
tern laws and institutions would do more harm than good to
national wellbeing. The question in the mind of young Ja-
was whether it was not the mission of the Japanese people to
te a new civilisation by harmonising and uniting the East
West. The external relations of Japan, too, contributed
r quota to the cumulative change in the mentality of the
ple. Korea was annexed; China started a revolution; Califor-
legislatively discriminated against Japanese; the World War
urred; and Russia turned Bolshevist—all these quickened
ional and social aspirations.

t the beginning of the Taisho Era there was social disquietude
he air. The alleged attempt on the person of the Emperor
iji in 1910—a solitary occurrence in the age-long history of a
al people—the repeated famines in the northeast districts of
an, the disastrous eruption of the Sakurajima volcano, the
id rise in the cost of living, the revelation of naval bribery
ndals, the frequent change of cabinets—these had combined
engender misgivings in the people's minds. When the World
r came, the Taisho era was but two years old. Profiteers
ang up like mushrooms overnight; into the maw of factories
s poured a tremendous army of labour; the cost of living ad-
nced by leaps and bounds; and an age of Western capitalism
s in sight. Public sentiment in Japan was further stirred by
Allied assertions that the War was a democratic crusade
inst the rule of despotism and imperialism. Strikes, which
l long been stifled by restraining circumstances, began to be more and more frequently organised. As a consequence of successful strikes in 1917, no fewer than 417 occurred in 1918, a sudden increase in the occurrence coming in the wake of the " rice riot " started by fisherwomen in Toyama; and in 1919 the number increased to 497, which registered the high-water mark of labour agitation. Since the economic panic of 1920, the prospects of lower wages and unemployment have threatened the labourers, and strikes have come to take a defensive rather than an aggressive complexion. There were registered 282 cases of strikes in 1920; 246 in 1921; 250 in 1922; 270 in 1923 and 333 in 1924. These figures are in striking contrast to the average of 30 cases a year for seven years preceding the World War.

In the meantime, no fewer than 389 labour organisations had been formed by 1922. Until 1920, the Yuai Kai founded in Tokyo in 1912 by Mr. Bunji Suzuki had been the only trade union worth mentioning. It was expanded and renamed the " Nippon Rodo Sodomei " (General Federation of Japanese Labour) in 1921, and is considered the most important. Other large unions include the Government Employees' General Federation (Osaka), the Printers' Association (Tokyo), the Osaka Printers' Union, the Japan Seamen's Union (Kobe), the Kanto Transport Workers' Union (Tokyo) and the Federation of Mechanics' Union (Tokyo). Side by side with labour agitation in industries, tenancy disputes in agricultural districts became increasingly frequent. Local tenants' unions were organised by hundreds in the course of 1920–2, and they were amalgamated in the Japanese Farmers' Union (Osaka) and the Kanto Federation of the Japanese Farmers' Union (Tokyo) in 1922. It is significant that labour leaders, however drastic their theories may be, are generally moderate in practice, and that the General Federation of Japanese Labour passed a resolution in Feb. 1924 that when the universal suffrage bill then under discussion became law its members would effectively exercise their franchise. The law was passed in March 1925, and the Labourers' and Farmers' party was organised on March 5 1926 in Osaka.

Culture.—The rise of naturalism in Japanese literature synchronised with the war with Russia (1904–5), the attendant social changes encouraging men of letters to discard the old shibboleth and to proceed to the free, bold and realistic study of human life and nature. (*See* JAPANESE LITERATURE.)

Pure Japanese style painting has successfully been revived and developed in the hands of great artists like Gaho Hashimoto, Gyokusho Kawabata, Kogyo Terasaki, Taikwan Yokoyama and Seiho Takeuchi. In their works are noticeable traces of influence from Western masters. Works after genuine western canons have also been produced by pioneer artists such as Viscount Kiyoteru Kuroda, Fusetsu Nakamura, Saburosuke Okada, Eisaku Wada and Hiroshi Yoshida. They do not yet command the same respect and popularity as those of the native schools, but with the growth of popular appreciation of such paintings and the increase of buildings of a Western type, with their incidental demand for articles of interior decoration, the future development of the Western school of pictorial art seems assured in Japan. In the field of music, native and Western forms had in the past little or no influence upon each other in Japan. But the visits of great artists like Elman and Kreisler, as well as the popularising influence of phonographs, have aroused love and enthusiasm for Western music among the younger Japanese. How this trend will react upon the old Japanese music is yet to be seen.

The Great Earthquake.—On Sept. 1 1923 (11 hr. 58 min. 44 sec. central standard time) a great earthquake visited Japan. The severest shocks were felt along the coast of Sagami Bay in the districts of Hakone, Odawara, Kamakura, Yokosuka, Yokohama and Hojo, but even such distant places as Kobe and Osaka in the west and Fukushima and Sendai in the east were affected. The tremor that shook Tokyo was of secondary intensity. Scientists conclude that the earthquake was caused by a sudden depression in the bottom of Sagami Bay and a corresponding rise of land on its northeastern coast. Fires following the earthquake destroyed three-fourths of Tokyo (nearly 2,000 ac.), and the whole city of Yokohama, and were mainly responsible for the terrible loss of life.

According to the Social Bureau of the Department of Home Affairs, which published its official report in 1926, the casualties were as follows:—

Place	Killed	Injured	Missing	Total
Affected districts . .	91,344	52,074	13,275	156,693
Tokyo (city) . . .	58,104	26,268	10,556	94,928
Yokohama (city) . .	21,384	10,118	1,951	33,453

According to the Department of Education, the foreign casualties in Tokyo and Yokohama were:—

	Number of foreign residents	Killed	Injured	Missing	Total
Chinese . .	4,647	2,011	600	52	2,663
Other nationalities . .	3,616	146	852	715	1,713

The loss of property has been variously estimated, the industrial bank computing it at 4,800 million yen, consisting of 1,000 million yen for government property and 3,800 million yen for that of the inhabitants.

The earthquake occurred almost without warning. A large number of independent fires broke out at the same time, 122 being counted within 30 min. after the earthquake. Many of the fires were due to the combustion of chemicals, outbreaks in restaurants—it being meal-time when the earthquake occurred—and to the intense heat generated. The fire-brigades were in many cases unable to make use of the water-supply, owing to the damage caused to the water-pipes. In Tokyo the greatest tragedy of the earthquake occurred in the ground (230 ac. in extent) belonging to the Army Clothing Department in Honjo, where 40,000 people took refuge, most of them taking with them their belongings. At four o'clock in the afternoon fire approached this enclosure from three sides, and ultimately the whole 40,000 were destroyed in a furious tornado of flame. Brick buildings fared worst in the disaster; wooden-framed buildings of the European style behaved much better than the native ones; and the seismic value of reinforced concrete buildings was fully confirmed, though even they collapsed when their design was seismically imperfect. About 64% of all the buildings in Tokyo were destroyed.

The earthquake coincided with the Cabinet crisis caused by the death of the Premier Tomosaburo Kato, but emergency relief measures were nevertheless quickly and effectively taken. The requisition of foodstuffs and other relief materials was ordered; and Tokyo, Yokohama and its vicinity were placed under martial law. In the trying circumstances, the stricken population in general showed great courage, fortitude and *esprit de corps*. The army and the navy won the gratitude of the nation by their magnificent services in maintaining order and in re-establishing communications. Foreign countries were not slow in showing their sympathies. Their contributions in money and materials amounted to 27,000,000 yen, the largest share being taken by the American Red Cross, which gave more than $11,000,000. The relief services of the American Asiatic Fleet under Adml. Edwin A. Anderson that came to Yokohama from Dairen, and of the American military contingent under orders of Gen. Frank R. McCoy, were timely and efficient.

Undismayed by the appalling calamity, the Government and people immediately proceeded to the work of reconstruction. The official reconstruction plans of Tokyo and Yokohama were considered by the Reconstruction Council and the Reconstruction Board. Viscount Shimpei Goto, Home Minister and President of the Reconstruction Board, first proposed an ambitious plan for Tokyo with a view to reviving from the ashes an ideal modern city. But the Cabinet preferred a less expensive project, which was again drastically curtailed by the Imperial Diet in Feb. 1924. The plan thus decided upon authorises an expenditure of 468,438,849 yen, spread over six years, ending in 1928, to build new and wider streets, a modern sewage system, canals, bridges, parks and better means of transportation, and further to perfect agencies of social service, such as employment bureaux, day nurseries and infirmaries. In 1925 the population of Tokyo registered 1,995,303 and that of Yokohama 405,999 or 85% a 92% of the pre-earthquake population respectively.

II. FOREIGN RELATIONS

General Survey 1910–25.—Having emerged victorious fr the Russo-Japanese War, Japan was relieved from the long nig mare that Korea might be engulfed in the Russian hegemo and constitute a permanent menace to her national safety; mo over, the wrong done to her by the three-Power intervention wresting from her the natural fruits of her victory in the Chi Japanese War—the Liaotung peninsula—was avenged. But t Russian grip on North Manchuria and Mongolia was not o unabated but, on the contrary, was greatly tightened. Th were even fears of a renewed clash between the former fo Statesmanship, however, counselled Japan and Russia to co to a friendly entente in 1907. A similar understanding betwe Japan and France followed in the same year. Further, the co plicated post-War situation in Manchuria was decisively, if n definitively, disposed of by the Chino-Japanese understandin of 1909. In 1910 and 1916 more definite agreements were reach between Japan and Russia with the view of maintaining the s tus quo of Manchuria. Korea was, in the meantime, made a p tectorate of Japan, and the gradual development of affairs that country led to the final annexation. The Anglo-Japane alliance, which had been not only the keystone of Japan's fo eign relations but the mainstay of the general tranquillity Eastern Asia, was renewed (1911).

Whilst Japan's position in the Far East became thus more less reassuring, the dark cloud of anti-Japanese sentiment on t Pacific coast of the United States loomed up on the horizo China's revolution in 1911, instead of bringing immediate pea and liberty to the citizens of the Celestial Empire, divided t nation into irreconcilable camps, and contributed to the politic instability of the Extreme Orient. This meant an exacting bu den upon the diplomatic wisdom and tact of Japan. Japan wa on the one hand, still seriously considering how to cope with t situation in China and, on the other, how to safeguard Japane residents against discriminatory treatment in the west of Americ when the fateful Aug. of 1914 demanded other decisions.

Japan's part in the World War dwindles into insignificanc face of the stupendous efforts of other great Powers espousin the Allied cause. But she contributed what little she could wi her very limited national strength and resources. Her geograph cal situation, however, afforded her, from the economic poin view, a position of vantage. In pre-War days she was still stru gling in financial straits as a result of her Russian conflict, bu she came out of the World War with overflowing coffers, even these coffers were of modest dimensions. At the Peace Confe ence in Paris, she lost her case on the question of racial dignity but her claims with regard to Shantung and the South Sea Is lands were recognised, and her position among the Great Power was assured. But her immediate outlook in 1920–1 bristled wit difficulties and complexities. China had refused to negotiat on Japan's offer to restore Shantung; the Washington Gov would not agree to the Japanese point of view on the Yap question; several states on the Pacific coast of America wer quite determined to abridge the civil rights of Japanese res dents; Korean malcontents abroad were in a fitful mood of re bellion; the Siberian situation was far from tranquil. Japan' natural path of development was beset with suspicions and mis understandings. In these circumstances, Japan welcomed th Washington Conference of 1921–2 as a fitting opportunity for he clearly to expound her foreign policies. Subsequently, the sum mary exclusion of Japanese prescribed in the American immigra tion law of 1924 dealt a tremendous shock to the Japanese mind the Chinese situation continued to be unsettled; and Russia still remained an international enigma. But the progress of af fairs in Eastern Asia testified to the sincerity of Japan's pro nouncements at the conference table of Washington. Despite the differences which arose over many questions, there has de veloped a conviction that there would be no solution of the problems involved. At Geneva and elsewhere the pacific attitude of Japan was recognised.

PRE-WAR QUESTIONS

nchurian Questions.—Prior to the outbreak of the Russo- nese War, the growing international rivalry for spheres of nce in the Chinese Empire had convinced the interested rs of the necessity of establishing the policy of the " open " and equal opportunities for commerce and trade in that try. That principle was from time to time enunciated by t Britain in the later decades of the 19th century, but it was ved to Mr. John Hay, Secretary of State under President inley's administration, to make its definite pronouncement world. In Secretary Hay's Circular Note addressed to vari- Powers under date of July 3 1900, it was declared that the y of the United States was to assure permanent safety and to China, to preserve Chinese territorial and administra- ntity, to protect all rights guaranteed to friendly Powers by and international law and to safeguard for the world the iple of equal and impartial trade with all parts of the Em- The doctrine was accepted in principle by Japan, Great in, Russia, France and Germany. Japan went so far as to ude specific agreements for its execution with Russia (July 07) and France (June 6 1907). It was, however, understood the spheres of influence already established—Great Britain e Yangtze Kiang valley, Tibet and Weihaiwei; Germany in chow; Russia in Manchuria and Mongolia; France in Yun- were not to be prejudiced by the newly professed principle mmercial impartiality.

e Russo-Japanese War brought about the tenure by Japan Manchuria of a similar position to that which the great West- Powers had held in other parts of China. But " because churia had been the scene of the greatest war of modern s," the world's eye became fixed upon every act of Japan in region in " an exceptionally rigorous scrutiny " and " the ns behaved as though they expected her to live up to a stand- of almost ideal altitude." Meanwhile, China, for her part, nto a mood of impatient irritation on account of the pre- d encroachments upon her sovereignty, and the " rights- ery campaign," clamorously conducted throughout that Em- somewhat strained her relations with Japan in the early part 09 in respect of various questions in Manchuria. However, g. of that year, a series of agreements was reached between wo States by which all those outstanding problems were osed. Among the rest, Chinese sovereignty over Chientao onfirmed, and arrangements about railways, including that e Antung-Mukden line, were effected.

om out of the blue, there came from America a proposal for eutralisation of the Manchurian railways in Jan. 1910. In iew of Mr. Philander C. Knox, Secretary of State, that was calculated to further the principle of the " open door " by ng an end to the abnormal conditions obtaining in Manchu- But Russia and Japan could not accede to the scheme, on grounds that their established rights and interests ought to espected and that they were by no means threatening the ese sovereignty or the " open door " principle. Great Brit- ept aloof, declaring that the question should be settled ng the immediately interested Powers, namely, China, Japan Russia. Nor was the proposal to the taste of China, who re- ed it as a further encroachment upon her sovereignty. She ed that her treaty obligations with Japan and Russia pre- ed her from supporting the American idea. And the proposal hrough. Meanwhile, the Russo-Japanese negotiations as to future attitude in Manchuria and Mongolia came to a satis- ory conclusion and a steadying element was added to the tion in the Far East in the form of an agreement between n and Russia, signed at St. Petersburg on July 4, 1910, r which they pledged themselves to maintain the *status* in Manchuria and to abstain from any unfriendly compe- a in the development of that region. The Russo-Japanese *rochement* was further solidified, in view of the World War, he Convention[1] of July 3 1916, which provided that each of wo countries would not become a party to " any political arrangement or combination " directed against the other and that they would take counsel together for the necessary measures, " should the territorial rights or the special interests in the Far East of one of the High Contracting Parties be threatened." The agreement made greatly for the maintenance of good order in the Orient until the Russian Revolution brought about the drastic change of the whole situation. For later developments *see* paragraph on Washington Conference below.

The Annexation of Korea.—Japan had waged two wars, one against China and the other against Russia, in order to prevent Korea (*q.v.*) from becoming " a dagger pointed against Japan's heart." In June 1905 she established a protectorate over the Hermit Kingdom so as to put a definite end to the wayward and suicidal diplomacy of the Seoul courtiers, but the whole peninsula could not be cleansed of its inveterate political and social iniquities. The hopelessness of real reform under the existing régime had become manifest; and the assassination of Prince Ito by a Korean in Oct. 1909 was the climax.

The Tokyo Govt. thus came to the conclusion that " the responsibilities devolving upon Japan for the due administration of the country (Korea) cannot be justly fulfilled without the complete annexation of Korea to the Empire." The fusion was accomplished by a treaty concluded between the Governments of Japan and Korea on Aug. 22 1910. It was decided that the ancient name of Chosen should be revived in lieu of Tai-Han and in future be officially used. Under the terms of the treaty the Korean Imperial House was assured of high honours and dignities as well as a liberal grant for maintenance. Japan, at the same time, notified the foreign Powers concerned that their treaties with Korea, including those of extra-territoriality, were all annulled; but that, nevertheless, their vested rights and interests would be fully respected; that the tariffs in force in Korea would be maintained for 10 years; that cabotage would be permitted to foreign vessels for the same period; and that the port of Masanpo would be closed for naval reasons, but Shin Wiju or Gishu would be added to the open commercial ports.

The Anglo-Japanese Alliance.—The general changes of situation in the Orient after the Russo-Japanese War, notably the annexation of Korea to the Japanese Empire in 1910, impelled the British and the Japanese Govts. to revise the Agreement of Alliance concluded in 1905. The negotiations in London between Sir Edward (afterwards Viscount) Grey and Baron (afterward Count) T. Kato ended in the renewal of the Alliance on July 13 1911. The important feature of the new agreement was the inclusion of an Article exempting either high contracting party from the obligation to come to the armed assistance of the other against a third party when a general arbitration treaty was concluded between that other Power and a third party (Article 4). At that particular time a treaty of such a description was under negotiation between the British and the American Govts., and it was with the particular object of excluding the United States from the application of the Alliance that Article 4 was inserted.

The general arbitration treaty failed to obtain the consent of the American Senate for its ratification, but the British and Japanese Govts. undertook on several occasions to make it clear that the spirit in which the article was conceived had not on that account been altered in the least. The Alliance of 1911 was to last for 10 years, and, in the absence of a year's notice from either contracting party to terminate the agreement, it would automatically continue in existence, even after July 1921, until such denunciation was made. The World War, into which Japan readily entered on account of the Anglo-Japanese Alliance, ended with the Treaty of Versailles which brought forth the League of Nations. The question was then mooted, though more academically than politically, whether the Anglo-Japanese Alliance would not be in contravention with the letter of the Covenant of the League, and on July 8 1920 the two high contracting parties addressed a joint note to the Secretary-General of the League to the purport that the Agreement of Alliance would in case of its renewal be made to conform to the Covenant in its form. The renewal of the Alliance was discussed at the British Imperial Conference in London in June 1921; and it was then announced that, under the terms of the treaty, it would continue, without definite renewal. But at the Washington Conference, in Dec., the agreement made for a four-Power treaty (America, France, England, Japan) provided for the Anglo-Japanese Alliance being brought to an end.

THE WAR AND THE PEACE

The World War.—No sooner had the World War broken out in 1914 than there took place several exchanges of views between the British and the Japanese Govts. as to possible assistance by Japan in the protection of British trade in the Far East. Japan soon made it clear that she was prepared to take the responsibility imposed upon her by the Anglo-Japanese Agreement of Alliance, should the menace of the Germans to British interests necessitate such a step. It was not long before such a contingency arose, and on Aug. 15 1914 the Japanese Govt. sent an ultimatum to Berlin demanding the immediate withdrawal of the German warships from Chinese and Japanese waters and the surrender of Kiaochow to Japan by Sept. 15, with a view to eventual restoration of the leased territory to China; a week was allowed to the German Govt. in which to make a definite reply. On Aug. 23, the term having expired without any answer being forthcoming from the Kaiser's Govt., Japan declared war against Germany. In coming to this decision Japan remembered that it had been through the machinations of the Berlin Govt. that Germany, France and Russia acted jointly in 1895 in "advising" Japan in the name of peace in the Orient, and not without a hint of force, to retrocede to China the peninsula of Liaotung, which had been won by Japan at a heavy sacrifice of life and treasure and ceded to her under the Shimonoseki Treaty, and further that it was barely two years after that incident that Germany had installed herself at Tsingtao on a flimsy pretext. The Japanese nation welcomed the opportunity of eradicating the German menace in the East which owed its inception to such unfortunate circumstances.

The first part which Japan took upon herself to play after she aligned herself with the Allies was the reduction of the German stronghold in the Far East. Tsingtao, on the bay of Kiaochow, had been converted in the hands of the Germans into one of the most impregnable fortresses in the Orient—the "mailed fist" calculated to intimidate any possible objectors to the Kaiser's imperialist aims. It served at the outset of the war as the only base of operations in E. Asia for the German marauders menacing the Allied trade routes. The five German warships forming the main part of Adml. von Spee's squadron had been running amok, not only in Chinese and Japanese waters, but as far as the South Seas. It was imperative to make these raiders homeless, if they could not be captured or destroyed, and the military and naval operations against the redoubtable base, which was under the command of Capt. Meyer-Waldeck and garrisoned by some 13,000 men, of whom 5,599 were German regulars, were started with the utmost dispatch.

On Aug. 27 the blockade of Kiaochow Bay was declared by the Japanese Navy and Lungkow, 150 m. N. of Tsingtao, was chosen as the point for landing troops. The selection of Lungkow as the spot for disembarkation had been agreed upon between the Japanese and British commanders, who saw the necessity of clearing the hinterland prior to the landing of troops at some point nearer the fortress. However, the point being outside the zone of the leased territory, it was thought necessary to have a war zone established, following the precedent of the Russo-Japanese War and negotiations with that view were started between the Japanese and the Chinese Govts. as early as Aug. 20. An understanding was soon come to between the two Governments, and the Peking Govt. issued a declaration establishing such a war zone on Sept. 3. The Chinese Govt., in the meantime, intimated to the Japanese Govt. that it might nevertheless be found advisable to enter a formal protest to Japan against her troops' landing at Lungkow, for the sole purpose of exonerating themselves from all responsibility towards the German Government. Upon Germany's strong protest against permitting the Japanese troops to land in the neutral territory, the Chinese Govt. went so far as to point out that Germany herself had in a measure created the uation through her unauthorised fortification of Tsingtao. an account of the actual operations and the taking of Tsing by the Anglo-Japanese forces, *see* TSINGTAO, CAPTURE OF.

Although Tsingtao was thus early captured, there still remai the important task of locating and disposing of Adml. von Sp squadron, consisting of the "Scharnhorst," the "Gneisen the "Nürnberg," the "Leipzig," and the "Dresden," w were seriously menacing the Allied commerce in the South S It had further been reported that several German warships at large in the Pacific Ocean. As early as Aug. 26 the battle ser "Ibuki" and the cruiser "Chikuma," and shortly a wards six more Japanese cruisers, were ordered to join the Bri China Squadron under the command of Adml. Jerram. T were further dispatched a squadron of eight cruisers to the C and the East Seas and two squadrons—one comprising two ba cruisers, two cruisers, and a division of torpedo destroyers the other one battleship and two cruisers—to the South Pa Ocean. The cruiser "Idzumo," which happened to be in M can waters, as well as the "Asama" and the "Hizen," entrusted with the patrol of the western coast of America co-operation with the Canadian "Rainbow" and the Bri cruiser "Newcastle."

In the middle of Sept. a great sensation was aroused by dramatic appearance in the Bay of Bengal of the German ra "Emden," which had effected her egress from Tsingtao be the blockade was instituted by the Japanese navy. Several ish merchantmen fell victims to her ruthless attack in appali swift succession, and it was only after two months' stren chase by the British and the Japanese squadrons that the " den" was sunk by the Australian cruiser "Sydney" near island of Cocos. In the meantime, Australian and New Zeala troops were being hurried to various theatres of war in Euro and Japanese warships assisted in the convoy of the transp across the Indian Ocean. At one time, whilst the "Emden" still working havoc in Indian waters, the "Ibuki" was oblig to convoy no fewer than 38 troopships by herself. Apart f the anxious as well as hazardous task of convoy, Japanese ships were, in Feb. 1915, called upon to hurry to Singapore land troops there to assist the British forces, side by side French and Russian marines, in suppressing a mutiny of In soldiers who had come under German influence. In 1917, an ter, the Japanese Navy undertook the guardianship of the sa of the Indian Ocean as far as the Cape of Good Hope. Von Sp squadron, as a result of the concerted operation of the Brit and the Japanese navies, was chased in the direction of C Horn towards the end of 1914, and on Dec. 8 was encountere Adml. Sturdee's squadron off the Falkland Is. and was comple annihilated, with the exception of the "Dresden," which, h ever, was also sunk by the British off Chile three months la Meanwhile the German gunboat "Geier" was disarmed and i terned at Honolulu, and thus the Pacific Ocean was cleared of enemy, greatly to the relief of Allied commerce.

The next, and not the least important, contribution of the Ja anese Navy toward the successful conduct of the War, was t sending of the cruiser "Akashi" and three destroyer divis under the command of Rear-Adml. Sato to the Mediterran The German submarine warfare was about that time begin to be carried on in a ruthless manner, and the British Navy h been earnestly requesting Japanese help. Whilst the Britis French and Italian forces were engaged in blockading the A atic Sea and the Dardanelles, Adml. Sato's squadron assum the all-important duties of convoying Allied vessels to and f between ports in the Mediterranean. The Japanese destroye successfully escorted 21 British warships, as well as 623 Britis 100 French, 18 Italian and 26 other troopships or merchantme totalling 788 ships, and they cruised altogether 220,000 miles.

The Peace Conference.—At the Peace Conference in Paris 1919 Japan was represented by Marquis (afterwards Prin Saionzi; Baron (afterwards Viscount) Makino; Viscount (afte wards Count) Chinda; Mr. (afterwards Baron) K. Matsui; an Mr. (afterwards Baron) K. Ijuin. The plenipotentiaries went t ce with the firm conviction, as Baron Makino had made un- ikably clear before he left Japanese shores, that the attitude pan at Paris should be, not so much to advance her own case e the comrade nations in the War, as to take counsel with in the creation of a new world in which justice and humanity d reign supreme and which would assure an enduring e. The first claim laid on the peace-table by the Japanese ates was for the recognition of racial equality. The public on of Japan demanded that, if a new era of righteousness airness was to be established and peace and good-will among were to be assured for all time, one of the postulates should e principle of the equal dignity of races. The Japanese na- had been deeply conscious of the discriminatory treatment d out to its nationals in various parts of the world. It recog- l that differences in ability, power and character among men ys exist; but it appeared wrong that there should be inequality pportunities—inequality before the law. The present state man civilisation having been achieved by a series of social, ious, political and economic emancipations, it seemed cer- y to be time that racial emancipation should, in the interests ie real progress of civilisation, be foreshadowed and ap- ed at least in principle. The original Japanese proposal for tion in the Covenant of the League of Nations read:—

> e equality of nations being a basic principle of the League of ons, the High Contracting Parties agree to accord, *as soon as ble*, to all alien nationals of the states members of the league l and just treatment in every respect, making no distinction, r in law or in fact, on account of their race or nationality.

explaining the Japanese position, Baron Makino made it r that "the question being of a very delicate and complicated ire involving the play of a deep human passion, the immediate isation of the ideal equality was not proposed, but that the se presented enunciated the *principle* only and left the actual king of it in the hands of the different Governments con- ed." Every national of the States in the League was expected share military expenditure for the common cause and, if need sacrifice his own person. In view of these new duties . . . ing before him . . . each national would naturally feel, and in demand, that he be placed on an equal footing with the peo- whom he undertook to defend even with his own life." The anese proposal, which was later somewhat modified in termin- y in an attempt to meet objections, obtained 11 votes out of n its favour, but it was ruled that unanimity was necessary. an abided by that decision, reserving the right to raise the ques- again at an opportune moment.

iaochow.—The disposition as regards Kiaochow was the next stion with which the Japanese delegates had to grapple. When Japanese people gave a hearty send-off to their plenipoten- ies, they had no shadow of doubt as to the final issue of this stion. The greater, therefore, was their disappointment, if not pefaction, when the Chinese delegates came out with a de- nd for the direct restoration of the ex-German stronghold. an claimed Kiaochow in recognition of all her military and al services. It was at the same time made clear that Japan uld be content, having once secured Kiaochow in her hand, to retain it in her possession, but to offer it to China as a mark good will and friendship. The Chinese delegates, however, isted that the declaration of war by China against Germany on g. 14 1917 had abrogated all her treaties with Germany, in- ding that of the lease of Kiaochow. Whether a lease treaty is a sort of *pacta transitoria* is, it was argued, a moot question; vould appear to be contrary to common sense to contend that aper declaration of war could as if by a magic wand trans- to her possession a formidable fortress which China could er have reduced with her own resources. China's further a was that her engagement of May 1915 had been made under ess and was therefore null and void. It is a fact, however, t China did not question the validity of that engagement, en she willingly concluded the formal understanding of Sept. 1918, which was actually based on the above-mentioned agree- nt of May 1915, and accepted an advance of 20,000,000 yen ler that understanding. The position of Japan, it should be observed, had furthermore been fortified by the previous undertakings of Great Britain, France, Russia and Italy in 1917, to support or at least raise no objection to the Japanese claim. The Supreme Council finally decided in favour of Japan, on May 5 1919 (Arts. 156–158, Treaty of Versailles).

The ex-German islands in the Pacific lying north of the equator, which had been under the Japanese occupation since 1914, were allocated to the Japanese administration under mandate at the Supreme Council held at the Trianon Palace on May 7 1919. They include the Marshall, Caroline, Palau (Pelew), and Marianne (Ladrone) islands.

THE RENDITION OF KIAOCHOW

With the coming into force of the Treaty of Versailles on Jan. 10 1920 the German rights and interests in Shantung passed to Japan, and the Tokyo Govt., in conformity with their obligation to China, and true to their public avowals (by Baron Makino in Paris on May 4 1919; by Viscount Uchida in Tokyo, May 17 and Aug. 2 1919), immediately instructed Mr. Obata, the Japanese Minister, to invite the Peking Govt. to open negotiations for effecting the restoration of the ex-German possessions in Shantung Province (Jan. 19). It was desired that the necessary preparations for accepting the restoration should forthwith be started, and that China should organise a police force to take over the charge of guarding the Tsinan-Kiaochow railway. As soon as such an organisation was completed—even were it prior to an agreement being reached as to the restoration—the Japanese troops would be immediately withdrawn. Three months passed without any response coming from Peking in reply to the Japanese overtures.

Japan repeated on April 26 her desire to start negotiations, and the Chinese reply (May 22) was that she could not conduct direct negotiations with Japan as to the question of Kiaochow on the basis of the Treaty of Versailles, which she did not sign, and further, that the whole public of China had assumed a strongly antagonistic attitude regarding this question; whereupon the Tokyo Govt. asked the Chinese Govt. to reconsider the matter, assuring the latter that they were ready to begin negotiations at any time China might deem convenient. But Peking again remained deaf, and at the first assembly of the League of Nations, in 1920, Dr. Wellington Koo reserved for "a more appropriate time in the future" the matter of bringing before the League certain "subjects of vital interest to China, affecting international relations."

Independently of the Washington Conference, an informal conversation regarding Shantung was started between the Japanese and Chinese delegates to that conference on Dec. 1 1921, through the personal good offices of Mr. Charles E. Hughes and Mr. Arthur Balfour (afterwards Lord Balfour). After a protracted discussion, especially in respect of the disposition of the railway, a treaty was signed on Feb. 6 1922 under which the restoration of the former German leased territory to China was finally agreed upon. For five months, beginning June of the same year, negotiations as to the execution of the treaty were conducted in Peking, and in Dec. all detailed arrangements were concluded. The administration of Tsingtao was transferred to China on Dec. 10; the Japanese garrison was withdrawn on Dec. 17; the Shantung railway changed hands on New Year's Day of 1923; and thus passed into history the 24 years' episode of Kiaochow Bay.

The Yap Controversy.—The council of the League which met in Geneva on Dec. 17 1920 decided upon the statute relative to "C" class mandates, under the terms of the Covenant of the League (Art. 22, 6) and pursuant to the decision of the Supreme Council on May 7 1919, allocating the ex-German South Sea Islands to Great Britain, Australia, New Zealand and Japan. The Japanese Govt. had been contending that, according to their legal interpretation, the principle of equal opportunities for trade and commerce should, under the Covenant, be assured to "C" class as well as to "B" class mandates (Art. 22, 5) (*see* MANDATES). But in view of the importance of unity and co-operation among the Allied nations, Japan gave her assent to the issue of the statutes, on the understanding that that "decision should not be considered as an acquiescence by the Japanese Govt. in the submission of Japanese subjects to discriminatory and disadvantageous treatment in the mandated territories, nor have they thereby discarded their claim that the rights and interests hitherto enjoyed by Japanese subjects in these territories should be fully respected."

To the statute relative to the islands north of the equator which came under the Japanese mandate, " as an integral portion of its territory," the United States took exception, on the plea that the island of Yap should not be included in the islands to be so assigned. It was argued that President Wilson had submitted to the Supreme Council his proposal of having that island internationalised for reasons vitally affecting the world communications, and that its decision, published on May 7 1919, should not be regarded as by any means conclusive. Further, the Washington Govt. declared that they had never ratified the Treaty of Versailles and accordingly were not bound by that instrument in any sense; but the United States should, treaty or no treaty, have a voice in the disposition of the affairs immediately arising from the World War. So far as the status of the island was concerned, Japan's position was that, if the published decision of the Supreme Council were not final, she did not know what she could rely upon as definite finality; the Allied Powers in Europe appeared to support the Japanese view. In the presentation of their case, the American Govt. further stated that " even if Yap should be assigned under mandate to Japan, all other Powers should have free and unhampered access to the island for the landing and operation of cables." Japan contended that " the (cables) question seems to be one which should be freely settled by the nation which has the charge of the place." During the Washington Conference an agreement between Japan and the United States was eventually signed on Dec. 12 1921 by which Japan's authority (as the mandatory Power) in Yap was admitted by the United States, while Japan accorded to the United States full rights and facilities regarding cables and other matters.

European Tour of the Crown Prince.—Japan's age-long tradition was broken when an heir to the throne left his native shores on March 31 1921. Crown Prince Hirohito set forth, escorted by Prince Kan-in and Count Chinda, upon a tour of study and observation in Europe. The battleship " Katori," carrying him on board, called at Hongkong, Singapore, Bombay, Port Said, Malta and Gibraltar, en route to Portsmouth, where she anchored on May 8. The reception by King George V. and the public of Great Britain was most cordial and spontaneous, befitting the alliance uniting the two nations for the past two decades. The Imperial tour subsequently extended to France, Belgium, Holland and Italy, and was everywhere attended with success. The Crown Prince returned to Japan on Sept. 31 1921. The minute reports of his foreign tour which daily reached home had a tremendous and almost historic effect in diffusing international and democratic ideas amongst the Japanese people.

The Washington Conference.—In the early months of 1921, when the renewal of the Anglo-Japanese Alliance and the proposal for universal disarmament were simultaneously discussed in Great Britain and the United States, Japanese public opinion evinced misgivings as to the real motives held by the chancelleries at London and Washington. But when President Harding dispatched his informal invitations for an international conference and his sincerity of purpose was evident, the Japanese Govt. entrusted Adml. Baron (later Viscount) Tomosaburo Kato, Minister of the Navy, Baron Kijuro Shidehara, Ambassador to Washington, Prince Iyesato Tokugawa, President of the House of Peers, and Mr. Masanao Hanihara, Vice-Minister for Foreign Affairs, to represent Japan at the conference on the limitation of armaments. Japan's attitude at the conference was to " place all cards face up on the table," and was considered worthy of great credit for enabling the conference to reach a successful end. Coincident with the disarmament conference, the Shantung conversations (*see* above) were started between the Japanese and Chinese representatives and the settlement of the protracted controversy is deemed a happy product of the harmonious diplomatic atmosphere created by the main conference.

In conformity with the agreements of Washington, Japan co pletely withdrew her garrisons from Hankow in July 1922, fr northern Manchuria in Sept. 1922, from Siberia in Oct. 1923 a from Tsingtao in Dec. 1923. With the scrapping of the sup dreadnought Tosa on Feb. 11 1925 the provisions of the disarm ment treaty were fully carried out, except in the case of t battleship " Mikasa." She was the flagship of Admiral Togo at t battle of the Japan Sea in 1905, and the Japanese people wish to preserve her as a historic memorial. The consent of the sig tory Powers was officially obtained, and the " Mikasa," disma tled, lies in Yokosuka Bay as a floating naval museum.

RELATIONS WITH CHINA

The Chinese Loan Consortium.—A gradual change came ab in the opening years of the 20th century in the general polic toward China of the Great Powers, who had become convinced the fruitlessness of mutual competition; signs also became visi of the altered attitude of Western financiers in regard to the i vestments in that Empire. In 1908, a British and a German ba undertook to finance in common the Tientsin-Pukow railway. 1911, a four-Power group consisting of Great Britain, Germa France and the United States, was formed in connection with t Hankow-Szechwan railway loan, as well as the loan for curren reform in China and industrial enterprise in Manchuria. Jap nese and Russian bankers agreed to joint this Consortium in 19 with the understanding that the special interests of Japan a Russia in Manchuria and Mongolia would not be interfered wi in the internationalisation of the Chinese loans. With the inau uration of Mr. Woodrow Wilson as President in 1913, the U Govt. decided to withdraw their bankers from the Co sortium, and subsequently the World War prevented Germa from remaining in the financial league. In 1917 the Consortiu now comprising the four Powers, Great Britain, France, Jap and Russia, invited the United States to rejoin in its activit The American Govt. hesitated at first to respond to this ca but in June 1918 took the initiative for the reconstruction of t financial group.

By that time the Tsarist régime in Russia had come to an en but the other nations interested expressed their assent to t American proposal; and negotiations were started in May 19 in Paris, between the financial representatives of Great Britai France, Japan and the United States, simultaneously with t Peace Conference. After considerable interchange of views, pa of which concerned the reservations by Japan as to S. Manchur and E. Inner Mongolia, an agreement was signed in New York o Oct. 15 1920. The most important feature of the new agreeme was that the object was purely and simply economic, being e tirely free from any political complexion. All the members we to pool their existing and future loans (*i.e.*, options) both as r gards industrial and administrative undertakings, with the excep tion of the industrial enterprises upon which substantial progre had already been made. As to Manchuria and Mongol the Powers arrived at a satisfactory understanding, Japan wit drawing her previous reservations. The statement of the Japa nese Govt. issued on April 1 1921 contained the assuranc that Japan only desired in those regions definitely to ensu " her national defence and the security of her economic life and she was confident that she could safely rely upon the mutu trust and friendship of the Powers in regard to the exigencies o any situation that might arise in future.

Equality of opportunity was fully guaranteed to all membe thus eliminating unnecessary and harmful competition. It wa believed that this co-operative action of the various bankir groups, which alone could offer the enormous amount of capit necessary for the reconstruction of Chinese economic life and fo the building of sufficient means of communication and transpo tation all over her vast territory, would be in the best interes of the Chinese people.

" Twenty-one Demands " upon China.—No country regrette more sincerely the continued internal troubles and disorder i China, which had been divided into warring camps since th Republic was proclaimed, than Japan herself, whose nationa

tiny is so intimately entwined with that of China. On Jan. 1915 the Tokyo Govt., impatient of Chinese diplomacy, sented "21 demands," as they were called. First, China st "give full assent" to Japan's disposal of Shantung and dge herself not to cede or lease either territory or island to hird power under any pretext. Also China must agree to an building a railway from Chefoo to Lungkou, and to the ning of treaty ports by agreement with Japan. Secondly, in th Manchuria and Eastern Mongolia, China recognises an's "special position," and grants to Japanese subjects a t or freedom to reside, own land for trade, manufacture or ing, with important railway concessions. Over China's olitical, financial or military advisers or instructors," in these vinces, "the Japanese Govt. shall first be consulted." Thirdly, Hanyehping Company with its mines is to be made "a t concern of the two nations" in which China shall not "dis- of the rights and property" except "with the previous sent of Japan." Fourthly, "the Chinese Govt. engages not cede or lease to a third power any harbour or bay along the st of China." Group V. of the so-called "demands" was sented secretly as "wishes." By Article I. "the Chinese vt. shall employ influential Japanese as advisers in political, ncial and military matters." The "wishes" also cover employment of Japanese advisers; land ownership by Japa- hospitals, temples and schools; the purchase of munitions of r from Japan; the right to construct the Wuchang-Nanchang d Nanchang-Hangchow railways; the priority of Japanese cap- l regarding railways, mines and harbour works in Fukien prov- e; and Japanese missionary propaganda. The ambitious gramme of the Tokyo Cabinet evoked adverse criticism from ious quarters, and it was unfortunate that whatever cogent sons there might have been, the "wishes" were not placed on table from the outset as well as the "demands." As to their rinsic merit, the London *Times* (Feb. 13 1915) observed: ven in the Peking version . . . these terms do not look harsh or reasonable in principle."

Even granting that some of the proposals were unwisely con- ved, the general belief that Japan purposed at that time to es- lish a veiled protectorate over China was a misconception of true attitude. For Japan it was a matter of superlative erest and importance that her neighbours should attain a good vernment, a prosperous industry and a flourishing trade. For se reasons, Japan pressed the Peking Govt., on May 7 5, to give a definite answer within a time limit. In the end Chinese President, Yuan-Shi-k'ai, acceded to the Japanese posals; and on the 25th of the same month, under the signa- e of Mr. Hioki and Lu Cheng-hsiang, the Chinese Minister Foreign Affairs, two treaties were concluded—one respecting province of Shantung, and the other regarding South Man- ria and Eastern Inner Mongolia—and 13 notes were exchanged. With reference to Shantung, the Japanese Minister, in an ex- ange of notes, made the following declaration:—

> If upon the conclusion of the present War the Japanese Govt. uld be given an absolutely free disposal of the leased ter- ry of Kiaochow Bay, they will return the said territory to China, ject to the following conditions:
> 1. Opening of the whole of Kiaochow as a commercial port;
> 2. Establishment of a Japanese settlement in the locality to be signated by the Japanese Government;
> 3. Establishment, if desired by the Powers, of an international tlement;
> 4. Arrangements to be made, before the return of the said terri- y is effected, between the Japanese and the Chinese Govts. th respect to the disposal of German public establishments and perties and with regard to the other conditions and procedures.

China's Pledges.—By the treaty respecting South Manchuria d Eastern Inner Mongolia, the Chinese Govt. pledged them- ves that the terms of lease of Port Arthur and Dairen, and the South Manchuria railway and the Antung-Mukden rail- y, should be extended to 99 years respectively; the Japanese uld be permitted in South Manchuria to lease land for residential, commercial, industrial and agricultural purposes, and further should be free to enter, travel, reside and pursue various vocations; that in Eastern Mongolia Japanese should be permitted to carry on, jointly with Chinese, agricultural undertakings; that Japanese conducting business in those regions should be submitted to Chinese police laws and taxation; that civil and criminal cases should be tried by the Japanese consul or by Chinese officials according as the defendant was Japanese or Chinese, save in cases of land disputes, where a mixed tribunal would have the power of adjudication (all this pending the eventual reform of the Chinese judicial system); that suitable cities and towns would early be opened to foreigners of China's own accord; and that various agreements relating to the Kirin-Changchun railway should early be revised.

At the Washington Conference of 1921–2 the Chinese delegation asked for the annulment of the treaties and notes of 1915 on the ground that they had been wrested from China under duress and without any *quid pro quo*. Baron Shidehara contended that a dangerous precedent would be established in international law if a treaty were to be revoked for the reason that it had been concluded against the spontaneous will of a party. He declared, however, that, in view of the changes that had taken place in the general situation since the signing of those treaties and notes, Japan was ready to modify some of their stipulations. Mr. Hughes claimed for the Americans all rights granted to Japanese nationals under these documents by virtue of the most favoured nation principle, while refraining from touching upon the validity question. Dr. Koo made a reservation as to China's "right to seek a solution, on all future appropriate occasions, concerning those portions of the treaties and notes of 1915 which did not appear to have been expressly relinquished by Japan."

The Ishii-Lansing Agreement.—In the course of the conversations that took place between Mr. Robert Lansing, the United States Secretary of State, and Viscount Ishii, when the latter went to Washington as Japan's special ambassador on the war mission in 1917, it was found advisable that a public announcement of the desires and intentions of the two Governments with regard to China should once again be made "in order to silence mischievous reports" that had been circulated. On Nov. 2 notes were exchanged declaring in part:—

> The Governments of Japan and the United States recognise that territorial propinquity creates special relations between countries, and consequently the Government of the United States recognises that Japan has special interests in China, particularly in the part to which her possessions are contiguous. . . . The Governments of Japan and the United States deny that they have any purpose to infringe in any way the independence or territorial integrity of China, and they declare, furthermore, that they always adhere to the principle of the so-called "open door" or equal opportunity for commerce and industry in China.

In view of the understandings reached at the Washington Conference of 1921–2, the two Governments declared the termination of the Ishii-Lansing Agreement in the form of notes exchanged between Ambassador Hanihara and Secretary of State Charles E. Hughes on April 14 1923.

JAPAN AND RUSSIA

Japanese Expedition to Siberia.—After the Russian revolution in 1917 an anomalous situation developed in Siberia owing to the contact established by German and Austro-Hungarian prisoners-of-war with Bolshevik forces, the former assuming the practical command. These Teutonic-Bolshevik allies seriously threatened the safety of the Czechoslovak troops who had essayed through the only available route of Siberia to join the Allied armies fighting on the Western Front in France. The U.S. Govt. proposed to the Japanese Govt. in the early part of 1918 to dispatch an Allied contingent to Eastern Siberia to assist the Czechoslovaks. To this Japan gave her assent, and on Aug. 11 1918 dispatched a contingent to Vladivostok; the United States and Great Britain also dispatched troops to Siberia. Early in Sept. Khabarovsk was captured by the Allied forces, and during the month of Oct. Bolshevik influence in Eastern Siberia signally declined, and the Czechoslovaks in the interior

succeeded in re-establishing communication with their compatriots in the littoral districts. The Allied successes in Siberia endowed the anti-Bolsheviks, rallying under the banner of Adml. Kolchak, with fresh power; and the authority of the Omsk Govt., established in Nov. 1918, extended as far as the Ural regions by the end of that year.

But in May 1919 the anti-Bolshevik forces sustained a crushing reverse at the hands of the Red Army; and Adml. Kolchak's Govt. first removed from Omsk and then, toward the winter, to Chita. In the face of such unfavourable developments, Japan saw the necessity of speedily arriving at a definite understanding with the U.S. Govt. as to the future dispatch of reinforcements to Siberia. The Washington Govt., however, responded in Jan. 1920 with a sudden decision to withdraw all the American troops and railway experts; firstly, because the repatriation of the Czechoslovak forces was about to be completed, and secondly because the very unstable situation in Siberia would render futile any military assistance to the attempt to establish an autonomous Russian Govt. in Siberia. The American Govt. further stated that if Japan would continue in her endeavours in Siberia single-handed they had no objection whatever. In point of fact, the exigencies of the situation soon obliged Japan to send reinforcements. But the Bolsheviks were in the spring of 1920 fast establishing ascendancy in Eastern Siberia, having their headquarters at Vladivostok, Verkhne Udinsk, and Blagovyeshchensk—the three centres being more or less independent of each other. After the arrest and execution by Bolsheviks of Adml. Kolchak in Feb. 1920, the only remaining Tsarist leader was Gen. Semenoff, who had established his government at Chita and had the whole province of Trans-Baikalia under his sway.

The Nikolaievsk Massacre.—In March 1920 a most sanguinary incident occurred at Nikolaievsk, on the river Amur; all the Japanese residents of that city, men, women and children, numbering over 700, including Consul Ishida and his family, were tortured and massacred by the "Partisans," a Bolshevist guerilla gang infesting the littoral regions. The Japanese Govt. declared on July 3 that as there existed no responsible administrative centre in Russia which could negotiate concerning this flagrant outrage on Japan's prestige at Nikolaievsk, the Japanese forces would occupy certain places in Sakhalin province, pending the establishment of a legitimate government. At the same time, it was made known that Japanese contingents would soon be withdrawn, as in fact they were, from Trans-Baikalia, inasmuch as the Czechoslovak troops had been successfully assisted on their homeward journey (the last troops left Vladivostok in Sept. 1920), but that Vladivostok and Khabarovsk would still have to be garrisoned by a small military force. Upon inquiry from the Washington Govt., it was explained by the Japanese Govt. that Vladivostok was the prolific hatching ground of Korean revolutionary plots, and further that the safety of the Japanese residents had to be provided for and that Khabarovsk had a close strategic connection with Nikolaievsk. As soon as signs became visible of the growing stability of Khabarovsk, in Sept. evacuation of that region was immediately started.

Meanwhile, the Bolsheviks at Verkhne Udinsk began to style themselves the "Far Eastern Republic," and, in concluding an agreement for the suspension of hostilities with the Japanese military authorities in July 1920, drew up a memorandum to the effect that the Republic would follow democratic and not communist principles of administration, and would constitute itself a buffer state in the interests of a speedy return of peace and order to Siberia. Then the movement for the unification of the several "governments" in Eastern Russia was started, and in Nov. the so-called Amalgamation Assembly at Chita declared the independence of the "Far Eastern Republic" (adopting the name at first conceived at Verkhne Udinsk), holding as its territory the Russian provinces east of the Selenga river and professing anti-communist democracy as its basic political principle. The *coup d'état* which was carried out by the reactionary Kappelists in Vladivostok on May 26 1921 showed that the Siberian situation was still as unstable as ever.

In accordance with Japan's pledge at the Washington Conf ence of 1922, she withdrew her troops from Russian soil exce Northern Sakhalin as soon as the situation warranted the wi drawal, namely by Oct. 25 1923. Northern Sakhalin was evacu ted on May 15 1925, following an arrangement made at the ti of Japan's recognition of the Soviet Government.

Japan's Recognition of Russia.—Geographical propinqui and economic needs made it highly desirable for Japan to establish normal international relations with Siberia as so as the situation warranted such a course. A similar desire w apparently held by the Far Eastern Republic having its capi at Chita, and informal negotiations were conducted betwe the representatives of the Japanese Govt. and the Chita Gov at Dairen in Aug. 1921 and at Changohun in Sept. 1922; but agreements were reached at these conferences. In the meantim the Far Eastern Republic came to be amalgamated with the S viet Union. At the end of 1922 Viscount Shimpei Goto, in t private capacity of President of the Japan-Russia Society, invit M. Joffe to visit Japan for the twofold purpose of recuperati his health and of talking informally about Japanese-Russian lations. Private conversations were carried on between Goto a Joffe in the spring of 1923 (Feb.–May) at Tokyo and Atam Subsequently, the Japanese Govt. officially started the prelim inary informal negotiations with M. Joffe in Tokyo in Ju 1923, with Mr. Toshihiko Kawakami representing it as plenipotentiary.

The conference lasted until July, but owing mainly to the dive gence of views as to the settlement of the Nikolaievsk incider it again failed to arrive at a definite agreement. Then for som months the question of reopening the Russo-Japanese negoti tions remained in abeyance. But in Feb. 1924 Russia invite protests from Japan by successive drastic actions, such as th withdrawal of recognition to the Japanese consuls in Vladivosto and elsewhere, the discontinuation of postal services betwe Vladivostok and Tsuruga, the expulsion of Japanese press corr spondents from Russia and the arrest of Japanese military a consular officials at Vladivostok. It was suspected that, in tak ing such steps, Russia hoped to compel Japan to resume negoti tions at an early date. Mr. Kenkichi Yoshizawa, the Japane Minister at Peking, approached his colleague, M. Karakhan, th Soviet Minister, with insistent demands to make speedy amen for such flagrant irregularities. After several meetings of the tw representatives, it was decided that the thread of discussions a the Tokyo Conference would be taken up by them at Peking May 14 1924. The Peking Conference was protracted to the e of the year, holding no fewer than 77 sessions. At length a "co vention embodying the basic principles of the relations betwe Japan and the Union of Soviet Socialist Republics" was signe on Jan. 20 1925 and came into force on Feb. 26. Through thi convention and the accessory papers,

(1) Japan gave full recognition to the Soviet Union, re-establishi diplomatic and consular relations;

(2) Russia formally tendered Japan "an expression of since regrets" for the Nikolaievsk massacre of 1920, Japan having with drawn her claim for reparations and promising the withdrawal of th Japanese garrison in North Sakhalin by May 15 1925;

(3) In laying down the principles for a future treaty of comme and navigation, Russia recognised the doctrine of private ownersh "to the widest possible extent and on condition of reciprocity;"

(4) It was further agreed that propaganda would not be work either overtly or covertly by the governments themselves or their official agents;

(5) Regarding the question of natural resources, Russia signifie her willingness to grant to Japanese, concessions for the exploitati of minerals, forests and other natural resources in all Russian te ritories. As for oil, Russia pledged herself specifically to grant Japanese concerns the privilege of exploiting 50% in area of the fields already explored or to be explored on the east coast of Nort Sakhalin during the period of five to 10 years. Coalfield concessio on the west coast of North Sakhalin and the Dui district were als pledged;

(6) The fishery rights in Russian waters were granted to Japanes in principle, the private *modus vivendi* of 1924 being recognised;

(7) As for debts and obligations, a settlement was reserved fo future negotiations on condition that the Japanese Govt. an people would not "be placed in any position less favourable" th that which might be accorded to other governments or nationals.

Mr. Tokichi Tanaka went to Moscow as the first Japanese Am-
ssador to the Soviet Union in July 1925, and in company with
a went a Japanese delegation to negotiate with Russian author-
:s regarding Sakhalin concessions. A detailed agreement as to
exploitation was reached in Nov. following, and the founda-
n of Russo-Japanese economic co-operation was thereby laid.

THE EMIGRATION QUESTION

Anti-Japanese Movement in America.—In the opening years
the century, the continuous influx of a large number of Japa-
ıe immigrants from the Hawaiian Islands to California had
ısed much alarm to the labour organisations in that state, and
en in wider circles. Anti-Japanese feeling first overtly mani-
ted itself by the attempted segregation in 1906 of Japanese
ldren in the public schools of San Francisco. President Roose-
t early discerned that public sentiment on the Pacific slope
vards the Japanese was taking an untoward course, and, bent
on stemming the tide in time, in 1906 he pleaded, in his presi-
ntial message to the Federal Congress, that an Act should be
ssed investing the Japanese, who had "won in a single genera-
n the right to stand abreast of the most intelligent and en-
htened peoples of Europe and America," with the right to
turalisation, which had been reserved to "free white persons,
ens of African nativity and persons of African descent." The
ngress at Washington, however, did not, or could not on ac-
ınt of the agitation in the West, so proceed with the ques-
n. Nevertheless, an informal agreement was reached between
: Washington and Tokyo Govts., by which Japan pledged
rself that she would not issue passports for the conti-
ntal United States to those classes of Japanese who would, or
ght, engage in manual labour. Those Japanese who had pre-
ously resided in the United States, or were the immediate rela-
es of Japanese immigrants already in the United States, or
: "settled agriculturists" who were to assume active control
an already established farming interest (only three or four per-
ns actually came under this last category), were to be accepted.
pan promised to observe this arrangement voluntarily, and the
cere efforts of her government in executing it received recog-
ion from many American publicists.

This "gentleman's agreement," as it was generally styled,
s confirmed by a declaration on the part of Japan made simul-
ıeously with the revision of the treaty of commerce and naviga-
n in Feb. 1911. However, the feeling against the Japanese in
: United States subsequently became more and more pro-
ınced. Apart from sporadic legislation imposing restrictions
them with regard to civil rights, such as marriage and the pur-
t of an avocation, the Alien Land Act was passed by the Cali-
nia Legislature in May 1913, and put into force three months
er, despite strong Japanese protests and repeated admonitions
m President Wilson's Cabinet. This law prohibited aliens in-
gible to citizenship of the United States (including companies
: majority of whose interests were under the control of such
ens either in point of their number or the amount of capital
.d) from owning land in the state of California, allowing them
ly the privilege of leasing land on a three years' tenure. The
minology employed invested this law with an appearance of
nocent impartiality, but it was none the less obvious that the
panese alone would, in point of fact, be the sufferers from a
ious discrimination. (The ineligibility to citizenship was
nfirmed by the United States Supreme Court in a decision on
ov. 13 1922.)

Californian Agitation.—American participation in the World
ır tended to lull Californian opposition towards the Japanese.
ıt with the termination of the War it was renewed. In spite
the efforts of the Japanese Govt. to respect the susceptibil-
es of their American neighbours, of which the stoppage of
ssports in the spring of 1920 to the so-called "picture brides"
s an example, the day of the presidential election—Nov. 2—
tnessed the passage by the Californians of the most drastic
v yet enacted against "ineligible aliens," by which they were
prived of even those rights which they had formerly been al-
ved to retain of holding land under a three years' lease. The
Federal authorities had been averse to such a step, but the "initiative" poll decided in favour of the enactment by a majority of three to one (668,483 to 262,086 votes), and the law came into force as from the Dec. following. Thus in 1921 no Japanese might own or lease land, neither could he act as guardian of his own American-born offspring (who are of right American citizens) in whose name land is held, nor might he possess a share even in American-controlled landowning companies.

Anti-alien land legislation seemed to have become the fashion in 1921, the example set by California being emulated by Nebraska, Idaho, Oregon and Washington; the last two states, be it remarked, had systematically refused to make common cause with California during the past decade.

In this connection there would appear to be some misapprehension with regard to the rights of foreigners in Japan to hold land, and it has been stated that no such rights exist. This is not the case, as all persons, without discrimination, who are not Japanese subjects, may enjoy absolute ownership of land, if they are formed and registered under Japanese law as a juridical person, that is, as a partnership or corporation. There are, in fact, many such corporations in existence in Japan, composed exclusively of aliens.

Foreigners are further permitted to acquire rights in land, other than ownership, on the same footing as Japanese nationals, the following being some of the most important of these rights:—

1. *Superficies.*—This is a right *in rem* by virtue of which land belonging to another person can be used for the purpose of owning thereon structures, trees or bamboos. It can be created even though no structures, trees or bamboos are actually in existence on such land, provided that the object and intention are to use the land for the purposes named. The law contains no limitation upon the period of time for which that right can be created; consequently, a superficies for, say, 1,000 years will sell for a sum closely approximating to the value of a right of absolute ownership.

2. *Emphyteusis.*—This is the right *in rem* to carry on agricultural or stock farming on the land of another person. The period of time for its duration is to be fixed by the parties concerned at not less than 20 years and not more than 50 years.

3. *Lease in Perpetuity.*—This is a lease without limit as to its duration, and for all practical purposes it is as good as ownership. It was originally granted to foreigners within the foreign settlements for a nominal consideration paid to the Japanese Government. Although the foreign settlements were abolished in 1898, perpetual leasehold survives and is still enjoyed by foreigners.

4. *Leasehold.*—This is a right *in personam* effective only as between the parties concerned. When registered, however, it can be set up against third persons as the effect of such registration. The duration period is fixed at 20 years, renewable for a further 20 years from the time of renewal.

The climax of the Anti-Japanese movement was reached when an immigration bill containing a clause excluding Asiatics was passed by the American Congress on May 15 1924. A notable aspect of the controversy was that certain senators imparted to Ambassador Hanihara's phrase "grave consequences," an unintended meaning of a "veiled threat." Fears were expressed that the American Congress might suffer the abridgment of its prerogative to legislate about the question of immigration. The Japanese public keenly resented what they considered an overt affront, since they could not reconcile themselves to a proposal under which the Japanese quota would have been a negligible number of 100 immigrants a year. On July 1 the law came into force, and Japanese friendship toward the United States strengthened by the Washington Conference and American generosity at the time of the earthquake disasters, appeared to decline. But thinking Japanese knew that the American press united in disapproving the action of Congress, and felt that this legislation did not correctly reflect the sentiments of Americans as a whole.

J. Toynbee, *Survey of International Affairs 1920–3* (1924), Part VI., “The Far East and the Pacific.”

III. NATIONAL DEFENCE

The Army.—After the Russo-Japanese War six divisions were added to the Japanese Army, making the whole strength 19 divisions and in 1915 two more divisions were established for the defence of Chosen. After the World War it was planned to bring the Japanese military organisation up to the standard of efficiency and equipment necessitated by the lessons of the War. An 18-year reorganisation scheme involving 180,000,000 yen (£18,400,000) was passed by the Diet in 1918, and in 1920 it was decided not only to alter the scheme considerably, but also to expedite its execution and have it completed in 14 years, the estimate passed being 290,000,000 yen (£29,600,000).

Under the new scheme the number of divisions was to remain the same, but as a result of the disbandment of several small units the total peace strength of the army was to be reduced by 56,000 officers and men by 1925, and much of this disbandment has taken place. But, with the evacuation of Hankow and the withdrawal of Japanese forces from Shantung, Siberia and the mainland of Sakhalin, and also from Southern Manchuria, there has been a considerable redistribution of the Japanese Army, which has maintained the total strength of the home forces despite the reduction scheme. In war time this force could be expanded to 41 divisions with a total strength of 1,000,000 all arms. According to the latest budget figures, the total number of effectives in the land forces is 235,056, consisting of 16,879 officers, 216,114 other ranks and 2,063 gendarmerie. A Japanese division, it should be added, is generally composed of two brigades of infantry, one regiment of cavalry, one regiment of field artillery (with the exception of the 9th and 11th divisions, for which a mountain artillery regiment is provided), one battalion of engineers and one battalion of army service.

For the purpose of carrying out the new scheme for military aviation in 1919, the Army Department created an aviation section. In Jan. 1920 a military aviation school was started to train in the first year about 100 students, including both commissioned and non-commissioned officers. The military air service consists of six flying battalions and one balloon corps, and is now equipped with 150 standing machines.

Under the system of conscription, able-bodied males from 17 to 40 years of age are liable for service in the army. Those who have completed the middle school education, or have had an equivalent education, can apply for the volunteer service of one year instead of the ordinary three years' service. A young man who is receiving a liberal education may be exempted from military service until it is finished; residents abroad are also exempted.

The Navy.—As a sequel to the Russo-Japanese War, the Jap nese naval authorities came to the conclusion that the most ef cient fleet unit would be the so-called “8-8 plan;” viz., a un consisting of eight battleships, eight battle cruisers and a suitab strength of subsidiary vessels. The Diet agreed to the scheme principle in 1917, but owing to financial reasons it was decided t start with an 8-4 fleet. In the following year, the Diet passed expanded plan of 8-6 unit, spread over seven years. On accou of the strengthened financial situation, the naval authorities pr posed, in Dec. 1920, an additional appropriation of 751,900,00 yen (£76,990,000) beyond the 408,000,000 yen (£41,700,000) pr viously assigned for warship construction, with a view of con pleting the 8-8 unit scheme in eight years. The Diet gave its as sent to this proposal in passing the Budget for 1921–2, and, ac cording to this plan, Japan was expected to have in commissio by 1927 four battleships, four battle cruisers, 12 cruisers, destroyers, five gunboats, 12 fleet auxiliaries, six minesweeper and several submarines, thus bringing the strength of the Japanes navy in ships not exceeding eight years in age to eight battleship eight battle cruisers, 23 cruisers, 73 destroyers, approximatel 80 submarines, five gunboats, 27 fleet auxiliaries and 120 subma rines. In conjunction with this 8-8 scheme, the expansion of th naval air force was decided upon, and by 1923 the formation 17 service and two practice corps had been completed.

In 1910 the tonnage of the Japanese Navy was 524,273; in 1920 was 769,288. In 1920 its strength was 15 battleships, 7 batt cruisers, 16 light cruisers, 14 coast-defence vessels, 8 gunboats, destroyers, 20 torpedo-boats and about 20 submarines.

In accordance with the agreements at the Washington Conferenc reduction was made in the naval strength of Japan, including the abolition of the 8–8 fleet programme. The “Hizen,” the “Kashima, the “Katori,” the “Ikoma,” the “Ibuki,” the “Kurama,” th “Amagi,” the “Tosa,” the “Atago” and the “Takao” we broken up; the “Satsuma” and the “Aki” were sunk; the “S tsu” was converted to a target ship and the “Akagi” and th “Kaga” to aircraft carriers—all this completed by Feb. 9 19

The naval strength of Japan in 1925 was six battleships (191,3 tons), namely, “Nagato” (1919), “Mutsu” (1920), “Ise” (191 “Hiuga” (1917), “Fuso” (1914), “Yamashiro” (1915); fo battle-cruisers, “Kongo” (1912), “Hiyei” (1912), “Haruna (1913), “Kirishima” (1913); one aircraft carrier (9,500 tons); light cruisers (82,210 tons); 72 destroyers (77,025 tons); 41 su marines (32,838 tons); and two fleet submarines (2,800 tons). the course of building were two aircraft carriers (53,800 tons); ni light cruisers (73,995 tons); nine destroyers (12,960 tons); four su marines (3,659 tons); seven fleet submarines (11,510 tons) an three mine-laying submarines.

Regarding naval aviation, a new programme passed by the Die will give the Japanese Navy when completed 17 fleets and 136 plane stationed as follows: Kosumiga-ura, seven; Yokosuka, five; Saseb three; and Omura, two.

See *Armaments Year Book*, League of Nations (Geneva, 1926).

(H. Sa.)

IV. NATIONAL FINANCE

The State Budget.—The table at top of p. 593 shows the increa ing figures of the Japanese state budget for the fiscal years fr 1910–1 to 1924–5.

Although in the early months of the War the more or less disturb economic conditions in Japan checked the normal increase of reven in general, the gradual recovery, followed by the unprecedent prosperity of industry and commerce, caused the revenue to show a upward tendency. From 1916–7 the yield of income-tax, adjusted t meet national needs, had rapidly increased, and receipts from publi undertakings and state property contributed enormously to th general growth of the revenue. A war profits tax, enacted in 19 required of those liable to the tax the payment of either not less tha 20% of their income in excess of the average profits of pre-War da or, in case such could not be ascertained, of 10% of their invest capital.

In addition to the adjustment of the income tax to yield a lar revenue, the “saké” tax, the postal, telegraph and telepho charges and the price of tobacco (a government monopoly) were increased. Japan emerged from five years of the World War with h financial position considerably strengthened, though during 192 industrial unrest and economic depression reacted adversely national finance. The Government explored every available chan in order to counteract the loss of revenue by retrenchment.

Emergency Expenditure on Account of the Earthquake.—In th middle of the financial year 1923–4, however, as a consequence of th great earthquake, the Government was compelled to provide various emergency measures, the reconstruction of the devasta areas, and at the same time to make good the deficiency arising fr the reduction of taxes or exemption from taxation and other

Budget Figures 1910–25 (in 1,000 Yen)

Year	Revenue			Expenditure			Surplus Revenue
	Ordinary	Extraordinary	Total	Ordinary	Extraordinary	Total	
1910–1	491,331	181,542	672,873	412,009	157,144	569,154	103,719

1920–1	1,174,677	825,975	2,000,652	709,314	650,664	1,359,978	640,674
1921–2	1,283,812	781,899	2,065,711	841,750	648,106	1,489,856	575,855
1922–3	1,428,206	659,139	2,087,345	891,257	538,432	1,429,689	657,656
1923–4	1,303,588	741,464	2,045,052	960,452	560,597	1,521,049	524,003
1924–5	1,265,652	388,458	1,654,110	1,082,400	571,710	1,654,110	. .
1925–6	1,299,321	250,493	1,549,814	1,021,763	528,050	1,549,813	. .

Note.—The figures to the financial year 1923–4 represent the settled accounts; those for the financial years 1924–5 and 1925–6 the budget mates.

ases in revenue. Under these exceptional circumstances the vernment, in order to avoid any serious weakening of the national nces, curtailed expenditure and postponed public works, and so med for the financial year a working budget which amounted to 92,821,754 yen both in revenue and in expenditure. Of this sum fall in taxes consequent on the disaster reached an amount of ,000,000 yen less than the original estimate.

At the 47th extraordinary session of the Diet in 1923 a programme the reconstruction of Tokyo was agreed upon after discussion, and upplementary budget was voted for the purpose; out of the total s voted, 13,180,721 yen was allotted to the fiscal year 1923–4. addition to the above vote for reconstruction a further sum of 83,989 yen was voted to the working budget, so that after these litions the revised working budget for 1923–4 amounted to 11,687,188 yen. The dissolution of the 48th session in Jan. 1924 ving rendered abortive the general budget for 1924–5, the Government drew up a working budget as follows:—

Revenue and Expenditure in Yen

	Revenue	Expenditure
rdinary	1,214,788,272	1,028,156,564
xtraordinary	194,265,814	380,897,522
Total	1,409,054,086	1,409,054,086

The extraordinary expenditure includes the following reconstruction appropriations:—

Expenditure in Yen

econstruction outlay	. .	87,607,000
Tokyo	77,955,000	. .
Yokohama	9,652,000	. .
oans	. .	1,283,000
ubventions	. .	3,816,000
nterest granted for local reconstruction loans	. .	38,000
Total	. .	92,744,000

In July 1924 a supplementary estimate, consisting of the following ounts, was submitted to Parliament and approved:—

	Yen
(*a*) Supplementary expenditure for reconstruction of Tokyo as a consequence of the earthquake	40,400,000
(*b*) Expenditure for reconstruction work on official buildings, and a grant for damage sustained by local authorities	122,300,000
(*c*) Other supplementary expenditure not concerning reconstruction	102,900

Further Emergency Measures.—As a result of the abnormal econom- and financial circumstances, following the earthquake disaster, number of emergency measures became necessary, of which the llowing are the principal:—

(1) Of the 84 Tokyo associated banks, no fewer than 74 had their incipal offices burnt down, with the result that the banking achinery almost ceased to work. An Imperial emergency ordinance as issued on Sept. 7 1923 proclaiming a moratorium of 30 days ithin the stricken area on all pecuniary obligations due on or before pt. 30 1923, under the civil code in force before the catastrophe.

(2) The Bank of Japan having done its utmost to respond to the orementioned measure by accommodating banks with the funds cessary for resuming their business, an ordinance was promulgated Sept. 27 under which the Government undertook to indemnify the bank to the extent of 100,000,000 yen in respect of losses incurred in rediscounting the earthquake bills.

(3) The operation of the customs law was temporarily suspended, and import duties were either abolished or reduced until March 31 1924 (*see* TRADE, INTERNATIONAL).

(4) In the stricken area exemption, reduction and deferred payment of taxes were allowed according to the circumstances.

(5) With the assistance of the deposit bureau of the financial department the Hypothec Bank of Japan and the Industrial Bank of Japan liberally financed their clients.

(6) An ordinance was issued by which state aid was to be given to fire insurance companies which voluntarily paid "sympathy money" to policy holders who suffered loss either directly or indirectly from the earthquake. The subsidy was to be repaid in accordance with terms prescribed by the Government.

(7) A law was promulgated by which an import duty—operative from Aug. 1 1924—of 100% *ad valorem* was placed on luxury and certain other articles.

(8) Reconstruction Savings Certificates were issued in small denominations.

Budget of 1925–6.—In drawing up the Budget for the financial year 1925–6 further retrenchment and reforms in finance and administration were effected, and the total estimates (in yen) were as follows:—

Budget of 1925-6 in Yen

Revenue	. .	1,524,000,000
Ordinary	1,300,000,000	. .
Extraordinary	224,000,000	
Expenditure	. .	1,524,000,000

Compared with the preceding year's estimates there was an increase of 35,000,000 yen in the ordinary expenditure and a decrease of 126,000,000 yen in the extraordinary, making a net reduction of 91,000,000 yen in the total expenditure. The Government adopted the policy of avoiding recourse to public issues, thus relieving the money market from the demands of state finance. At the same time, by the retrenchment of expenditure, it exerted itself to encourage thrift. The chief items of revenue and expenditure for 1925–6 were as follows:—

Revenue and Expenditure, 1925–6 (in 1,000 Yen)

Ordinary Revenue:—	
Land tax	74,004
Income tax	195,855
Business tax	57,282
Tax on liquors	196,377
Sugar excise	70,099
Consumption tax on textile fabrics	53,672
Customs duty	98,825
Other taxes	49,116
Stamp duty	82,142
Receipts from postal, telegraph, telephone services	203,603
Forests	39,288
Profits of monopoly	130,276
Other receipts from public undertakings and state property	22,023
Miscellaneous receipts	18,220
Transferred from special accounts	8,529
Total	1,299,311

Extraordinary Revenue:—	
Proceeds of sale of state property	4,715
Receipts from the issue of public loans	100,000
Local contributions to expenses incurred by the state for the benefit of certain prefectures	13,039
Funds belonging to special accounts transferred	26,077
Surplus of the preceding year transferred	104,119
Miscellaneous receipts	2,540
Total	250,490
Total revenue	1,549,801

Ordinary Expenditure:—	
Imperial household	4,500
Foreign affairs	15,783
Home affairs	41,177
Finance	282,341
Army	170,875
Navy	122,349
Justice	28,515
Public instruction	79,751
Agriculture	21,388
Industry and commerce	3,161
Communications	251,919
	1,021,759

Extraordinary Expenditure:—	
Foreign affairs	3,454
Home affairs	206,500
Finance	38,083
Army	28,514
Navy	105,016
Justice	2,075
Public instruction	19,212
Agriculture	20,690
Industry and commerce	7,646
Communications	96,856
Total	528,046
Total expenditure	1,549,805

Administrative Changes.—The principal changes in the financial and administrative system of the country made after the earthquake are:—

(1) the establishment of a special fund by means of a sum of about 130,000,000 yen to be taken out of the reserve capital of the Imperial mint, this fund to be applied to the improvement of national education and the development of industries in agricultural districts;

(2) the reorganisation of the deposit section of the department of finance by revising the administration and the mode of employing the fund belonging to that section, mainly post-office deposits, and by appointing a commission to advise the finance minister as to the proper method of employing the fund (this commission was set up in April 1925);

(3) the division of the old department of agriculture and commerce into two independent departments, one for agriculture and forestry and the other for commerce and industries (in March 1925);

(4) the creation of several new parliamentary secretarial posts (in Aug. 1924).

The National Debt.—The National Debt stood at 4,553,471,000 yen at the end of Aug. 1925, of which 3,051,455,000 yen represented the internal, and 1,502,016,000 yen the foreign loans. Of the external loans, an amount of 544,975,000 yen was raised in Feb. 1924: in New York $150,000,000 and in London £25,000,000. The proceeds were applied to the conversion and redemption of the outstanding balances of the Imperial Japanese Govt. 4½% loans, first and second series, issued on March 28 1905 and July 11 1905, respectively, and also to meet the expenditure for reconstruction work necessitated by the earthquake of Sept. 1923. The figures of the debt are as follows:—

Debt 1914–25 (in million Yen)

Financial year	Internal loans[1]	Foreign loans[1]	Total	Debt per head in yen
1914–5	991·5	1,514·8	2,506·3	46·968
1915–6	1,028·0	1,461·1	2,489·1	45·976
1916–7	1,097·4	1,370·2	2,467·6	44·919
1917–8	1,159·9	1,338·7	2,498·6	45·911
1918–9	1,268·8	1,311·1	2,579·9	45·976
1919–20	1,482·4	1,311·1	2,793·5	49·297
1920–1	1,809·6	1,424·3	3,233·9	56·506
1921–2	2,184·8	1,359·0	3,543·8	61·187
1922–3	2,450·1	1,358·5	3,808·6	64·887
1923–4	2,576·1	1,621·3	4,197·4	70·595
1924–5	2,822·9	1,506·7	4,329·6	80·000

[1] Amount outstanding at the end of the financial year.

V. ECONOMIC HISTORY

War Conditions.—Before the World War, Japan had alrea nearly recovered from the effects of the Russo-Japanese W and her economic activities had been making steady and m or less symmetrical progress. During the early days of the W the disturbance of international commercial relations broug about conditions which affected the Japanese nation in comm with the whole world. This state of affairs, however, chang later, when a huge demand arose on the part of the Alli Powers for the supply of immense quantities of munitions war, and when, in addition, the inability of the Europe belligerents to continue their overseas commerce on the pre-W scale caused a demand for Japanese products in the mark of India, the South Seas, Australia, South America and ev Africa. These factors, together with the natural decline imports from the European countries at war, conduced to tu the balance of Japanese trade in her favour practically for t first time in 20 years.

A great increase in the amount of specie held by Japan abro inevitably followed, while the stock of gold accumulated home rapidly grew. Then the rate of interest was lowered, a the prices of shares began to soar, thus causing general buoyan in the stock market. As a result Japan was placed in such position as to be able to redeem her foreign debt and to acco financial assistance to her Allies. This is shown in the followi transactions:—

Foreign debt redeemed	
4½% bonds	£20,516,400
Franc bonds	Fr. 200,009,500
Amount lent	
To Great Britain	Y280,000,000
France	126,000,000
Russia	240,053,067

Soon a considerable number of new undertakings, notably the field of shipbuilding, iron and steel manufacture and th chemical industry were brought into being. The rate of intere once again showed an upward tendency, and the issue of ban notes increased rapidly. The trend of circumstances describ above became more and more accentuated as time went o until at the end of 1916 the premature peace talk engender a spirit of temporary caution among Japanese manufacture and merchants.

The general international confusion of 1917, such as th introduction by the Germans of ruthless submarine warfare, th declaration by the United States of war upon Germany, th débâcle of the Russian revolution, and, in addition, the co tinuous internal troubles of China, all had repercussions up Japanese commerce. Nevertheless, in spite of the far-reachi effects of these great outside influences, Japan's trade and indus try continued on the whole to register a steady development.

Post-War Depression.—With the conclusion of the Armisti in Nov. 1918 the demand for warlike materials came to a abrupt end, and the branches of industry and commerce deali with iron, steel, copper, dyestuffs and chemicals received sudden and serious blow. There were even signs of economi depression, but the revived demand for foodstuffs and industri materials necessary for the economic reconstruction of Europ coupled with the trade activities in the United States, tem porarily maintained a prosperous state in Japan's commerc A telling blow to trade and industry was administered, howev by the financial panic which occurred in April 1920, due t over-speculation and the misuse of credit in certain quarters.

Readjustment.—Following the setback of the preceding ye the economic market had to devote itself in 1921 to the wo of readjustment, which caused general lethargy in industri enterprises and dullness in commercial transactions. It was these circumstances that in June 1922 the Government declar a new policy of financial and administrative retrenchment an readjustment, which was rigorously pursued until the who outlook became distinctly brighter; demand for money in th home-market declined, the balance in foreign trade improved, and the issue of banknotes decreased. In the latter part of

v. of the same year, however, this tendency was suddenly cked by the suspension of business of a few provincial banks. ergency measures were successfully taken by the Government well as by the Bank of Japan, but at the end of the year ney was still very tight and demands upon the bank for ances reached an enormous amount, with the result that a record was established in the issue of bank-notes.

n 1923, while the economic conditions of the country were in a state of unrest, Japan was suddenly visited by the aralleled catastrophe on Sept. 1, when the earthquake and flagration in the Kwanto district caused terrible loss of life well as severe material destruction. The effect on the coun- s sound economic and industrial foundation, however, was very serious, because the area devastated covered only a suming part of Japan, not a producing part. But the effect he disaster on the money market was felt to such a degree t for a time absolute financial confusion seemed imminent. tunately, emergency measures were promptly and effectively en by the Government, the Bank of Japan and the other ncial authorities to restore order in the business world. At end of Sept. 1925 the first step was taken towards the urn to a gold standard, when a shipment of 4,000,000 gold was consigned by the Bank of Japan to the Federal Reserve nk in New York. On Dec. 19 the removal of the embargo on shipment of silver bullion was announced.

Prices.—The following table shows, by wholesale price num- s based on Oct. 1899, the rise in prices of commodities in kyo between 1913 and 1924:—

Prices of Commodities
(Oct. 1889 = 100)

	1913	1916	1919	1923	1924
ice	183	116	390	277	327

Population, Production and Trade

Population.—The first national census took place on Oct. 1 1920. e following table gives the census figures for Japan proper, rmosa and Japanese Sakhalin, together with those obtained for rea from the local registrars' records. The figures for Japan proper rea 148,756 sq. m.) show that she ranks sixth in order of population ong the countries of the world, her number only being exceeded those of China, India, Russia, the United States and Germany. ith regard to the density of population, Japan proper (376 per . m.) ranks third, following Belgium (658), the Netherlands (536) d above Great Britain (374).

	Households	Population (1920)		
		Male	Female	Total
Japan proper	11,222,053	28,044,339	27,918,714	55,963,053
Taiwan (Formosa)	690,000	1,893,541	1,761,767	3,655,308
Karafuto (Japanese Sakhalin)	22,087	62,327	43,572	105,899
Chosen (Korea)	3,297,285	8,903,000	8,361,119	17,264,119
Total	15,231,425	38,903,207	38,085,172	76,988,379

The following table gives the census figures for 16 cities with a pulation numbering more than 100,000:—

Principal Cities

	Households	No. of Pop.		Households	No. of Pop.
Tokyo	456,820	2,173,201	Hakodate	29,155	144,749
Osaka	276,331	1,252,983	Kure	28,268	130,362
Kobe	138,986	608,644	Kanazawa	29,287	129,265
Kyoto	128,892	591,323	Sendai	21,861	118,984
Nagoya	92,426	429,997	Otaru	21,275	108,113
Yokohama	95,241	422,938	Sapporo	20,038	102,580
Nagasaki	37,036	176,534	Kagoshima	19,942	103,180
Hiroshima	34,553	160,510	Yawata	22,322	100,235

There are 31 cities with a population of from 50,000 to 100,000; 136 with from 20,000 to 50,000, and 374 from 10,000 to 20,000. On Oct. 10 1925 the second national census took place, but at the time of writing the full figures are not available. The results received to date show that Japan proper has a population of 59,736,000, including 30,012,000 males, an increase of 3,772,947 since the 1920 census. On Oct. 1 1924 the population of Japan proper was estimated at 59,138,900, which represented a yearly increase of about 800,000 for the five years ending 1924. In point of birth-rate, however, a tendency to decline has already set in, 36·2 per 1,000 in 1920 being the high-water mark.

Agriculture.—Japan, in common with most European countries, has witnessed a decrease in the number of people engaged in agriculture. During 1916 and 1917, when Japan was putting forth her greatest effort in producing munitions of war for the Allies, the number of those actually holding land decreased to the extent of 20,800 and 36,400 respectively; whilst in 1918, when the war boom in industry was practically over, the gain to agriculture was only 20,200 persons. This migration of the agrarian population toward cities, together with the modern industrial tendency of the nation, is making it more and more difficult for landowners to find tenants. Rural reorganisation has been an economic problem for some time.

Farmers and Tenant Farmers

	Farmers cultivating own land	Tenant farmers	Farmers combining tenantship
	%	%	%
1908	33·27	27·58	39·15
1923	30·60	28·23	41·17

The high proportion of small holders in Japan is characteristic of the agricultural life of the country, as is shown by the following table giving the percentage of total landholders with holdings of under 1·23 ac., etc.:—

	Under 1·23 ac.	Over 1·23 ac.	Over 2·45 ac.	Over 4·90 ac.	Over 7·35 ac.	Over 12·25 ac.
1908	37·28	32·61	19·51	6·44	3·01	1·15
1923	35·11	33·59	21·39	5·88	2·57	1·46

Rice still remains the staple food of the country, and the area under cultivation is nearly twice that devoted to the production of barley, rye and wheat. Intensive cultivation of all crops is carried out, and the limit of return has actually been reached in some cases.

Cotton, hemp and indigo were all retrogressive, the cotton chiefly owing to the large imports of cheaper cotton from abroad. The following table shows the area under cultivation and the production of the chief food products:—

Principal Crops

	Area under Cultivation		Production	
	1914 Hectares	1923 Hectares	1914 Hectolitres	1923 Hectolitres
Rice	3,008,298	3,121,363	102,834,926	100,056,199
Barley	611,218	473,859	17,225,132	13,701,265
Rye	721,306	557,774	13,001,461	10,564,001
Wheat	474,721	483,833	8,096,399	9,366,031
		1922		1922
Millet	203,087	151,630	3,984,178	3,511,698
Beans	589,694	580,712	8,256,823	8,278,735
Buckwheat	160,222	124,624	2,469,232	1,984,797
Rapeseed	123,092	90,609	1,593,065	1,229,310
			Metric tons	Metric tons
Potatoes	83,125	100,102	879,385	915,379
Sweet potatoes	302,493	288,372	3,679,155	3,768,963
Seed cotton	2,452	2,105	3,081	1,876
Hemp	10,926	10,023	9,469	11,815
Indigo (leaf)	4,476	4,652	8,176	8,333
Sugar-cane	22,414	25,711	1,001,078	812,489

Industrial Development.—Although the expansion of Japanese industries was enormous during the World War, the rate of progress registered in the pre-War period of 1908–13 had also been remarkable. In 1908 there were 11,390 industrial establishments and 196 Government factories; in 1913 the Government factories had decreased to 188 (in 1918 there was a further drop to 161), but the other industrial establishments had increased in number to 15,811, or by 38·8%. By 1918 the figure had risen to 22,391, an increase of 41·6% on 1913 and 96·6% on 1908. In a decade, that is to say, Japan had practically doubled the number of factories in operation; but the after-War trade depression affected industrial development to some extent.

The following table illustrates the development:—

Industrial Progress

Government factories					
	No.	Motors	Kilo-watts	Operatives	
				Men	Women
1913 (Mar. 31) .	188	5,211	217,965	99,992	29,994
1918 (Mar. 31) .	161	7,014	269,475	123,087	36,349
1922 (Dec. 31) .	. .	8,679	635,112	124,725	43,429

Industrial establishments					
	No.	Motors	H.P.	Operatives	
				Men	Women
1913 (end of)	15,811	19,084 1,330	1,122,597	375,596	540,656
1918 (end of)	22,391	41,689 878	2,006,098	646,115	763,081
1922 (end of)	46,427	86,312 804	2,942,730	834,314	856,705

Shipbuilding.—In 1898 a steamer of 6,000 tons, the first large boat to be built in a Japanese yard, was completed by the Mitsubishi dockyard at Nagasaki for the Nippon Yusen Kaisha. Subsequently the same dockyard and the Kawasaki establishment constructed steamers of over 10,000 tons, as well as cruisers for the Imperial Japanese Navy and for China. In 1912 these two dockyards had reached such a high state of development that each was entrusted with the building of a dreadnought of 27,500 tons. Soon after the outbreak of the World War the private shipyards enlarged their capacity for building and made marked progress, though handicapped by an inadequate supply of materials and skilled labour. But the yards have been suffering from post-War depression, and also from the effects of the Washington Agreement (*see* WASHINGTON CONFERENCE); being obliged to curtail the scope of their work, and, in some cases, completely to suspend it.

The number and total tonnage of ships launched in the years 1913, 1918, 1921–4 is as follows:—

Ships launched						
	Steamships		Sailing Vessels		Total	
	No.	Tonnage	No.	Tonnage	No.	Tonnage
1913 .	115	51,525	659	43,598	774	95,123
1918 .	443	540,531	1,804	161,964	2,247	702,495
1921 .	69	226,081	12	1,711	81	227,792
1922 .	57	71,076	14	2,167	71	73,243
1923 .	56	74,284	1	2,500	57	76,784
1924 .	39	71,440	6	1,006	45	72,446

With regard to her merchant fleet, Japan advanced during June 1914 to June 1920 from sixth to third position among the world Powers, since at the latter date she possessed 2,996,000 tons as against 1,708,000 tons in 1914, thus emerging after the War with an increase of 1,288,000 gross tons.

Raw Silk and Silk-Weaving.—The manual dexterity peculiar to Japanese women is a factor which ensures the lasting prosperity of Japan's raw-silk industry, and when full advantage has been taken of the various modern processes of production in silk filatures enhanced benefit should accrue. Japanese silk goods have made great progress, and particularly silk pongee, which has now practically driven the Chinese product from the markets of the United States. At the end of 1922 there were 2,863 factories engaged in the silk industry, employing 23,893 male and 262,732 female operatives.

Cotton Spinning.—In spite of the difficulties during the World War of importing from Great Britain and the United States sufficient machinery to meet the enhanced demand for cotton yarn, the spinning-mills of Japan prospered exceedingly. The paid-up capital invested in the mills at the end of June 1920 was 248,180,000 yen, equivalent to an increase of 288% over the pre-War figure; whilst the number of spindles in use in 1918 was 3,384,800, and in June 1920 3,689,000, compared with 2,409,900 in 1914. At the end of 1918 there were 6,710 factories, with 65,316 male and 218,041 female operatives, the total number of workers in the textile industries being 777,65 The latter figure includes about 25,000 who are engaged in the pr duction of knitted goods, consisting principally of gloves, stockin and underwear, in which a large trade, chiefly with British India, h grown up in the last few years. As knitting was formerly entirely domestic industry, there have been difficulties in producing goods uniform quality for export, and a system of inspection was therefo instituted towards the end of 1917, under which the exportation articles of inferior quality was prohibited. Previous to the War, t average output of knitted goods was 6,660,000 doz., valued 8,937,000 yen, but during the five years of the War the output ave aged 15,143,000 doz., valued at 23,073,000 yen. According to th report of the Cotton Spinning Association, at the end of 1923 t factories numbered 241, with an aggregate paid-up capital 376,273,000 yen, while the spindles numbered 4,422,000.

Iron Foundries.—Before the War there were only some 20 iro foundries in Japan, but the difficulties experienced during the War i obtaining from abroad the large quantities of iron and steel requir to meet the boom in industry resulted in the establishment of ove 250 foundries before the close of 1919. In 1914 the output of pig-iro amounted to 302,000 tons and of steel materials to 283,000 tons. I spite of the slump in the iron industry which occurred after th Armistice, 613,000 tons of pig-iron and 553,000 tons of steel materia were produced in 1919. The total investments in iron foundries at th end of 1921 amounted to 350,000,000 yen. In the same year th working capacity of the ironworks was 1,412,000 tons of pig-iron 1,033,000 tons of steel, and roughly 1,450,000 tons of steel materials while the actual output amounted to less than one-half the capacity *i.e.*, 556,531 tons pig-iron and 557,826 tons steel materials.

Machine and Tool-Making.—At the end of 1922 about 6,720 fac tories were engaged in various forms of machine-making; and also i many branches of metalwork and metalware. The manufacture o machinery for the production of electric apparatus and lamps, a well as the construction of dynamos, telephones, railway signals an measuring instruments, are practically new growths of the iron and steel industrial activity.

Dyestuffs.—The manufacture of dyestuffs was an untried industry in Japan prior to the War, and in 1913 no fewer than 6,000 tons o dyestuffs, valued at 8,000,000 yen, were imported for use in the cot ton and silk industries. After the outbreak of the War the cessatio of foreign supplies, chiefly derived from Germany, compelled Japa to make an effort to become, to some extent, self-supporting. I 1915 certain dyes were produced, the largest quantity being sulphuric black, then alizarin, acid blue and aniline salt. These were followed by yellow, red and blue acid, yellow and red direct, and purple, blu and brown basic colours. Early in 1916 the Government started an subsidised the Japan Dyestuff Manufacturing Co., which later su ceeded in producing an artificial indigo, though only on a laboratory scale. By 1918 they were in a position to export Japan-made dyes, but within a short time foreign dyes reappeared on the market, apart from the German indemnity dyestuffs which arrived in May 1921. Though the *ad valorem* duty was raised to 35% in 1920, these foreign products almost strangled the infant industry. In 1923, 23 factories, with a capital of 13,565,500 yen, were in existence.

Chemicals.—The manufacture of chemicals in Japan does not owe its inception to the War, but its great development and the many innovations introduced were the direct result of War-time conditions. There was, however, a sharp decline in the prosperity of the chemical industry immediately after the Armistice. In 1916 the Government set up a subsidised company for the production of glycerine, and as the result of extensive investigations at the industrial institute into the qualities of seaweeds and vegetable ash, the production of basic chloridised alkali increased from 2,000 tons in 1913 to 10,000 tons in 1917. The match industry, which formerly derived chlorate of potash from European sources, by the end of 1917 was able to depend on the home supply, and gained an important place in export trade; but of late, owing to the advance in price of raw materials, and also the rise in wages at home, the industry has been beaten, chiefly by the Swedish match industry, especially as regards exports.

The soda industry, although it existed as long ago as 1880, did not reach a high standard of technical perfection before the War, and also failed to satisfy the total annual requirements in caustic soda, amounting to about 25,000 tons. During the War, however, the number of factories increased to about 20, and the annual production rose to 14,000 tons in 1918 and 20,000 tons in the following year.

Some of the chief products in the chemical industry are: sulphuric, hydrochloric and nitric acids, sodium sulphate, carbonate of soda, caustic soda, iodine, potassium iodine, potassium chloride, ammonium sulphate, acetic acid, acetone and wood spirit.

JAPAN'S FOREIGN TRADE

The rapidity with which Japan's foreign trade had developed, both in volume and extent, during the half-century preceding 1925 provides a remarkable record in commercial history. The total value of exports and imports, which in the first year of Meiji (1868) amounted to the insignificant total of 26,000,000 yen (£2,650,000), increased 10-fold in 1895, 100-fold in 1917, and 167-fold in 1920; and though he three following years it had shown a great decrease, the le for 1924 again mounted to 4,260,623,000 yen.

avourable Balance.—The most striking progress was made during World War, when Japan's foreign trade leapt from 1,362 million (£139,000,000) in 1913 to 4,284 million yen (£438,000,000) in 1920; ough it should be remarked that these figures do not correctly esent the proper rate of increase in the volume of trade, owing he inflation of prices. In the very beginning the War reacted judicially upon foreign trade, as well as upon other branches he country's commerce and industry, and the first appreciable ct of the War in increasing trade showed itself in the returns 1915, when the adverse balance which had obtained for 20 years— the exception of the years 1906 and 1909—was superseded by vourable one. This favourable tendency was accelerated until excess of exports over imports attained 371,000,000 yen (£38,000,-) in 1916 and 567,000,000 yen (£58,000,000) in 1917.

he sudden expansion of trade due to the War was occasioned both ctly through the great demand by the Allied belligerents for nitions of war; and also indirectly through the temporary retire- nt of the great industrial Powers of Europe from the arena of ld commerce and trade. Soon after the outbreak of the War anese goods—chiefly consisting of semi-manufactured and fin- ed articles, such as cotton fabrics, leather goods, watches, silk ues and so forth—found their way in large quantities not only to established markets in the Far East, but also to various quarters he world hitherto but little explored by Japanese traders, namely, South Seas, South America and even Africa. The most conspicu- expansion, however, was effected in the exports to China and lia, and, until the outbreak of the Russian revolution in 1917, ge shipments of munitions of war and foodstuffs to Vladivostok for in European Russia assisted to augment the volume of trade with ia. The United States began to buy heavily in 1916, when the ures advanced from 204,000,000 yen (£20,900,000) in the preceding r to the substantial amount of 340,000,000 yen (£34,800,000) the ds purchased consisting mostly of raw silk, "habutai" (silk piece ds) cotton yarns, cotton fabrics and tea. British America and also xico increased their orders from Japan, and the South American de showed such prospects as to induce Japanese companies to en shipping facilities to Brazil through the Straits of Magellan.

The import trade, which had been on the wane in the early days the War, commenced to revive in 1916, owing to larger purchases raw materials and semi-manufactured goods, such as raw cotton, n, wool, crude caoutchouc, flax and jute. By far the largest vol- ne of raw cotton came from British India, but the United States d doubled her exports of that article to Japan as well as of iron in a elvemonth. Australia supplied Japan largely with wool.

An Adverse Balance.—The War was the cause of serious vicissi- des in 1917, and in a measure militated against the expanding nd of Japan's commerce. The entry of the United States of Amer- into the War, with its attendant embargo on steel, iron and gold, nporarily disturbed the economic equipoise of the Far Eastern pire. The Russian revolution and the subsequent repudiation of foreign liabilities by the Bolshevik commissaries introduced a sh factor of discouragement in the export trade of Japan. The ternal political feuds in China would also have dismayed Japanese porters but for the tremendous appreciation in the price of silver, ich resulted in maintaining an abundant demand for Japanese ticles. But in spite of all, Japan's foreign trade made progress re or less on the lines previously indicated, until a complete ange in the situation was brought about by the conclusion of the mistice in the autumn of 1918. The demand for munitions of war turally came to an end, but the rate of exchange on Europe con- nued at a high level. At home the cost of production had greatly creased owing to the advance in wages and the higher prices of in- strial materials, while the enriched public demanded a higher oportion of the necessaries of life. An anti-Japanese boycott was oceeding in China to add to the curtailment of Japan's exports.

All these circumstances, reinforced by the Imperial ordinance of ov. 1919 for the regulation of the price of commodities, tempo- rily exempting certain foodstuffs and industrial materials from port duties and restricting the exportation of cotton yarns, re- rsed the balance of foreign trade, which had been favourable to pan for the preceding four years. This unfavourable tendency con- nued in succeeding years, showing an adverse balance of trade in 20 as high as 387,780,170 yen. The Government had under con- deration several suggestions as to the best method of bringing about n improvement in foreign trade, but, though no special steps were ken, there were prospects of improvement, owing to the certainty at the economic condition of the country was advancing little by ttle, and in view of the fact that the adverse balance of 1922 was nly 252,856,414 yen—a decrease of 135,000,000 yen compared with he year 1920.

Unfortunately, however, the great earthquake of 1923 dissipated hese anticipations, for, on the one hand, the export trade declined harply owing to the burning of large stocks of raw silk, silk fabrics, tc., and the partial destruction of the productive capacity of cotton arn, cotton fabrics and other articles usually so prominent among he exports; while, on the other hand, the volume of imports continued to increase, due to the abnormal increase in the demand for wool, woollen yarn, etc. Also, in order to facilitate the supply of goods after the earthquake, an Imperial ordinance was promulgated, providing for the suspension until March 31 1924 of import duties on rice, beef, etc., and for the suspension or reduction of import duties on certain other necessaries of life, tools, machinery and materials for construction and civil engineering, with the result that imports were stimulated.

Thus the excess of imports over exports in 1923 reached the huge amount of 534,479,850 yen. In 1924 the tendency became even more pronounced—the amount being 646,157,000 yen—and this in spite of the expiration of the ordinance just mentioned, and the introduction of a tax of 100% imposed from June 1924 on the value of certain luxury articles. The excess of imports was chiefly due to the purchase of materials necessary for reconstruction.

Foreign trade prospects in 1925, however, were considerably brighter, owing to the fact that fewer reconstruction materials were being imported, while the economic conditions of Japan were becoming normal again, and the "Buy Japanese goods" slogan was having effect. In the latter part of the year 1925 such an excess of exports over imports shown would counteract to a great extent the excess of imports over exports shown during the first six months of that year.

The following table gives the foreign trade of Japan for 1913–25, and the movement of coin and bullion:—

Foreign Trade (in 1,000 Yen)

	Merchandise		Gold and Silver Bullion and Specie	
	Exports	Imports	Exports	Imports
1913	632,460	729,432	27,093	1,021
1914	591,101	595,736	29,650	9,107
1915	708,307	532,450	44,566	24,297
1916	1,127,468	756,428	28,079	101,030
1917	1,603,005	1,035,811	153,736	392,225
1918	1,962,101	1,668,144	938	5,016
1919	2,098,873	2,173,460	5,054	327,477
1920	1,948,395	2,336,175	3,897	404,727
1921	1,252,838	1,614,155	..	138,622
1922	1,637,452	1,890,308	2,180	1,672
1923	1,447,751	1,982,231	5,466	196
1924	1,807,258	2,453,390	5	4,099
1925[1]	1,656,188	2,033,345	4,008	138

[1] Up to end of Sept.

Exchange.—The dollar rate, which dropped to $38.50 per 100 yen at the end of 1924, rose by the middle of April 1925 to $41.50, this being the highest figure during the first half of 1925. At the end of Nov. 1925 it stood at about $42.00. In the sterling exchange steady improvement was also perceptible, the rate having risen from $19\frac{1}{4}$d. in Jan. 1925 to $21\frac{1}{16}$d. per yen in the middle of Nov. 1925.

Distribution of Foreign Trade.—The geographical distribution of Japan's remarkable expansion in foreign commerce according to continents is as follows:—

Exports by Continents (in 1,000 yen)				
To	1913	1920	1923	1924
Asia	275,928	998,374	587,397	757,061
America	191,761	632,245	634,212	782,882
Europe	147,225	195,590	79,838	175,051
Australia	8,638	58,115	32,639	41,907
Africa	1,846	39,620	25,240	41,202
Imports by Continents (in 1,000 yen)				
From	1913	1920	1923	1924
Asia	348,055	942,547	814,470	998,603
America	127,035	910,648	546,832	721,325
Europe	220,290	305,318	437,457	581,091
Australia	14,943	62,459	96,623	119,971
Africa	7,189	88,449	22,716	22,072

In receipt of exports from Japan the United States of America (41%) has always headed the list, the zenith of purchase being reached in 1919—828,097,621 yen; China (including Kwantung Province) follows with 23%; and then come British India (7%), France (5%), Hongkong (4%). The percentages refer to Japan's export trade in 1924. Notable, also, are the advances of Australia, the Philippine Islands, Germany, Italy, Peru, Belgium and others in the scale of demand for Japanese goods.

As regards imports into Japan, British India, which had been the chief supplier for several years precedent to the World War, yielded her place to the United States in 1916. The import trade of Japan in 1924 was shared by the United States of America (27%), China (17%), British India (16%); England (13%), Germany (6%), Australia (5%), Dutch Indies (4%), Canada (2%).

The following tables show the development of Japan's foreign trade in the more important commodities:—

Principal Exports (in 1,000 Yen)

	1914	1919	1924
Silk (raw, waste, floss)	161,797	623,618	706,220
Habutai	30,890	101,289	57,368
Silk tissues	34,022	162,476	125,842
Cotton yarn	78,554	114,232	109,537
Cotton tissues	34,840	280,311	326,750
Woollen tissues	1,198	11,124	2,401
Hosiery			22,024
Braids	14,355	20,014	9,170
Matches	11,052	32,968	9,212
Copper	28,467	25,889	2,366
Coal	23,914	37,723	22,396
Potteries	5,913	22,629	25,435
Paper	2,826	25,402	15,582
Aquatic products	13,416	16,191	24,786
Tea	12,709	18,402	12,781
Refined sugar	12,382	21,627	28,967

Principal Imports (in 1,000 Yen)

	1914	1919	1924
Raw cotton	218,974	667,866	605,271
Wool	14,783	61,304	88,041
Woollen and worsted yarns	4,140	668	63,510
Woollen tissues	10,225	12,301	61,648
Oil cake	34,864	135,188	103,674
Iron	36,319	227,797	196,398
Sulphate of ammonium	15,145	27,435	26,543
Coal	6,690	18,588	29,057
Timber	1,490	10,889	129,076
Paper	4,886	18,386	27,360
Machinery	24,494	89,221	128,345
Rice	24,823	162,070	70,804
Sugar	21,678	58,183	63,849
Wheat	8,488	38,530	73,839
Beans and peas	13,320	35,302	60,877

COMMUNICATIONS

Railways.—The first railway line in Japan was opened to traffic in 1872, subsequent development of the railway being chiefly in the hands of private companies. In March 1906 the railway nationalisation law was passed, and in the next two years the Government gradually assumed control of some 17 leading railway companies. On the completion of nationalisation the Government possessed 4,371 m. of railway, representing a capital of 700,000,000 yen. By the end of 1917 the process of absorption was practically complete. In the decade 1913–23 the mileage of the state railway system increased fron 5,473 m. to 7,013 m., and in the same period the number of passengers carried increased from 167,773,143 to 512,754,754. A marked advance was seen in the financial year 1918–9 in the receipts, which amounted to 104,135,074 yen, while in 1922–3 the receipts were 199,877,464 yen. A railway tunnel between Moji and Shimonoseki, under the Shimonoseki Straits, has been projected and its construction is expected to be started in 1927. This tunnel, which will be completely under the sea for one mile, will connect the island of Kiushu with Honshu on the mainland.

Posts.—The postal service of Japan has developed steadily, both in extent and efficiency, since 1908. There are three grades of post-office, known as first, second and third class. The first class is confined to the larger cities, such as Tokyo and Osaka, and these offices not only act as supervising offices for those of lower category, but also control maritime affairs in their respective districts. The great majority of the post-offices belong to the third grade, and are conducted on a contract system, which has proved eminently satisfactory. The post-offices in Japan include in their operations such diverse matters as the carrying, within limits as to size and weight, of every kind of freight, the collection of taxes and bills, the distribution of advertisements, and the paying of pensions and annuities on behalf of the national Treasury. The post-offices also undertake the business of state life insurance by a simplified process for the benefit of the middle and working classes. The expansion of the postal services is shown in the following table:—

Postal Service

End of fiscal year	Number of post-offices	Number of messages	Number of parcels
1909–10	6,946	1,464,557,721	20,281,823
1911–2	7,166	1,634,423,611	23,178,936
1913–4	7,268	1,798,716,674	25,370,165
1915–6	7,358	1,888,002,293	26,128,093
1917–8	7,647	2,362,802,401	33,243,648
1919–20	7,900	3,359,758,218	41,308,098
1920–1	8,025	3,815,527,979	43,322,650
1921–2	8,230	4,001,817,560	48,936,915
1922–3	8,477	4,126,958,030	51,355,991

The post-office savings bank was first inaugurated in 1875, an the rate of interest was raised from 4·2% to 4·8% in April 191 The number of depositors increased from 11,882,069 on Mar 31 1913 to 27,057,867 in 1922, the deposits having advanced i the same period from 191,122,853 yen to 994,976,098 yen.

Telegraphs.—Since 1879 Japan has belonged to the International Telegraph Convention, and in June 1908 she ratifie her membership of the International Wireless Union. The expansion of her home telegraph service has been noteworthy. I 1910, with a total of 3,951 telegraph offices, 101,500 m. of wire were in use and 28,205,032 messages were sent; in 1923 ther were 6,460 offices, 156,662 m. of wires in use, and 71,592,9 messages were transmitted.

Wireless.—Japan associated herself with the Internationa Wireless Union in 1908. In addition to the main wireless statio of Funabashi, erected in Nov. 1916, Japan has 11 other Government stations, with a daytime transmission distance varyin between 300 and 600 nautical m., the night distance being between 1,000 and 1,800 nautical miles. Two of these stations Choshi and Osezaki, have been reconstructed and have a daytime transmission power of 1,500 nautical m., with 3,000 m. a night. In the twelve months ended March 31 1914 there we 36,313 wireless messages, and 172,853 in 1922–3.

Telephones.—When first inaugurated in Dec. 1890 the telephone service failed to attract many subscribers, but its popularity gradually increased. The authorities started in 1909 a system of giving preference for an installation in consideratio of a payment varying between 150 and 285 yen, according to locality, and this system, which has been very successful, still obtains. The maximum annual charge for the telephone servic is 66 yen and the minimum 36 yen, according to locality, and at the end of the fiscal year 1922–3 there were 415,058 subscribers and 3,988 telephone offices, besides 1,538 fitted with automat apparatus. In the same period the length of telephone lines was 14,526 m., the length of wires 1,197,861 m. and the number of messages in the year was 1,933,759,123.

See *Japan Year Book* (annual, Tokyo); reports of the America Bureau of Commerce and of the British Department of Overseas Trade.

(K. M.)

JAPANESE LITERATURE (*see* 15.168). *The Taisho Era.*—The glory of Meiji was, alas, not to be sustained. Whether the mistake lay with the old giants of the Meiji era or in the insufficiency of their sons it is impossible at this close range to decide. In the later years of the Meiji period it became obvious that the spirit animating the intellectual and literary leaders was dying; some of the old magic still clung to the name of the dynasty, but nothing more. The new writers lacked the capability for sustained effort, their works were spasmodically produced, and were often completely without style. There was an unrestrained crudeness about the new literature which horrified those who still remembered the early Meiji period.

The change was almost complete when the young men began banding themselves together into various associations, such as the "New Romanisation Society" (Shin Romaji Kai), the "Foreign Language Research Society" (Gaikokugo Kenkyu Kai), the "Japanese Script Society" (Nipponji Kai), etc. These unofficial organisations achieved very little, except of positive harm. Americanisms, cant and slang terms, undistinguished from "standard English," were imported freely and incorporated into novels, belles lettres and even scientific treatises. The free-verse writers of England and America must be held responsible a peculiarly unpleasing form of composition which, while rely foreign to the genius of the Japanese language, was oted by the writers of this period in place of the *tanka* and *u* as the only possible style of poetic composition. The actual lt of these liberal importations from foreign fields was the l of ineffective and often vulgar books offered to foreign ents as Japanese contemporary literature. While book- luction was never so ample, it was never so uniformly devoid ierit.

he Meiji era translations of European classics and con- porary works, though marred by many faults of inexperience, still to be preferred to later versions. Bacon, Shakespeare, auley, Milton, Byron, Shelley, Keats, Victor Hugo, de ipassant, Dante, Heine, were all retranslated under this asty. The new translations are, however, far from being ible. In many cases, whole sections of the original are left anslated at the whim of the editor. Despite this, the char- r "zen" (complete) is found on the back of the book and on title-page. This renders such versions useless for class-work ven for purposes of reference. In other cases, scenes which purely national in the original work are recast, details being red to suit Japanese surroundings. Thomas Hardy's novels er particularly in this unnatural transmutation: in one or popular translations now in vogue Hardy becomes merely a liocre Bakin leading some dull puppets over dreary Japanese shes.

ussian Influence.—The outstanding literary feature of the shō era is the inundation of Japan by Russian works. Tol- ceased to be fashionable; Andreyev, Balmont, Sologub, hkin, Zinaida Hippius, Lermontov, Gogol, Tchekhov and geniev held the imagination of youthful Japan during these rs. Although no further impulse was needed, it was supplied the signing of the Russo-Japanese Treaty early in 1925, when nerous societies for the encouragement of research into sian literary and philosophic fields sprang into existence. sian plays were hastily and imperfectly translated into Jap- se (*The Cherry Orchard* was a noteworthy exception), and duced by Japanese actors at the Little Theatre in Tsukiji, kyo.

he modern native literature borrowed most of its colour and ch of its form from Russia. Gogol, in his more dreary moods, freely translated into novels of social life, and the senti- ntality so characteristic of the true Japanese novelist be- nes tinctured with a despair imported from the Siberian opes. Arishima Takeo, an idol of the young reader in modern an, demonstrated this phase not only in his novels, but in life and death. He was a married man, drawn by "mis- lerstandings" into an intrigue with a woman journalist (the ew woman" of his later novels). The truth of the affair was er revealed; in true dramatic fashion, Arishima and his paramour committed "*shinju*" (double suicide for love), in a house in unfrequented country place. This happened in 1922, and an be safely asserted that Arishima was more loved after his l-staged exit than he was during his lifetime. Obituary no- es drew parallels between this successful writer and such nly envisioned figures as Gogol and Andreyev. That the nts of contact were more imaginary than real did not deter tors from flights of the wildest fancy as to the effect Arishima's ith would have on Russia and the world generally.

The new-world treatment of women engaged the attention of iters of all classes, and political writers condemned the istic changes proposed by the novelists. Women in Japan gan to assert themselves, they emerged from the obscurity of dalism into the open highway of competition with men. urnalism, government departments, politics, municipal under- kings, social work, all claimed the attention of intelligent men. Foremost, perhaps, not only of modern woman-novel- s but of all since the days of Murasaki Shikibu is Mrs. Yayoi ogami, wife of Nogami Toyoichiro, the greatest living Japan- e authority on the classical drama (Nō), and translator of rnard Shaw. A later novel of hers, *Kaishin Maru* (The Sea- d Ship), is justly esteemed above all contemporary works.

Notable Writers.—No account of modern Japanese literature would be complete without reference to certain writers who, in spite of their lack of real merit, have captured and held the popular imagination. Natsume Sōseki is chiefly remembered for his *Wagahai wa Neko de Aru* (I am a Cat) and *Botchan* (The Boy). He died before the full force of change induced by indiscriminate importation had been felt, and his work was modelled rather on the later Meiji style. "*The Two Kikuchi*," as they were familiarly called (Kikuchi Kan and Kikuchi Yuhō), devoted themselves to the writing of novels in which women's problems are discussed and advanced views of social life are set forth. Kume Masao, Satomi Ton and Akutagawa Ryunosuke, also, in some measure gratified the current passion for original styles and exotic scenes. Kurata Hyakuso is regarded as the leading spirit of modern Japanese drama; one of his plays, *The Priest and his Disciples*, has been translated into English and published with the original text by Glenn Shaw (Tokyo, 1923). The sex-novel of Europe has its imitations in works by Tanizaki Junichirō and Morita Sōhei. Tanizaki writes very colloquially on the subject of hysterical women, psychoanalytic studies in the West providing him with unlimited material. Morita Sohei was once considered a very brilliant writer, his *Baien* (Sooty Smoke) being an exceptional success. It is an autobiography or diary of the new woman, and, from the Japanese point of view, Morita has solved the problem of woman definitely and finally. At the time of the issue of *Baien*, Morita's style became settled and followed closely the best traditions of mid-Meiji; this no doubt accounted later for his lack of popularity. He afterwards turned his attention to translations of Ibsen's plays, but his "originals" were English versions, and it readily appears from the Japanese that Morita frequently failed to understand the text he was translating. Ibsen's *Doll's House* (Morita's Japanese translation) was performed at the Imperial Theatre in Tokyo in 1923.

Matsuura Hajime was the only literary man of this period who remained true to the best traditions of his country's literary history. Unaffected by the many new movements for the development of art, letters and the drama, he is the foremost poet and essayist of modern Japan. In 1925 he resigned his professorship at the Imperial University in Tōkyō, "as a protest against the insincerity and shallowness of modern academicians, artists and writers, who would profane the shrine of pure art by setting up base images of foreign clay." He published two volumes of his university lectures on literature among his other writings, and it is probable that his works will be ranged alongside the best productions of the Meiji era by the literary historian of the future. In his *Bungaku no Byakkō* (The Pure White Light of Literature) Matsuura displays a sensitiveness and purity of ideal which had been lost to Japan since the close of the Nara period.

The constitutional ban on revolutionary and socialist doctrines resulted in the issue of a complete Marxian library and a series of handbooks purporting to be short cuts to Bolshevism. Imperfectly conceived dogmas were presented in attractive guise as the European panaceas: for all Japan's troubles there exists a very simple melting-pot, and this is a weird communism in which the state should be a machine very far removed from the activities of daily life. "Freedom" became the slogan of Young Japan, but the "freedom" publications are very pale shadows of their European parents, and even omit to define the freedom to which they relate. (A. N. J. W.)

JAQUES-DALCROZE, ÉMILE (1865–), Swiss composer and teacher of musical eurhythmics, was born at Vienna July 6 1865, of French-Swiss parents. He went to Geneva in 1875 where he attended the college and the university, and followed the courses at the Conservatoire. He then studied (1887) at the Conservatoires of Vienna and Paris and completed his musical education under Délibes. In 1886 he accepted the post of *chef d'orchestre* at Algiers. He then returned to Vienna and studied composition under R. Fuchs and A. Bruckner. After the death of Hugo de Senger, he directed the sol-fa and harmony courses at the Conservatoire of Geneva (1891). He has written many charming songs, including *Chansons populaires*, *Chansons du coeur qui vole*, *Chansons de route*, etc. These are written in the simple form of the folk song and have obtained great popularity, not only in Switzerland, but in other countries. His other musical compositions are very numerous, and include three string quartettes, two violin concertos and several orchestral suites; also symphonies and choral works on a large scale such as *La Veillée* (1893) and *Le Festival Vaudois* (1903).

Among his other descriptive compositions may be mentioned: *Le violon maudit* (1893), *Janie* (1893), *Sancho Panza* (1897), *Le poème alpestre* (1896), *Le bonhomme jadis* (1905), *Les jumeaux de Bergamo* (1908), *Echo et Narcisse* (1912), *La fête de Juin* (1914), *Les premiers souvenirs* (1918), *La fête de la jeunesse* (1923), etc. His great work has been the development of the eurhythmic instinct, particularly in children, and since 1915 he has been the director at Geneva of the *Institut Jaques-Dalcroze*, which he originally founded at Hellerau in Bavaria. His method consists of a development of the instinct for rhythm in close conjunction with the sense of hearing and the instinct for tone, and is based on defined relations between bodily movements and the movements of sound. Special schools, based on the Dalcroze Method have been founded in London, Paris and elsewhere. The system may be studied in the following works by É. Jaques-Dalcroze: *Rhythmic Movements* (1920); *Rhythm, Music and Education* (1921); *The Importance of being Rhythmic* (1925); and *The Eurhythmics of Jaques-Dalcroze*, by various authors (1912). (*See* EURHYTHMICS.)

JASPAR, HENRI (1870–), Belgian politician, was born at Schaerbeek, Brussels, July 28 1870. While Minister of Economic Affairs in Nov. 1918, he organised the reconstruction of Belgian industries; becoming deputy for Liége in 1919. In 1920, having been appointed Minister of the Interior and afterwards Minister for Foreign Affairs, he endeavoured, during the Inter-Allied Conference in which he took part, to strengthen the entente between England, France and Belgium, and to secure reparations and security for his own country. In 1922 he negotiated a pact of security and guarantee with England; this, however, owing to the defeat of the French Govt., failed to come into operation. Belgium's entry into the League of Nations was due to the efforts of M. Jaspar, as also was her representation on the Permanent Court of International Justice at The Hague. In July 1921 he concluded an economic agreement between Belgium and Luxembourg and other commercial treaties. He took part in the Dawes Plan negotiations in 1924, but resigned as Minister for Foreign Affairs on March 11 on the rejection by the Chamber of the Franco-Belgian Convention. In May 1926 took office as prime minister and minister of the interior. (*See* BELGIUM.)

JASTROW, MORRIS (1861–1921), American Orientalist, was born in Warsaw, Poland, Aug. 13 1861, but went to Philadelphia at the age of five. Educated at the schools of that city and in the University of Pennsylvania, he studied subsequently at the Universities of Leipzig, Breslau, Paris and Strasbourg, returning in 1885 to the University of Pennsylvania as professor of Semitic languages and librarian. He died June 22 1921 at Jenkintown, Pa. He published numerous works on the religions and civilisation of Babylonia and Assyria, and, in connection with the World War: *The War and the Baghdad Railway* (1917); *The War and the Coming Peace* (1918); *A Gentle Cynic* (1919); *Zionism and the Future of Palestine* (1919).

JAURÈS, AUGUSTE MARIE JOSEPH JEAN (1859–1914), French socialist leader, was born at Castres, Tarn, Sept. 3 1859, of an old but not very prosperous local family. His ancestors on his father's side included two admirals, of whom one was ambassador to Spain and to Russia, and Minister of Marine. His mother's family included distinguished professors, of whom one was for a long time mayor of Castres. Jean Jaurès was of pure bourgeois stock. His father, a man of exceptional physique and of a lively intelligence, carried on at Castres various commercial activities, but without much method or practical sense. His mother exercised a real influence over her sons, and Jean had always a deep reverence for her. Her prudent intelligence and her good sense made her the true soul of the family and the educator of her children. A strictly orthodox Catholic, b without fanaticism, she inspired in her sons a respect for sincere beliefs and opinions.

Jaurès began his studies at a private school; then, with h older brother, who became an admiral, he entered, thanks to scholarship, in Oct. 1868, the college at Castres. He was a pup of exemplary conduct and remarkable intelligence, devoted his work, "le premier en tout." Mingling little in the roug games of his comrades, he possessed already that depth of serio gravity which he preserved all his life under the cloak of h natural liveliness and unfailing good humour. This "rare combination of high intellectual qualities" obtained for him scholarship at the Collège Sainte Barbe at Paris, where he we in 1876. He was enabled thus to pursue his studies for two yea at the Lycée Louis le Grand and to prepare himself for th entrance examinations of the École Normale Supérieure, t which he was admitted in 1878 with the first place. His care there was the most brilliant possible, and his fellow student among them being Henri Bergson, predicted for him a grea political future.

After having passed the "concours d'agrégation" Jaurè was elected, in 1881, professor of philosophy at the Lycée d'Alb In 1883 he became lecturer in the University of Toulouse. Bu he had already set his mind upon a parliamentary career, a though his mother did her best to dissuade him. At the legislative elections of Oct. 4 1885 he stood for the department o the Tarn and was elected deputy, heading the list with 48,00 votes. He was 26 years old. During the first two years of hi term, he took little part in debates. His poetic and burnin eloquence embarrassed parliamentarians accustomed to th so-called "britannique" eloquence of Clemenceau, Waldeck Rousseau, Ribot, Pelletan, Freycinet and others. His maide speech was delivered Oct. 21 1886 on a question relating t primary education. In 1887 he spoke three times; but the following year, more self-confident and more familiar with th peculiar atmosphere of the Chamber, he made numerous speeches some of them very important, on the most diverse subjects which he approached each time with an amazing competenc and a constantly growing sense of authority. On every questio with which he dealt, he adopted a courageous attitude whic showed him incapable of sacrificing his principles to parliamentary compromise or to motives of self-interest. Without allyin himself to any party, he devoted himself passionately to th public good and to the general welfare; but at the close of th session the meagre results of his efforts discouraged him so mu that he decided to abandon politics, and asked to be reinstat in his post of professor at the University of Toulouse.

However, upon the insistence of his friends, Jaurès consent to stand for Parliament once more. Before dissolution, th Chamber had substituted the "scrutin d'arrondissement" fo the "scrutin de liste" and Jaurès presented himself in the first district of Castres, which had long been in the hands of th reactionary parties. But on Sept. 22, at the first poll, he found himself in a minority of 856 votes though he himself had obtained almost 9,000.

In Nov. Jaurès resumed the professor's chair. His lectures were now thronged with students, workmen, middle class folk, other professors, men of science, men of learning. During this period he wrote his theses for the doctorate. His French thesis was entitled *De la realité du monde sensible*. In his Latin thesis he traced the origins of German socialism *De primis socialismi germanici lineamentis apud Lutherum, Kant, Fichte et Hegel*. About this time an ardent religious revival had stirred the imagination of many liberal minds. The questions thus raised were discussed by Jaurès in his lectures; but his robust and healthy rationalism resisted the tendencies of the day, just as later he opposed the vogue of pragmatism. An admirer of Renan, he would not admit dilettantism in matters of religion and the "subjectivism of faith" never had any attractions for him.

In the midst of the formidable labours which his personal work and the preparation of his lectures involved, Jaurès found time to comment regularly on topics of the moment in the impor-

t local organ *La Dépêche.* There his ideas on politics and
nomics were seen to turn more and more towards Socialism,
which, at the close of 1890, he at last publicly announced his
esion. At the same time, public life claimed him again. On
y 27 1890 at a local election, he was chosen municipal coun-
or of Toulouse, and his colleagues appointed him forthwith
uty mayor, in special charge of public education. He took
s an important part in elevating the school of medicine into
culty. After the strike at Carmaux, in the course of which
lefended the claims of the miners, Jaurès was elected deputy,
893, at a local election, and his term of office was renewed at
general elections of 1894. Defeated again in 1898, he was
lected in 1902; and his electorate remained faithful to him
n that time on.

n Parliament, as soon as he returned, he assumed a position
reat authority in politics. He took a large part in the debates
the Panama and Boulangist crises, in discussions of agrarian
colonial questions, on fiscal policy and protectionist meas-
s, on syndicalism and the separation of Church and State,
military laws and electoral reform. In the Dreyfus affair his
rgetic intervention captured the Socialist party, which hesi-
ed at first to take part in a conflict which seemed not to con-
n the proletariat. He carried on a formidable campaign in
our of the condemned and innocent man, a "living witness
military lies, to political cowardice, to the crimes of authority,"
did he cease until Dreyfus was definitely rehabilitated. His
eches and his articles on this affair are collected in one volume
ed *Les Preuves*, a masterpiece of analysis and eloquent logic.
ed by the logical development of his metaphysical and reli-
us ideas to social conceptions which obliged him to accept the
ialist teaching, Jaurès adhered closely to the Socialist party,
ich at each new election gained a larger number of represent-
ves in Parliament. But he realised at once that the fragmen-
ion of Socialists into groups and sects would be a source of
itical weakness and an obstacle to the ideals of social justice
the liberation of humanity which he wished to attain. For
n the "sublime joy of leading all men towards the fullness
humanity," lay in the effort to achieve these ideals. The
ialism of Jaurès differs essentially from the Marxian doctrine,
principle of which is pseudo-scientific. "Our socialism,"
tes Jaurès, "is French in origin, French in inspiration, and
nch in character." His ultimate aim was harmony founded
justice. Social harmony implies the disappearance of an
ustice which provokes conflicts, hatreds and their horrible
sequences, an injustice originating in capitalist ownership.
rès was a socialist because "the domination of one class is an
rage against humanity." Into this doctrine he breathed his
n glowing and generous ideas and, at the same time, drew
m it the strength with which he animated it. "No serious
ial programme can be realised without a definite social doc-
ne," he wrote, and for him the whole socialist ideal must
pire organic reformatory action and thus establish a socialism,
nocratic, republican and lay.

All socialist sects have the same social ideal, but their differ-
es in tactics and methods paralyse common action. Jaurès
ove to bring about unification. At the Congress of 1901, a
tion of groups rallied to him under the name of the *parti*
ialiste français, while the others formed the *parti socialiste de*
nce! After the Amsterdam Congress in 1905, the two groups
lesced and Jaurès became, in fact, their moral and intellectual
ef. Thereafter his political activity was bound up with that
the unified Socialist party, whose parliamentary activity he
ected with great skill. He drafted most of the resolutions at
cialist congresses and defended them in an admirably con-
atory spirit.

His philosophy of history, unlike that of Marx, did not hold
t the development of human society is subject to a blind
erminism; he postulated for it an intelligent directing force
d an ideal wisdom. "History," he wrote, "although a phe-
menon which develops according to mechanical laws, is
vertheless an aspiration to realise itself according to an ideal
. . . . The universe is but an immense, a vague, aspiration towards order, beauty, liberty." To conform to this aspiration, Socialism, according to Jaurès, should seek reform to bring about a less contradictory social order, whose institutions would be less exclusive, less bitterly egotistic, less mischievous, which would cease to perpetuate strife, hatred and want; which would permit men to pass from a state of brutal competition and conflict to the state of co-operation; which would transform the economic passivity of the masses into initiative and responsibility, in which social energies, instead of being wasted on sterile and insane conflicts, would be co-ordinated for common action. To uphold these convictions, Jaurès, after the Amsterdam Congress in 1905, struggled alone against the entire International for a share of power and for the preservation of the democratic-socialist *bloc.* He violently attacked and denounced as impotent the German Social Democracy which dominated the Congress and was supported by the old French Socialist organisations. On April 17 1904 Jean Jaurès, with Aristide Briand, founded *l'Humanité*, which has become the daily organ of the Socialist party. His daily leading article in it was written for the most part from his seat in the Chamber.

Jaurès early discerned the danger which threatened the world. He foresaw that the unstable equilibrium of the Triple Alliance and the Triple Entente was bound to end in a catastrophe, and he wished to avert it by the simultaneous international action of the proletariat. A passionate lover of France, he sought to spare his country the horrors of devastation by war. While he maintained that a democracy should not have an aggressive policy, he did not deny the duty of every nation to defend itself. To prevent misunderstanding between socialism and patriotism he wrote: "A nation which could not count, in days of crisis or when its life is in danger, upon the national devotion of the working class, would be a wretched thing indeed." He supported the policy of arbitration and all measures to secure international peace, but at the same time, in the name of the workers of France, he insisted "that the nation organise all its military forces, irrespective of class or caste, for the sole purpose of national defence." Against Germany, militarist and absolutist, stood France, a nation in arms, practising "a policy of supreme national defence which would lead not only to peace but to the assurance of peace." Jaurès expounded and developed his ideas on the organisation of "a nation in arms" in his book, *L'armée nouvelle.*

The policy of world-wide solidarity which Jaurès proclaimed was of no avail against the blind forces which precipitated the War, but Jaurès continued to strive for peace. On July 28 1914, before the outbreak of war, he, and some of his most eminent Socialist colleagues, went to Brussels to confer, in the name of the French Socialist party, with representatives of international labour on the best means of averting the threat of war, which he still thought could be avoided. But he was none the less full of anguish over the fate of France, compelled to defend herself against aggression. On this subject, he certainly felt no hesitation, for he had always been animated by the purest patriotism.

> "Il y a un groupement historique qui s'appelle la France, qui a été constitué par des siècles de souffrances communes, d'espérances communes; les lentes formations monarchiques en ont peu à peu juxtaposé et soudé les morceaux, et les ardentes épreuves de la Révolution l'ont fondu en un seul métal. C'est la patrie française . . . Oui, il y a des luttes, des antagonismes profonds de classe. Mais quels que soient ces luttes politiques, ces divisions économiques, ces antagonismes sociaux, ils ne peuvent pas porter atteinte à l'idée même de la patrie. . . . Si notre patrie est menacée . . . nous serions des premiers à la frontière pour défendre la France dont le sang coule dans nos veines, et dont le fier génie est ce qu'il y a de meilleur en nous."

These noble words leave no doubt as to the attitude which Jaurès would have taken, or of the rôle which he would have played in the "holy war for our beloved France if ever she were attacked." But on the very eve of mobilisation, in Paris, on July 31 1914, at 9:40, Jaurès succumbed to the bullets of an assassin—a wretched half-wit, impelled to this stupid crime by the calumnies of the adversaries of the great tribune. His obsequies were celebrated on Aug. 4 in the midst of an immense popular gathering, and his body was interred at Albi. In 1925 his mortal remains were brought back to Paris, and, borne on the shoulders of his faithful miners of Carmaux, deposited in the Panthéon. (Ed. He.)

JEBAVÝ, VÁCLAV (1868–), Czech poet universally known as Otakar, Březina, was born at Počátky, Bohemia, Sept. 13 1868. After an education in science he became a secondary school teacher in Southern Moravia, where he lived a life of contemplative seclusion, declining the honours and material advantages offered him by the Government. His published works consist of five books of poetry: *Secret Distances* (1895); *Dawn in the West* (1896); *Polar Winds* (1897); *Temple Builders* (1899) and *The Hands* (1901), and a volume of prose essays, *Music of the Springs* (1903); besides a number of poems scattered in various literary papers.

Březina is admittedly the greatest modern Czech poet, and is even judged by some foreign critics to be the greatest mystic poet of all nations. His development as a mystic philosopher and religious visionary passed from the subjective pessimism of his early poems, through a transcendental revelation of mystic realities, to an evolutionary optimism and a joyful belief in cosmic brotherhood. His art manifests an analogous development from an intimate lyrical impressionism through ecstatic incantations of a high-priest and a seer to an impersonal, super-personal, dythyrambic poetry of the elements, suns and stars, and of human effort, suffering and mystic destiny. His diction is so concentrated and pregnant with thought that it presents considerable difficulty at first reading; but this is more than compensated for by the superlative beauty and entrancing music of his verse, the remarkable wealth of his imagery and the extraordinarily human and personal appeal of his philosophy which has its roots in the mystic tradition of the medieval Czech religious sects. He brought Czech poetical language to a stage of perfection which it had never before attained and which is difficult to surpass.

See Paul Selver, *Anthology of Modern Slavonic Literature* (1919); *Modern Czech Poetry* (1920), and *A Study in Czech Literature* (1921). (J. Cl.)

JELLICOE, JOHN RUSHWORTH JELLICOE, 1st Earl (1859–), British Admiral, was born Dec. 5 1859, the son of J. H. Jellicoe, a captain in the mercantile marine. His great-grandfather was Sir James Whalley Smyth Gardiner, the third and last baronet of that name. Educated at Rottingdean, he entered the navy as a Naval Cadet at the age of thirteen. He obtained his commission as sub-lieutenant in 1880, and his hard work and marked ability won him three first class certificates in his three examinations for the rank of lieutenant. He soon developed a strong interest in gunnery and joined the Royal Naval College in 1883 for the theoretical part of the course for gunnery lieutenant, where he distinguished himself by winning a special £80 prize. The following year he spent in H.M.S. "Excellent," and became a fully qualified gunnery officer. From now onwards gunnery was his speciality, though his interests were by no means confined to this branch.

His first sea-going ship as a gunnery lieutenant was H.M.S. "Monarch," in which he served from 1886 to 1888. During his first year on board he went to the rescue of the crew of a stranded steamer, taking charge of a gig, manned by volunteers. The boat upset in a heavy sea and he and the crew saved themselves with difficulty. He received the Board of Trade silver medal for his plucky effort. After two years on the senior staff of the Gunnery School, he was appointed to the Admiralty as an assistant to the director of naval ordnance. In 1893 he was promoted to commander, and shortly afterwards was appointed to H.M.S. "Victoria," flagship of Admiral Sir George Tryon, commander-in-chief of the Mediterranean Fleet. When the "Victoria" was rammed and sunk by the "Camperdown," Commander Jellicoe had to take to the water. As he was seriously ill at the time he would have fared badly but for the support he received from a young naval cadet, Mr. P. D. Roberts-West, until rescued.

Commander Jellicoe soon recovered and two months later was appointed to the battleship "Ramillies" which flew the flag of the new commander-in-chief, Admiral Sir Michael Culm Seymour. After a three years commission in that ship he w promoted to captain on Jan. 1 1897, and served on the Ordnan Committee. In 1898 he was appointed to the command of H.M. "Centurion," where he became flag captain to Admiral Sir E ward Seymour, commander-in-chief of the China Station. the latter's chief of staff he took part in the expedition to relie the legations in Peking during the Boxer rising in 1900. Durin these operations Captain Jellicoe was badly wounded. He w subsequently awarded the C.B. for these services.

Service at the Admiralty.—He returned to the Admiralty 1902 to be the naval assistant to the controller (Third Sea Lord Here he acquired an insight of the work of that department whi was to be of great value to him later. In Aug. 1903 he went sea again to take command of the fine armoured cruiser "Drake for a year. The year 1905 saw him in the responsible post director of naval ordnance at the Admiralty. During his peri of office he did much to further the advance of long range firin and to assist the development of naval gunnery on lines whi more closely approximated to the real conditions of war. T wards the end of his time he reached the top of the captains' li and was promoted to flag rank in Feb. 1907. In Aug. that year he hoisted his flag afloat in H.M.S. "Albemarl as rear-admiral in the Atlantic Fleet. The appointment was a year's duration only, when once more he returned to the A miralty, this time to become a member of the Board as Thir Sea Lord and Controller of the Navy. In Dec. 1910 he wa appointed acting vice-admiral in command of the Atlantic Flee being confirmed in that rank in the following November. A the end of the year he transferred his flag to H.M.S. "Hercules, on appointment to the command of the 2nd Division of the Hom Fleet.

In 1912 important gunnery experiments were carried out b two battleships of this division, the "Thunderer" and "Orion, the former being fitted with this system of director firing whic Sir Percy Scott had been perfecting. The trials culminated i competitive firings which took place under Admiral Jellicoe personal supervision. It was as a result of these practices a largely due to Admiral Jellicoe's insistent pressure that this mos valuable system was adopted as the primary one for laying a firing the guns of practically all classes of H.M. ships. The even may be regarded as yet another milestone on the path of th gunnery progress for which he was greatly responsible. After year in this command he returned to the Admiralty to rejoi the Board as Second Sea Lord.

The War Period.—He left Whitehall temporarily in 1913 t become commander-in-chief of the "Red" fleet during manoeu vres, flying his flag in H.M.S. "Thunderer," but had returne to the Admiralty, when, on the eve of War, he was sent to joi the Home Fleet at Scapa as second in command. The period o command of Admiral Sir George Callaghan was due to expire in a few months and Vice-Admiral Jellicoe had already bee designated as his successor. When war could no longer be averted, it was considered desirable that the change in this mos responsible naval command should not be delayed and Sir John Jellicoe was appointed commander-in-chief with acting rank o admiral. He had to perform a peculiarly difficult and trying duty in relieving his former chief, who was trusted and respected in an unusual degree throughout the fleet. That he achieved it so successfully was due to the chivalrous attitude of these two fla officers towards each other and to the very high reputation and strong personal regard which Sir John himself enjoyed.

Admiral Jellicoe was confirmed in his rank in March 1915, and for two years bore the exceptionally heavy burden of organising and training the Grand Fleet and keeping it ready for battle His great command was put to the test at the battle of Jutland Now that the full details of that action are better understood the skilful handling of the British forces against an elusive enemy in conditions of low visibility and approaching darkness, is being increasingly appreciated. The German fleet escaped at night and took refuge in harbour with many ships severely damaged and such was the impression left by Jutland that Germany r again risked a meeting with the Grand Fleet. The fruits lmiral Jellicoe's leadership on that day and of his incomble services throughout his period of command were seen e historic surrender of German ships at the end of the War. the latter part of 1916 Admiral Jellicoe was invited to be- First Sea Lord and regretfully left his last and greatest nand afloat to take up that appointment. It was largely to his tireless labours and wide experience that the grave er of the German submarine menace was eventually over-, although others reaped where he had sown. He left the iralty at the end of 1917. After the Armistice he was sent special mission to visit the Dominions and advise on the post- organisation of their navies. On this tour he flew his flag .M.S. "New Zealand." He was promoted to Admiral of 'leet in 1919 and the following year was made Governor of Zealand. During his four years in this high office he greatly ared himself to the people of that Dominion.

r his services in the War Admiral Jellicoe received the ks of Parliament and a grant of £50,000, and at the end of he was raised to the peerage as Viscount Jellicoe of Scapa, equently taking the additional title of Viscount Brocas of hampton. On his return from New Zealand and in recogni- of his services as governor he was, in 1925, created an Earl. eceived the K.C.V.O. in 1907, G.C.B. in 1915 and G.C.V.O. 16; he also holds a number of foreign orders. He married, 02, the daughter of Sir Charles Cayzer, Bart., and has four hters and a son and heir, Viscount Brocas, who was born in . Earl Jellicoe possesses in remarkable degree the power of ring others with his own loyalty and singleness of purpose. naval commanders since Nelson's time have enjoyed such tion and confidence as he did as commander-in-chief of the est fleet that ever set forth to do battle. (E. A.*)

LLINEK, GEORGE (1851–1911), Hungarian jurist (*see* 5), died at Heidelberg, Jan. 12 1911.

NA, UNIVERSITY OF (*see* 15.315).—In 1910 the number of ents was 1,946 and in 1925 it had risen to 2,153, when it had oreign students, of whom 69 came from Latvia and 49 from ia. The faculty of medicine is specially attractive to foreign ents. The university library possesses 325,000 volumes and ge collection of pamphlets.

NSEN, JOHANNES VILHELM (1873–), Danish author, born at Farsö, North Jutland, Jan. 20 1873, of a family of ant extraction. He studied at the University of Copenhagen afterwards travelled extensively, writing a number of novels, hes, essays and letters of travel and some volumes of poetry. en belongs to the new school of Danish literature which into being about 1900. Influenced by Whitman, Kipling H. C. Andersen, he repudiated the Brandes school with its ation of French literature and wrote of nature and outdoor Among his novels may be mentioned: *Kongens Fald* (1899–), a historical novel of the 16th Century; *Madame d'Ora* 4); and *Den lange Rejse* (1908–21) describing the evolution he Northern race from the glacial epoch to the time of mbus. In *Himmerlandshistorier* (1898–1910); *Skovene* (1904); *tiske Noveller* (1907–15) and *Myter og Jagter* (1907–24) he ribed life and scenery in his native country and abroad with ant imaginative talent and mastery of language. Jensen, became a firm believer in evolution, adopted in later years rely atheistic and biological view of life. See Otto Gelsted, *nnes V. Jensen* (1913).

NSEN, WILHELM (1837–1911), German author (*see* 15.321), near Munich Nov. 24 1911. His last work was *Fremdlinge r den Menschen* (1911). See W. Barchfeld, *Wilhelm Jensen yriker* (1913).

RSEY CITY, N.J., U.S.A. (*see* 15.331), produced 5,000 dif- nt kinds of articles in its 1,325 industrial plants in 1925. use of the diversity of its industries and the staple character eir products, Jersey City was less affected by the War than manufacturing cities, and suffered less in the succeeding ession. The aggregate value of manufactures rose from ,775,000 in 1909 to $374,183,000 in 1919; and then, after g to $289,796,274 in 1921, rose again to $313,999,142 in 1923. The average number of wage earners in factories for the same years was 25,454; 36,981; 30,026; 33,264.

The most important new industry is the manufacture of radio apparatus and supplies, for which several plants were established in 1924 and 1925. The population in 1910 was 267,779; in 1920, 298,103, including 8,000 negroes and 76,294 foreign-born (a slight decrease), of whom 14,855 were Italians, 12,451 Irish, 12,145 Poles and 11,113 Germans. In 1925 the official estimate was 315,280. A development plan, prepared about 1920, provides, among other engineering improvements, for the construction of a bulkhead across a part of Newark Bay, by which one square mile of territory suitable for industrial sites will be added to the area of the city. By improvements in the fire department, the city secured a rating in class A for fire insurance. Boyle's Thirty Acres, widely advertised as the largest arena in the world, was opened in 1921. The opening of the Hudson Tubes (1909) gave some impetus to building in the residence section on "the hill," which was thereby brought within eight min. of the financial district of New York. The completion of the double-tube vehicular tunnel in 1926 makes the connection still closer. The commission form of government was adopted in 1913.

JERUSALEM, Palestine (*see* 15.331), is now the seat of the Government of Palestine under the mandate given to Great Britain in July 1922 and the chief town of its province. A large hospice outside the Jaffa Gate, which was built and endowed by the German Empress in 1910, is used as Government House. The population in 1922 was 62,678, of whom 33,971 were Jews. An Armenian Patriarch was elected in 1921 with the formal approval of King George, and the position of the Orthodox Patriarch of Jerusalem has been confirmed by a commission appointed by the British administration.

On Dec. 9 1917 Gen. Allenby made an unostentatious entry into Jerusalem. Military administration was carried on until 1920, when a civil administration with an advisory council was set up. Since 1917 much good work has been done in the city, which under the Turkish régime was squalid and filthy. The streets are scavenged and thoroughly cleaned, and work has been begun on a drainage system. The old and inadequate water supply from Solomon's Pools has been replaced. The ancient aqueduct leading from the springs of Birket-el-'Arub, 14 m. distant, to Solomon's Pools has been cleared, and is used in part to lead the water to a large reservoir, whence it is distributed by gravity to Jerusalem. There is a second reservoir at Lifta, giving a total supply of 150,000 gal. daily. Since the completion of the installation the amount of water used in Jerusalem has increased tenfold. A town plan and civic survey have been made and several garden villages in the neighbourhood designed. The houses have been numbered and the streets named; some roads have been widened, and in 1924 King George V. avenue was opened. Laws have been promulgated against large shop signs and advertisement boardings, a chamber of commerce has been formed and a telephone system installed.

Roads fit for motor traffic all the year round have been made to Jaffa, Jericho, Hebron and Damascus. There is, however, no longer through railway connection with Cairo, as the swing bridge over the Suez Canal at El-Qantara was removed in 1920 at the instance of the Suez Canal Co., and the canal has to be crossed by ferry. The Government department of antiquities, founded soon after the establishment of the British administration, has the archaeological schools of the different nations under its control, with the assistance of an advisory board of representatives from the schools. Previously all antiquities found their way to Constantinople, but over 6,000 specimens have now been catalogued as a nucleus of a Palestine museum at Jerusalem. Excavating is only permitted to recognised scientific bodies.

Much good work has recently been done by the Palestine Exploration Society. The citadel has been cleared of débris and modern accretions, as also the Cotton Bazaar; the ornate clock tower on the Jaffa Gate has been removed and re-erected, shorn of its trimmings, in Allenby square, and the walk on the ramparts in part reinstated. Important excavations on Mount

Ophel have also been recently carried out by the society, following earlier efforts on the site in 1909–11 and 1913–4. Remains have been found of the north wall and tower of the Jebusite fortress, which was conquered by King David and formed the site of his city; and it is hoped to discover his tomb. In 1920 the ruins of a 4th-century church of much interest were discovered by Franciscan friars in the course of digging foundations for a church in the Garden of Gethsemane, and its excavation was completed by the Dept. of Antiquities. In 1921 the ancient school of St. Etienne, founded by French Dominicans, became the headquarters of the French Archaeological Society. The foundation stone of a Hebrew university was laid in 1918 on Mount Scopus, but until 1924 there was no teaching organisation. An institute of Jewish studies was started in that year, and in April 1925 the university was formally opened by Lord Balfour. The foundation stone of an institute of physics and mathematics was laid the day after the opening of the university.

JERUSALEM, UNIVERSITY OF.—The idea of creating a university in Jerusalem was first put forward in 1882 by Dr. Schapira, *Privatdozent* in mathematics in Heidelberg. After preliminary steps it was approved by the 11th Zionist Congress in 1913, and a committee of the congress purchased a site on Mt. Scopus (near the Mount of Olives) in 1914, the foundation stone was laid in 1918 by Dr. C. Weizmann, the president of the Zionist organisation, and the university was formally opened by Earl Balfour on April 1 1925. The object of the university was twofold; to carry out research in all departments, and teaching especially in the departments of Jewish and Oriental Studies, for which the university should be a world-centre. Departments of chemistry including physical chemistry, microbiology and Jewish studies are in existence, and there is an important agricultural research institute at Tel-Avio in connection with the university. The library already contains over 120,000 volumes and the estimated recurring expenditure for 1926 is £45,000. The scientific research is especially directed with a view to the material development of Palestine. See *The New Palestine* (New York) for March 27 1925.

JESPERSEN, JENS OTTO HARRY (1860–), Danish philologist, was born at Randers, Denmark, July 16 1860. He graduated in modern languages at the University of Copenhagen in 1884 and gained his doctor's degree in 1891 by a thesis on English laws. In 1893 he was appointed professor at the University of Copenhagen. From 1909–10 he lectured at Columbia University, New York. He produced a number of books on English grammar, the history of language, general phonetics and the philosophy of language, many of which were written in English. A practical philologist, Jespersen's view of the development of language was influenced by Herbert Spencer and Wilhelm Ostwald. His most important works are *Progress in Language* (1894); *Phonetics* (1897–9); *Growth and Structure of the English Language* (1905, Prix Volney, 1906); *Lehrbuch der Phonetik* (1913); *Language, its Nature, Development and Origin* (1922); *Philosophy of Grammar* (1924).

JEWS (*see* 15.371).—The Jewish population of the world on the outbreak of War in 1914 may be estimated at about 14,900,000. Of these, two-thirds were concentrated in eastern and south-eastern Europe, including (in round figures) just under 7,000,000 in Russia, 2,250,000 in Austria-Hungary and nearly 250,000 in Rumania. Of the remainder, about two-thirds lived in the United States, which had a Jewish population of close on 3,000,000, leaving a balance of about 1,500,000 for other parts of the world. There were about 600,000 Jews in Germany, and about 500,000 in the British Empire, including 250,000 in Great Britain and Ireland.

I. THE PRE-WAR PERIOD

Events in Russia.—In the years immediately preceding the World War, the condition of the Jews in Russia went from bad to worse. The legal restrictions by which the Jews were harassed were vigorously enforced and in some respects made still more
burdensome. In 1910 there was a round-up of Jews in Ki
Jewish houses were systematically raided by the police,
hundreds of families, who were unable to prove their right
residence, were abruptly expelled. The expulsions continue
1911–2 and were extended to other cities in which only pr
leged Jews were permitted to reside—notably Moscow, St. Pet
burg and Kursk—as well as to a large number of villages
various parts of the pale of settlement, where the governme
policy was to confine the Jews to the towns.

During the same period further disabilities were imposed
the Jews in the sphere of education. In 1910 the percentage r
which limited the number of Jewish pupils to a fixed proporti
was extended to schools of surgery and dentistry and to
schools of painting and architecture in the St. Petersburg Ac
emy of Fine Arts. The percentage rule was even applied to
Jewish secondary schools, which had hitherto been exemp
as private institutions. As a result promising young Jews
Jewesses, who found higher education out of their reach in R
sia, began to leave the country in increasing numbers to pur
their studies abroad. A third line of attack was marked by w
was known as the " scheme for the Russification of commerc
This scheme, designed to drive the Jews out of Russian tra
was launched during the premiership of M. Stolypin. M. Kok
tzeff, who succeeded M. Stolypin in 1911, viewed it with misgivi
but the anti-Jewish forces were too strong for him and, thou
never formally approved by the Govt. or the Duma,
scheme was put into practical operation, existing restricti
being used to cripple public companies under Jewish mana
ment and generally to discourage Jewish commercial enterpri
In Russian Poland the Jews also suffered severely from an e
nomic boycott organised by the Warsaw Nationalists, wh
candidate for the Fourth Duma was defeated by Jewish votes
the election of 1912. At Easter, 1911, a Christian boy was kil
at Kiev. The anti-Semites at once accused the Jews of rit
murder, and a Jew named Beilis was arrested. Beilis was k
for more than two years awaiting his trial which ended in N
1913 in his acquittal.

In the Third Duma a bill for the abolition of the pale of s
tlement received a considerable measure of support, while t
Fourth Duma also contained liberal-minded elements. B
though the Jews were not altogether friendless, their positi
grew worse rather than better. The Govt. remained fixed in
determination to crush them, and Jewish life in Russia present
a picture of almost unrelieved gloom.

Jews in Southeast Europe.—In Rumania the Jews were su
jected to much the same treatment as in Russia. In one respe
their position was even worse. Jews, as such, were deemed
the Rumanian Govt. to be aliens, even though they were nat
born and had no claim to any other nationality. As a sequel
the Berlin Treaty of 1878, under which the Powers recognis
her independence, Rumania undertook in 1880 to give the Je
liberal facilities for naturalisation. Had this pledge been fulfille
their status would have been gradually regularised, but the spi
in which it was carried out is shown by the fact that betwe
1880–1913, about 200 Jews were actually naturalised out of
Jewish population, mainly native-born, of over 200,000. T
Rumanian declaration of war on Bulgaria in 1913 brought 15,0
Jewish reservists to the colours. This produced a certain rev
sion of feeling and it looked for a moment as though at last t
Jewish soldiers would now be naturalised *en bloc.* A few indivi
ual applications were granted, but the anti-Jewish forces so
regained the upper hand, and the elections of 1914 brought in
power a reactionary Govt. from which Jews had nothing to ho

In Austria-Hungary the Jews were subject to no legal dis
bilities. In 1912–3 there were various affrays between Jewi
and German or Polish students at the universities of Vien
Czernowitz and Lemberg, but these incidents, though sympto
atic, were in themselves of no great consequence. In Moroc
the Jews suffered severely from an outbreak of disorder in 19
when mutinous troops of the Sultan's army sacked the Jewi
quarter at Fez, 60 Jews being killed and many severely wounde
A considerable number of Jews were affected by the territor

ges resulting from the Balkan Wars of 1912–3, and more
cially by the transfer of Salonika from Turkey to Greece.
ng the 200,000 inhabitants of Salonika there were about
oo Jews, who played a predominant part in its commercial

h have proved not altogether unfounded.

s a result of the conditions prevailing in Russia and Rumania,
continued to emigrate overseas in large numbers. Some of
settled in Palestine, where Jewish colonisation was making
ual progress with the support of Baron Edmond de Roth-
d and under the inspiration of the Zionist Movement
great majority, however, made their way to the United
es, where 495,459 Jewish immigrants were officially recorded
e five years 1910–4 (*see* MIGRATION).

II. EFFECTS OF THE WAR

e War completely changed the face of the Jewish world.
e Russian Empire it brought the Jews political emancipa-
but it also brought them unspeakable suffering and ended
ubmerging them in the flood of anarchy which followed the
pse of orderly government. As a result, the influential
sh community in the United States increased to 3,600,000
ns. Finally, the War led up to the Balfour Declaration,
h foreshadowed the establishment under international
antees of a national home for the Jews in Palestine.

asterh Europe.—The crowded Jewries of eastern Europe
he full impact of the War from the outset. The Russian pale
ettlement became almost at once a theatre of operations.
oo, did Galicia, with its poverty-stricken Jewish population
ver 800,000. The Jews were bound in any case to suffer in
mon with their neighbours, but their miseries were aggravat-
y wholesale deportations. Within a year of the outbreak of
nearly 1,500,000 Jewish refugees had been set adrift. To
e matters worse, the Polish Nationalists vigorously pur-
their vendetta against the Jews and revived the boycott
h began in Warsaw in 1912. So pitiful was the condition
e Jews that the Russian Govt. which had already made
tantial grants to the Petrograd Jewish Relief Committee,
tually issued, as a temporary measure, a decree permitting
Jews to reside freely in any of the towns of the Empire, with
in specified exceptions, of which the most important were
ograd and Moscow. This decree was dated Sept. 3 1915.
concessions thus granted gave the Jews some relief, though
ffect was minimised by the illiberal spirit in which it was
inistered.

blic opinion was ripe for much more sweeping reforms. Of
there was ample evidence in the friendly welcome which
Jewish refugees received from their Christian neighbours in
new homes, in the action of a number of important public
es who petitioned the Govt. in favour of the emancipation
e Jews, and in the protest of many enlightened Russian
iots against a policy which they regarded as detrimental to
sian interests and inconsistent with the spirit of unity which
national crisis demanded. But the reactionary traditions of
old régime were too powerful. Nothing was done for the Jews
916, and the inquiries of other Allied Govts., which were sym-
etically interested in their case, showed that they had nothing
ope for.

was not until the revolution of 1917 that their emancipation
me a possibility. The Jews whole-heartedly supported the
lution, and one of the first acts of the Lvoff Govt. was to
e a decree, dated April 3 1917, for the repeal of "all restrictions
religious and national character." This decree at one stroke
eved the Jews of all disabilities, and it only remained for
m to take their place in the new Russia. There was much dis-
sion in Jewish circles as to what that place should be, and
re was a strong feeling in favour of what was called national
onomy, the suggestion being that the Jews should be recog-
d as a national unit and enjoy, in common with every other
ionality in Russia, a limited measure of self-government.

he Jews had hardly been emancipated before these dreams were rudely shattered by the seizure of power by the Bolsheviks. Among the Bolshevik leaders and their satellites were a certain number of Jews, none of whom, however, played any part in the Jewish community, or had any ties with it beyond their Jewish birth. The great majority of the Jews sided with the moderates and suffered accordingly under the Soviet régime. The communal organisations were broken up, and many of their leaders were imprisoned. Living, as most of them did, by trade, the Jews suffered severely from the economic débâcle which the Bolshevik revolution brought with it, and to add to their distress it became increasingly difficult to send them relief from abroad.

In Rumania the conditions of the Jews remained as deplorable as ever, though they did not suffer from the War in the same degree as in Russia. On May 11 1917, representatives of the committee of native Jews were received by the King, who gave them vague but encouraging assurances. There, however, the matter ended and nothing was done for the Jews until a limited measure of emancipation was dictated by the Germans in the Treaty of Bucharest. The relief thus granted was of little practical value, and there was no change in the policy of the Rumanian Govt., which continued to harass the Jews and treated them with exceptional harshness in the occupied province of Bessarabia.

United States.—As already stated, one result of the disruption of Jewish life in eastern Europe was that the centre of gravity tended to shift to the United States. An American Jewish relief committee, later incorporated in the joint distribution committee, was founded in 1914 and took the lead in organising relief work among the Jews in the stricken areas in eastern Europe and elsewhere. The funds raised for this purpose in the United States during the War and the post-War period are stated to have reached a total of $60,000,000. American Jewry was also active in the defence of Jewish rights in eastern Europe, though in this field at least an equally prominent part was played by the English Jews, who also contributed considerable sums for relief work. At the same time, the American Jews began to play a part of growing importance in the Zionist movement, and were concerned in the negotiations leading up to the Balfour Declaration, of which President Wilson was a consistent and influential advocate (*see* ZIONISM).

III. THE JEWS UNDER THE PEACE TREATIES

The territorial changes which followed the War closely affected the Jews of eastern and southeastern Europe. Two-fifths of them were taken over by Poland, which had more than 3,500,000 Jews among its 27,000,000 inhabitants. About 250,000 Jews were included in Lithuania, about 100,000 in Latvia and about 8,000 in Estonia. Only 3,000,000 Jews remained under Russian rule, as compared with about 7,000,000 in 1914. Of these, two-thirds were in the Ukraine. About 350,000 Jews were left in Austria and about 500,000 in Hungary, as compared with about 2,250,000 in the former Austro-Hungarian Empire. Of the remainder, about 350,000 passed to Czechoslovakia, while as a result of the annexation of Transylvania and the Bukowina, together with the Russian province of Bessarabia, Rumania increased her Jewish population from a little over 200,000 to more than 1,000,000. These changes of allegiance were in themselves not necessarily for the worse, but they involved the disruption of old-established communities and broke them up in fragments, each of which had at once to reorganise its internal life and establish a *modus vivendi* with new and in most cases none too friendly rulers.

The Peace Conference.—It was in these circumstances that the Jewish problem was brought to the attention of the Peace Conference. It presented itself in a twofold aspect. The Allies had already undertaken to facilitate the establishment of a national home for the Jews in Palestine. This undertaking held good, but it was none the less necessary to define and safeguard the rights of the Jewish minorities in eastern and southeastern Europe. As to what those rights should be Jewish opinion was divided. The east European Jews themselves, speaking through their representatives on a body known as the committee of Jewish delegations at the Paris Peace conference, demanded the recognition of the Jews in the succession states as “ national minorities ” enjoying a substantial measure of self-government. This view was supported by the Jewish delegates from the United States but was opposed by those from Great Britain and France, who limited themselves to a programme of “ minority rights ” not implying the creation of anything in the nature of a state within the state.

This more moderate claim was eventually conceded in the Minority Treaties, of which the first was signed by Poland on the one hand and the principal Allied and Associated Powers on the other on June 28 1919. This treaty makes it impossible for Poland to create a class of foreigners possessing no national status, such as the Jews had been in pre-War Rumania. Racial, religious and linguistic minorities are to enjoy complete equality before the law, the free use of their own languages, the right to control their own religious, educational and social institutions and an equitable share of public funds allotted to educational, religious or charitable purposes.

Over and above these provisions, which apply to minorities generally, the treaty specifically empowers the Jews to appoint local committees for the management of their own schools and provides that they shall not be under any disability by reason of their refusal to attend courts of law or vote at elections on the Sabbath. Poland recognises these stipulations as matters of international concern and agrees that they shall be guaranteed by the League of Nations. The league formally guaranteed the treaty on Feb. 13 1920.

Similar obligations, in each case guaranteed by the league, were accepted by Czechoslovakia, Yugoslavia, Rumania, Austria, Hungary and Bulgaria. One important result of these transactions was the emancipation of the Jews in Rumania, including the inhabitants of the old kingdom, as well as of the territories annexed as a result of the War. After the close of the Peace Conference, undertakings on the lines of those contained in the Minority Treaties, though on the whole less stringent, were secured by the Council of the League from Lithuania, Latvia and Estonia. It was only in the exceptional case of Poland that it was thought necessary to make express provision for the Jews, but if the rights which they shared with other minorities were respected, they had little to fear.

Jews in Eastern Europe.—While the Minority Treaties were being negotiated in Paris a dangerous situation was developing in eastern and southeastern Europe. The Jews were in an unenviable position, both in the succession states, where an intolerant Nationalism was in the ascendant, and in what was left of the dismembered empires, where scapegoats had to be found for the humiliations of the peace settlement. They were peculiarly exposed to attack in the atmosphere created by Bolshevism in Russia and its momentary irruption into Hungary.

The Tsarist régime had subjected the Jews to a pitiless and systematic persecution. Most of them threw themselves, when the revolution came, on to the side of the Moderates, but among them were some who, goaded to desperation, developed what may be called a destructive mania. There was no Jewish blood in Lenin himself, but both in Russia and in Hungary a prominent part in the Bolshevik movement was played by men who, though long dissociated from the Jewish community, were nevertheless of Jewish birth. In both countries the overwhelming majority of the Jews were anti-Bolshevik, not only on grounds of principle, but also because the bulk of them were traders and belonged to the very class which had most to lose from a Bolshevik victory. Nevertheless, the enemies of the Jews branded them indiscriminately as Bolsheviks, and the alarm which the Bolshevik menace excited in Europe at the close of the War gave an impetus to reactionary forces which singled out the Jews as their targets.

In Poland the Armistice was followed by a series of anti-Jewish excesses which led the British Govt. to send out Sir Stuart Samuel on a mission of inquiry. The Samuel report shows that in disorders which occurred in the year after the War not less than 348 Jews were killed and a much larger number wounded. The more serious excesses were confined to the areas of Lemberg, Pinsk and Vilna, where Poland was still at war with the Ukr
ians and the Bolsheviks, but there were spasmodic outbreak
many parts of Poland proper, and throughout the country
Jews were suffering from a sustained commercial boycott.

In Hungary, the collapse of the Bolshevik revolution un
Béla Kun led to a violent reaction, which vented itself in atta
on Jewish life and property, while the sufferings of the Jew
population were aggravated by acute economic distress. Th
were also disturbing, though less violent, outbreaks of a
Semitism in Austria and in various parts of Germany, m
especially in Bavaria. But the principal storm-centre was
southern Russia, where the Poles, the Bolsheviks and the arm
of Gen. Denikin fought over the body of the still-born Ukrain
Republic. The British Minister in Warsaw reported in J
1920 that “ the massacres of Jews by Ukrainian peasant ba
can find, in their extent and thoroughness, no parallel except
the massacres of Armenians in the Turkish Empire ” (Sir
Rumbold to Lord Curzon, in *Report of Sir S. Samuel on*
Mission to Poland, Cmd. Paper 674, 1920). It was not u
1921 that the storm began to die down. By 1922 the Sov
Govt. which was now in possession, had restored some meas
of order, but massacre was succeeded by famine and pestilen
Early in 1923 there were reported to be 100,000 homeless Jew
orphans in the Ukraine, and in Odessa the Jewish death-rate
1922 is said to have reached 200 per 1,000. In Soviet Rus
there were no massacres, but though order was fairly well ma
tained, the Jews suffered from the Communist régime, wh
deprived them of their livelihood as traders, waged war on Ju
ism in common with other religions, and was ruthless in its me
ures against “ counter-revolutionaries,” with whom it was
posed to class the Zionists and, indeed, all Jews who clung to th
religious or national traditions.

As a result of the conditions thus created in eastern Eur
200,000 destitute Jewish refugees were set adrift in the bor
land between Russia, Poland and Rumania. Responsibility
their maintenance and eventual evacuation was assumed
the Jewish Colonisation Assn. and other Jewish bodies. As
as the end of 1925 there was still a residue to be provided
but the bulk of the refugees had by that time either been re
triated to Russia or been enabled to find new homes in
United States, Canada, Cuba, Argentina, Mexico or Palest
This was only one, though it was the most poignant, aspec
the problem of the Jewish emigration. Throughout the crow
Jewries of eastern Europe there was a growing desire to esc
from conditions which seemed to hold out little prospect of a to
able future. Between 1919–23, 238,000 Jews emigrated to
United States, while between 1919–25, 67,000 Jews emigra
to Palestine. In 1924 the Johnson law virtually closed the Uni
States to emigrants from eastern Europe. There was no lo
room for immigrants in Great Britain, and Palestine stood
itself as the one country in which the Jews had in principle
assured right of entry under an international guarantee.

The Period Since 1922

Since 1922 there have been no anti-Jewish excesses on t
scale of those which occurred immediately after the War, tho
in many parts of Europe there have been spasmodic outbrea
Nor have the Minority Treaties been entirely ineffective in sa
guarding the rights of Jews, though it has occasionally be
suggested that they have not been an unmixed blessing, in
far as they may have tended in some cases to keep minori
and majorities apart. But though anti-Semitism has changed
character, it has by no means ceased to give trouble. It h
shown itself in particular in systematic attempts to limit t
number of Jews in schools and universities by means of a *num*
rus clausus. Action on these lines has been semi-officially tak
in Poland and Austria, but the leading case is that of Hungar
where a *numerus clausus* based on legislation enacted in 19
has been openly enforced. The matter has been brought befo
the League of Nations as the guarantor of the minority claus
of the Treaty of Trianon. The Council decided in Dec. 19
to take no immediate steps, in view of the Hungarian Govt.

ance that the law was an emergency measure which would nended in the near future. In Poland, anti-Semitism has ty taken the form of a commercial boycott combined with nistrative pin-pricks, the cumulative effect of which has to place the Jews at a disadvantage in every walk of life. 1924, however, the situation has shown some improvement, n the summer of 1924 a more favourable atmosphere was ed by a formal reconciliation between the Govt. and the h group in the Chamber of Deputies. There is no reason ubt the Government's sincerity, but at the end of 1925 it till to be seen whether it would be able to translate its assur- of goodwill into substantial concessions.

Rumania the emancipation of the Jews has been almost leted, and only a few exceptional cases remain in dispute. ne other hand, the Jews are living under the shadow of an Semitic agitation which gives them no peace. If they have saved from serious excesses, it is due solely to the energy which the Govt. has intervened to keep order. The is true of Austria. Vienna is a hot-bed of anti-Semitism, serious rioting took place during the Zionist congress which there in the summer of 1925. In Lithuania, where the Jews st received liberal treatment, the short-lived Ministry of sh Affairs was abolished in 1924, and the Jews, like the Poles, suffered severely from the intolerant Chauvinism which is in the ascendant. In Soviet Russia the condition of the is more desperate than in any other part of eastern Europe. where they may at least hope for better days, but under the munist régime there can be no future for the traders who the great bulk of the Jewish population.

nd Settlement and Zionism.—In these circumstances, ex- nents have been made in the settlement of Jews on the land. nese the most important is that undertaken in 1925 by the rican Jewish relief organisation known as the Joint Distribu- Committee, which has made arrangements with the Soviet . for the colonisation of an extensive tract of land in the nea. By a large body of Jewish opinion in the United States project has been viewed with misgiving, not so much on its ts, as because it has been suspected of being backed by s unfriendly to Zionism. It has thus had the indirect effect rovoking Zionist demonstrations on an unparalleled scale, inating in Nov. 1925 in a conference at Baltimore at which esentatives of almost all sections of American Jewry pledged nselves to support the establishment of the Jewish national e in Palestine. This incident served to illustrate both the ing strength of the Zionist movement and the importance ne part which American Jewry has begun to play in Jewish rs. When the Jewries of eastern Europe were engulfed in War, the centre of gravity at once began to shift to the United es, and the change in the balance of forces has since be- e yet more marked, though American Jewry is still in process uilding up a Jewish tradition. In the United States, as in land, the Jews did not escape the back-wash of the anti- itic agitation which swept over Europe after the Armistice in both countries they have been to some extent on the de- ive against hostile propaganda, though it has not been of a acter to cause them serious anxiety.

he history of the Jews as a body during the past 15 years is appily bound to be, for the most part, the history of their tions to anti-Semitism. In this somewhat sombre picture stine stands out in sharp relief as the scene of a Jewish ren- ance in which the Jews, as such, are beginning to express nselves as a constructive force. It is for this reason that the blishment in Palestine of the Jewish national home has kin- the imagination of a multitude of Jews in all parts of the d, who see in it, not merely a promise of relief for the vic- of persecution, but the hope of a happier and more digni- future for the Jewish race as a whole (*see* ZIONISM).

(L. ST.)

JEX-BLAKE, SOPHIA (1840–1912), British medical practitioner, was born Jan. 21 1840 at Hastings, Sussex. After holding a post as mathematical tutor at Queen's College, London, she studied the education of girls in America and became a pupil of Dr. Elizabeth Sewell and later of Dr. Lucy Sewell. Returning to England in 1868, in 1869 after some difficulty she was admitted with other women students to classes in medicine at Edinburgh University and in 1871 to hospitals. After attempting unsuccessfully to compel the university authorities to grant her a degree, she returned to London in 1874 and was largely instrumental in establishing the London School of Medicine for Women. In 1877 she obtained the M.D. degree of Berne and became a licentiate of the College of Physicians, Dublin. In 1878 she began practice in Edinburgh, where in 1886 she established the Edinburgh School of Medicine for women. She retired in 1899 and died at Mark Cross, Sussex, Jan. 7 1912. Her written works include *Medical Women* (1872) and *American Schools and Colleges* (1886). Her niece Katherine (b. 1860) became mistress of Girton College, Cambridge, in 1916; and another niece, Henrietta (b. 1862), became principal of Lady Margaret Hall, Oxford, in 1909. Both retired in 1921.

JIREČEK, HERMENEGILD, RITTER VON SAMAKOW (1827–1909), Bohemian jurisconsult (*see* 15.417), died in Hohenmauth (Vysoké Mýto) Dec. 29 1909. KONSTANTIN JOSEF JIREČEK (1854–1918), nephew of the above, archaeologist and historian, died in Vienna Jan. 10 1918.

JOB ANALYSIS.—This term, widely used since the World War, was applied by the personnel division of the American army to the analysis of occupational activities into their components, by means of which job specifications were drawn up showing exactly what a worker in each occupation was expected to do and be. On the basis of these specifications men were selected to fill positions such as those of chauffeur, gunsmith, etc. After the War the concept of job analysis was carried into industry, education and allied fields, where it is applied not only to the work involved in a trade or part of a trade, but also to the work involved in a profession. In view of this wide use of the term, analysis as it is employed in all kinds of occupational activities must be considered.

Though the term "job analysis" is recent, the technique it employs is not new. Under the term vocational analysis, investigators in vocational guidance have for some years analysed vocational activities into their component parts so as to secure a basis on which a person can choose a vocation. A pioneer study of this nature, *The Machinist*, was made in 1910 by Frederick J. Allen for the Vocation Bureau of Boston, Mass. Similar studies have followed in a number of other communities and for a number of other occupations. Again, the technique, if not the name, was used by the efficiency engineers of the early part of the 20th century. Taylor and others, in endeavouring to discover the unnecessary motions made by workers in industrial operations and in establishing standards of efficient performance, made analyses, dividing each job into units as minute as possible.

Community Surveys.—Educators have used the term and the method in seeking to establish a scientific basis for organising and teaching courses in vocational training. In 1914 the city of Richmond, Va., organised a survey of the community in order to discover its vocational opportunities and needs. Similar surveys followed in other cities, one of the most thorough being that of Cleveland. These surveys employed the method of job analysis, and their reports contain fairly detailed classification and descriptions of the operations involved in the various vocational activities in the communities. In addition to these surveys, analyses have been made in a more or less laboratory manner, having as their aim the dissection of vocational activities for the purpose of formulating methods of giving instruction. Under these circumstances Charles Allen formulates the steps to be taken as follows: (*a*) divide the work into unit operations; (*b*) divide each operation into operating points; (*c*) divide the operating points into two kinds, machine operating points and human operating points. These are then taught to apprentices as units or are put together into projects and taught as larger units.

Analyses by even more strict laboratory procedure have been carried out, chiefly by psychologists, in the effort to discover facts about learning which could be put to use in the training of apprentices. Bryan and Harter investigated telegraphing and discovered the rate at which learners could receive and send at various stages of their progress. Book made a similar study of typewriting. Wells and, later, Hoke investigated, among other things, the nature of the errors which a typist makes. On the basis of these facts a teacher of typewriting can direct a learner in the avoidance of errors and the more rapid acquisition of skill.

Procedure.—Analysis should be made from a number of points of view. Especially is this necessary when made for the purpose of drawing up job specifications or qualifications that must be possessed by the worker. Economic questions should be answered, such as how much money may be earned, how the demand for workers fluctuates, etc. From the physical point of view the analysis should specify the movements that the worker makes, the weights to be lifted and the like. Physiological data should be gathered showing such things as preferable age, height, sensory acuity and also liability to accident or to occupational disease. The psychological phase of the analysis involves a statement of the mental processes involved in the work, the degree of intelligence required, amount and kind of education, temperamental requirements. From the sociological point of view, inquiry should be directed toward the class of workers engaged in the occupation, their nationality, family status, etc. Thus true analysis requires and results in a complete, all-round view of occupational activity.

Prominent Errors.—In carrying out such complex investigations some mistakes are made, such as those due to the temptation to rely on opinions obtained by questioning workers and their employers. This "questionnaire method" has received severe condemnation from scientists and should be used sparingly by investigators in the field of job analysis. In the first place it yields chiefly opinions showing what some one thinks the work is like. Secondly, it usually states the components of the job in general, abstract words such as "accuracy," "quickness" and the like, which do not characterise any occupation in particular, being required in hundreds of different jobs.

Too great dependence on psychological tests is another error. There is a procedure whereby a number of psychological tests are chosen which seem to resemble the work being analysed. Those tests in which the good workers excel and the poor workers fall short are considered to call forth the same mental activities as those required in the job and to constitute therefore the analysed components of the work. As a matter of fact such an assumption is not valid. The activities called forth by the tests are merely test-activities and nothing more. No one can say that they are identical with the psychological processes of the work under consideration.

Scientific Method.—In formulating a procedure which promises scientifically valid results, and will be applicable regardless of the ends for which an analysis may be made, the underlying requirement is that the procedure must conform to the rigid technique of scientific method. It must be unbiassed and dominated only by the desire for the exact determination of co tions. Thorough analysis can be carried on only by trai scientists, though they must have the co-operation and assista of experts in the occupational fields as well.

In conducting an analytic investigation the first task is survey the entire vocational field in which the activity lies, determine its relation to the social organisation, then to div it into its occupational sections. These are to be describe terms of their relations with each other and their relation to whole field. Then each occupational section is described divided into smaller units. This division may be made by n observation, and the operations may at first be describe qualitative terms, but the descriptions should also be couc in quantitative terms.

Use of Measurements.—Measurement is an indispensable p of the process. The early quantitative analyses of Taylor w made with a stop-watch reading in fifths of a second. As principle of measurement has become more widely extend however, there has come a demand for measurements of grea precision, made with instruments used in the psychologi laboratory for the measurement of intervals of time as small one-thousandth of a second. For example, pictures have be made of the eye-movements made by proof-readers. T chronocinematographic method of Gilbreth offers much prom for the exact measurement of motions and time intervals invol in work operations. Motion pictures of the worker at his w are taken, in which is placed a clock that measures time millionths of an hour. The background in each picture is cro sectioned into squares of predetermined size. By examining t exact position of the worker in each succeeding picture in relati to these squares and to the time-recorder it is possible to det mine how much he has moved and at what rate.

Developments in Britain.—Excellent analytic work is being do in England by the Industrial Fatigue Research Board, organis during the World War for the purpose of assisting workers to do th work with as little fatigue as possible. The board has made analyti investigations on such matters as rest pauses, conditions affec accidents, elimination of waste motion. Though these analyses w instituted primarily to discover and eliminate the causes of unne sary fatigue, the results have been found useful in other ways, esp cially in giving a basis for more effective training of apprentices.

Some indication of the fundamental part which job analysis c play will be furnished by this list of ends which have motivated t various analyses that have been made: elimination of waste m tions; determining standard day's tasks; wage setting; figu accurate costs; arranging grades and routes of promotion; invent trade tests; establishing a curriculum for vocational educatio determining methods of teaching vocational activities; securing basis for choice of a vocation; securing job specifications for the s lection of workers. *See* also INDUSTRIAL PSYCHOLOGY; INTELLIGE TESTS.

(H. D. K.)

JOFFRE, JOSEPH JACQUES CESAIRE (1852–), Fren soldier, was born Jan. 12 1852 at Rivesaltes, at the edge of th Eastern Pyrenees. According to a tradition preserved in th family, his stock is Spanish and noble, and its proper name Goffre. His great-grandfather fled from Spain for polit reasons, came to France, gave his name the French spelling Joffre, and became a merchant. The grandson of this fir Joffre adopted the trade of a cooper. He had 11 children, o of them being the future victor of the Marne.

The studies of young Joffre at the École Polytechnique we interrupted by the Franco-German War and he took part in th defence of Paris in 1870. Afterwards he passed out from th Polytechnique into the engineers and worked on the fortificatio of Paris. In 1876 he was promoted captain. The loss of hi wife so affected him, however, that he applied for a transfer t

-China, where he took part in the occupation of Formosa 85 and remained three years at Hanoi as chief of engineers. 888 he returned with General Mensier to Paris. In 1889 itered the railway regiment. In 1892 he was sent to Senegal uild a railway from Kayes to Bafoulabe. At the end of , a column commanded by Colonel Bonnier marched on buktu *via* the Niger. Joffre, who was a major, was ordered rm a second column, which was also to march on Timbuktu he left bank of the river. He left Segou on Dec. 27, to ve the news at Goundam at the end of Jan. that Colonel nier had been murdered on the 15th. Nevertheless, he coned his march on Timbuktu undaunted, and entered the n on Feb. 12 1894 after marching 813 kilometres. Some s later he went to Madagascar to form the base at Diego-ez. He was appointed general of brigade in 1900 and ral of division in 1905. While commander of the II. Army s at Amiens he was called to the Conseil Supérieur de la rre in 1910. This council, re-established in 1872, consisted ne generals who in time of war would have the chief comds. General Joffre was entrusted with the direction of the of communication.

nder the system then existing, the vice-president of the her Council became in time of war commander-in-chief of armies in the field. But in time of peace he had very little hority over his future subordinates. He could not determine er promotion or commands. The real authority lay with the f of general staff of the army. General Michel, vice-president he Higher Council, resigned in July 1911, and the Minister War, M. Messimy, decided to unite the functions of vice-sident and those of chief-of-staff of the army in one person, hat in the eventuality of war, the chief of the general staff ld become commander-in-chief. Who was to exercise these ted duties, which constituted a position of considerable power? Messimy thought of General Pau, who refused on the und that he had only 18 months' more service on the active . General Galliéni was due to pass into the reserve even ner. M. Messimy's choice accordingly fell on Joffre, who only 59 years old, and had therefore five years more on the ive list.

or three years Joffre exercised complete authority over the y. He had laid his plan of campaign, known as Plan 17, ore the Conseil Supérieur on April 18 1913. Germany having lared war on France on Aug. 3 1914, he took up the post of mander-in-chief on the 5th. From this day on, the history his life for more than two years was that of the War itself. is silent general, jealous of his authority but undismayed by most tragic events, had to bear on his broad shoulders a ght which only his coolness and energy enabled him to tain. After having attempted in vain to throw himself on flank of the advancing Germans, he was obliged to withdraw left wing a considerable distance. He resumed the offensive Sept. 6, and threw the Germans back to the Aisne in the morable battle of the Marne. He attempted then to turn ir right wing, a frustrated manoeuvre which ended with the al fronts resting on the sea. The Germans first made the empt to break the allied line on the Yser in Nov. 1914, and y failed. The French, in turn, tried vainly to break the rman front in Champagne, in the Woevre, in Artois and ultaneously in Artois and Champagne (Sept. 1915).

These checks, following on rash promises and high hopes, had rmed public opinion. A campaign was conducted against the mmander-in-chief, on the one hand by the friends of General lliéni, who accused general headquarters of having stolen the ry of the Marne; and on the other by the yet more powerful ends of General Sarrail, whom General Joffre had relieved of command in July 1915. They reproached general headarters for their blind confidence in 1914. They accused Joffre rejecting all superior authority and organising a regular vernment at Chantilly. So long as Millerand was Minister War he protected the commander-in-chief. But Millerand s replaced on Oct. 30 1915 by General Galliéni. Joffre had rved under the latter at Madagascar, and Galliéni had suggested Joffre to Messimy in 1911 for the post of chief of general staff. But at the beginning of the War, Galliéni, although designated successor to Joffre, had been left as military governor of Paris instead of being called to general headquarters. Then came the battle of the Marne, followed by rivalry, if not between the two commanders, at least among their general staffs. On Dec. 3 1915, however, General Joffre received, instead of the simple command of the north and northeast, the supreme command of all the French Armies, an appointment which put under his authority the Army of the Orient, commanded by none other than General Sarrail. But trouble was not slow in arising. On Dec. 16 the Minister for War demanded information on the state of the defences before Verdun. On the 18th he received a stiff reply from General Joffre, who offered to resign. Galliéni answered on the 22nd that Joffre enjoyed the complete confidence of the Government. Nevertheless, two months later, on Feb. 21 1916, the Germans attacked in front of Verdun, and the defences, which were incomplete, were forced in as far as the line of forts, to a depth of eight kilometres in four days. On March 7 Galliéni read to the council of ministers a memorandum pointing out the necessity of reforming the high command. His advice was not accepted; he was also ill; he therefore resigned, and was replaced on March 17 by General Rocques.

The new Minister was a personal friend of General Joffre. Nevertheless, the campaign against him lasted throughout 1916. This was partly due to the apparently indecisive result of the great Allied battle on the Somme, and the personal quarrel between Sarrail and Joffre continued. Finally, General Nivelle, commander of the II. Army operating before Verdun, having retaken the fort of Douaumont, appeared as a possible successor to Joffre. A decree of Dec. 13 1916 conferred on Joffre the title of technical adviser to the Government in matters concerning the direction of the War. He continued to hold the title of commander-in-chief of the French Armies. General Nivelle received the command of the north and northeast—that is to say, of the French front. The Army of the Orient again became independent of general headquarters.

What was this post of commander-in-chief and technical adviser? The Senate demanded an explanation. In a secret committee, which sat from Dec. 19 to 23, M. Briand, as Prime Minister, explained the decree of the 13th. The title of commander-in-chief was left to a man who had played an historic part and who deserved every consideration; but it implied no authority either over General Nivelle or General Sarrail, who remained free to conduct operations as they wished. Joffre would be consulting member in the War committee, which was merely an organ of preparatory work, its decisions being submitted to the council of ministers. However, on Dec. 13, M. Briand had made changes in the Cabinet, and had called General Lyautey to the Ministry of War in place of General Galliéni. Lyautey arrived in Paris on the 24th. He considered the post of commander-in-chief and technical adviser granted to General Joffre as incompatible with the authority of the Minister of War. These two offices were suppressed, but in compensation, General Joffre was created Marshal of France on Dec. 26. In the spring of 1917 he made a journey to North America. The Academie française made him a member on Feb. 14 1918, and he took his seat there on Dec. 19th. (H. Bi.*)

JOHANNESBURG (*see* 15.431).—In 1921 the population of the municipal area was 282,921, and of the suburbs 5,210. Of the inhabitants 151,836 were whites and 6,229 Asiatics. In 1911 the population was 237,104, compared with 155,642 in 1904. Its prosperity is bound up with the gold mines of the Witwatersrand, and it is the centre for the other municipalities on the Rand. Between 1910 and 1925 the town council acquired and worked all public utility services and the live-stock and produce markets. Law courts, a town hall and a municipal art gallery were completed by 1915. In 1922 the University of the Witwatersrand was constituted; it had grown out of the South African school of mines and technology. New buildings for it were erected in Milner Park, the site being given by the town council. In 1922 the

Anglican diocese of Johannesburg was created. A cathedral in the Romanesque style was designed, the Lady Chapel being first built. On the other hand, the Asiatic and native locations at Vrededorp, within a mile of the centre of the city, remained in an insanitary and shocking condition. The South African Asiatic Inquiry Commission wrote of the location in 1920: "It is difficult to conceive a worse slum existing in any part of the world." Certain reforms followed, and in 1924 the Union Government took powers to enforce throughout the Union decent conditions in native locations.

Johannesburg was the scene of riots in 1913–4 arising out of strikes by white miners and railwaymen, and in 1915, when, following the sinking of the "Lusitania," German property valued at fully £500,000 was destroyed. In 1917 the first South Africa trade union congress was held in the city. In 1919 there were strikes and disturbances among the native workers in the mines. Early in 1922 the white miners on the Rand went on strike; the movement was captured by communists and developed into an armed revolt, with street fighting extending to the centre of the city. Prompt action crushed the revolt by the end of March.

JOHN, AUGUSTUS EDWIN (1879–), British painter, was born at Tenby, Wales, Jan. 4 1879. He received his art education at the Slade School, London, and afterwards worked in Paris, later spending some time in Provence. He became a regular exhibitor at the New English Art Club, and in 1901–2 was teacher of art at University College, Liverpool, returning to London in 1902. His earlier work includes "The Way Down to the Sea" (1906), "The Kitchen Garden," "The Smiling Woman" (1910) and "The Mumpers" (1912). For the Arts and Crafts Exhibition at Burlington House, London, 1916, he executed a mural decoration illustrating "Peasant Industry." During the World War he held a commission as official artist in the Canadian Corps, and exhibited at the Canadian War Memorial Exhibition, 1919, a cartoon for a large decoration, "Canadians opposite Lens." He was later commissioned to paint the chief characters of the Peace Conference. He also painted portraits of Mr. Lloyd George (1916), Mr. Bernard Shaw (1916), Lord Fisher (1917), Lord Sumner (1918–9) and the Marchesa Casati (1918–9). His etchings form an important part of his work, the majority being produced between 1901–10. He is represented in the Tate Gallery by several pictures, including "The Smiling Woman," "Peasant Industry," "Robin," (1917–8), and "Rachael," and in the Print Room of the British Museum. His early work, with its definite contour enclosing areas of colour, relates him to the *quattrocento* Italian painters. Distortion for personal emphasis and decorative effect is another marked characteristic. In 1921 he was elected A.R.A. The Alpine Galleries Exhibition held in London (1923) showed John's versatility and energy in astonishing degree, interest being especially roused by his portrait of Mme. Suggia, the large imaginative composition entitled "Symphonie Espagnole"—in the vein of El Greco—and the studies of "Gitanas."

JOHNS HOPKINS UNIVERSITY (*see* 15.460).—The period from 1910 to 1925 was one of marked expansion. The productive endowment rose from some $4,500,000 to more than $21,000,000. The faculty grew from 189 to 394, with 67 additional instructors in the afternoon, evening and summer courses; students from 752 to 4,260 (2,601 not being candidates for degrees); the library from 148,242 to 273,652 bound volumes. Frank Johnson Goodnow, of Columbia University, constitutional adviser to the Republic of China, succeeded Ira Remsen as (third) president in Oct. 1914. Upon an initial state appropriation of $600,000, continued by annual grants of $50,000, a School of Engineering was opened in 1913, with instruction in civil, electrical and mechanical branches, extended in 1924 to include gas engineering, through gifts of the Southern Gas Assn. for five years. For this school two laboratories and a powerhouse have been erected.

In 1916 the move from the old site to Homewood was completed except for chemistry, which occupied its new laboratory in 1924. The tract is expertly developed, the arrangement of buildings a Latin cross, the style Colonial. A war memorial
dormitory was opened in 1923 in the name of the alumni.
ingeniously equipped laboratory in plant physiology, bota
garden and arboretum, athletic fields and concrete grand-s
complete the development to 1925.

In 1909 the university, in co-operatoin with Goucher Col
initiated college courses for teachers (now the College
Teachers); in 1911, summer courses; in 1916, evening cou
without degrees, for technical workers and in business econo
Extension to other state centres was authorised in
A School of Business Economics, providing academic trai
for business careers, and conferring the degree of Bachel
Science in economics, was opened in 1922.

Teaching in Medicine.—Medical development was
nounced in this period. The university received from
to the present, gifts and grants to about $20,000,000.
clinical departments of medicine, surgery, pediatrics, ob
rics, psychiatry and ophthalmology were placed on a
time basis. The General Education Board led with sev
large grants in all these cases, besides two laboratori
the new Hunterian (1915) and the pathological (1923)—
$3,000,000 for expansion now in process, including cen
heating plant (1925). Capt. Joseph R. DeLamar, who
in 1918, left bequests amounting to over $3,700,000 to d
In 1923, $2,000,000 was voted by the Carnegie C
for a new dispensary, and a similar amount was raised
endow the university Dept. of Psychiatry and the Phi
Psychiatric Clinic at the Johns Hopkins Hospital, one-
coming from the founders, Mr. and Mrs. Henry Phipps.
1925, the Wilmer Ophthalmological Institute, named after
first director, Dr. William Holland Wilmer, with endowm
of the university Dept. of Ophthalmology, was established at
hospital on a fund of $3,000,000 raised. Advanced ophthal
logical training in America is thus for the first time possi
The university has also profited from the establishment of
three other clinical institutes at the hospital, Harriet L
Home for pediatrics (1912), Brady Urological Institute (19
and the Woman's Clinic for obstetrics (1923), all teach
hospitals staffed from the school.

In 1918, under the direction of Dr. William H. Welch, assis
by Dr. William H. Howell, former dean of the School of Me
cine, a School of Hygiene and Public Health was opened, w
an annual grant from the Rockefeller Foundation, which
1922 became an endowment of $5,000,000, with another milli
for a building, which was completed and occupied in 19
This is the only institution of its kind in the United States, a
placed alongside the Hospital and the School of Medicine,
creates one of the strongest medical centres in the Americ
The main objects of this school are to train for public hea
work, promote investigation and disseminate sound hygie
knowledge. The degrees granted are Doctor of Public Heal
Doctor of Science in Hygiene and Certificate in Public Heal
Of the 150 students enrolled in 1924–5, 42 came from forei
countries. In 1925 the Institute of Biological Research w
established on a five-years' grant from the Rockefeller Found
tion, and in the same year announcement was made of t
Walter Hines Page School of International Relations, a pion
memorial to a former fellow. A minimum endowment of $1,00
000 was being sought in 1925, and it was announced that t
school was expected to open in 1927.

Scientific Expeditions.—The university dispatched four scie
tific expeditions abroad during this period, two botanical
Jamaica in 1910 and 1919, and two geological to South Ameri
for the first detail cross-section of the Andes, in 1919 and 19
while a fifth, to the Near East for archaeological explorati
and excavation (1924), was under the conduct of a faculty me
ber. Publication was very active, a current report recordi
some 600 printed contributions a year.

War Services.—The institution's service in the World War w
prompt, notably its staffing of Base Hospital No. 18, whi
crossed with the first contingent and provided the A.E.F. wi
its chief consultants in medicine, surgery, genito-urinary di
eases and medicine to the Air Service. An ambulance unit w

nised. Schools of navigation and marine engineering, under Shipping Board, were operated. The laboratories were turned to experimentation, while large numbers of the faculty students scattered to a great variety of service, field and ian. Twenty-four, who made the supreme sacrifice, are norialised on marble in Gilman Hall. (M. L. R.)

OHNSON, HIRAM WARREN (1866–), American politi- , was born at Sacramento, Cal., Sept. 2 1866. He entered University of California, but did not finish his course. He ime a reporter, at the same time studying law in his father's :e; was admitted to the bar 1888, and practised with his father his brother in Sacramento. In 1902 he opened an office in Francisco, where he became widely known in 1906–7 for vigour and success with which, as prosecuting attorney, he :eeded against dishonest public officials and corporations. was elected Governor of California for the term of 1911–5; in 1912 was an unsuccessful candidate for vice-president the ticket with Theodore Roosevelt), as nominee of the National Progressive party, which he had helped to organise. As ernor he signed in 1913 the Webb anti-alien bill, designed to hibit the ownership of land in California by Japanese, although the President had asked for delay. He was re-elected ernor 1915–9, but resigned in 1917, having been elected a . Senator. He opposed many of the policies of President Wil- 's administration and declared that a league of nations would olve the United States in European wars. At the Republican tional Convention in 1920 he had considerable support as sidential candidate, especially from those opposed to the igue of Nations and the Treaty of Peace as submitted to the iate. He was re-elected U.S. Senator for the term 1923–9.

ONES, ROBERT EDMOND (1887–), American theatrical igner, was born at Milton, N.H., Dec. 12 1887. He graduated n Harvard University in 1910 and began designing scenery the theatre in New York City the following year. He attcted attention by the boldness and originality of his concepis and exerted a marked influence in American theatrical art. iong the plays for which he designed the stage settings were *Man Who Married a Dumb Wife*, for Granville Barker (1915); *e Jest* (1919), *Richard III* (1920) and *Macbeth* (1921), for hur Hopkins; *The Birthday of the Infanta* for the Chicago era Association (1920); and *Beyond* and *Desire Under the Elms* the Provincetown Playhouse (1924). He published with K. cGowan *Continental Stagecraft* (1922) and *Drawings for Theatre* (1925).

ONES, THOMAS RUPERT (1819–1911), British geologist 15.500), died at Chesham, Bucks. April 14 1911.

ONESCU, TAKE (1858–1922), Rumanian statesman, was born Ploesci Oct. 26 1858, and after studying law in Paris was in 34 elected a deputy. He was Minister of Public Instruction Finance in various Conservative Cabinets until 1908 when founded the Conservative-Democratic party. In 1912 his oup formed a Coalition Cabinet under Maiorescu, in which iescu was Minister of the Interior. He represented Rumania the Peace Conference of Bucharest in 1913, and in 1914 he gotiated at Athens the peace between Greece and Turkey. hen the World War broke out, Jonescu was, from the first, favour of intervention on the side of the Allies. In 1918 he nt to Paris, and as head of the Rumanian national committee contributed greatly to the re-integration of Rumania in her hts as an ally when Germany was finally defeated. Jonescu s appointed foreign minister in April 1920; in the Averescu vt. and, together with Dr. Benes and Ninčić, the Czecho- vak and Yugoslav foreign ministers, he laid the foundation the Little Entente (*q.v.*). In Dec. 1921 he was entrusted by e King with the formation of a new Cabinet on the underinding that he should endeavour to govern with the same iambers. This proved to be impossible and on Jan. 18 1922 he signed. He died in Rome June 21 1922.

JORDAN, DAVID STARR (1851–) (*see* 16.406), American ucationalist and naturalist, was born at Gainesville, N.Y., Jan. 19 1851. He studied at Cornell University and at the Indiana Medical College. He was instructor in botany at Cornell 1871–2, and professor of natural history at Lombard University, Ill., 1872–3. He taught in the Indianapolis high schools 1874–5; in which latter year he was appointed professor of biology at Butler University, Indianapolis. In 1879 he became professor of zoology at Indiana University, of which institution he was made president in 1885. In 1891 he was appointed president of Leland Stanford, Jr. University, becoming its chancellor in 1913 and retiring in 1916. He was a member of the U.S. Fish Commission, 1877–91, 1894–1909; U.S. Commissioner in charge of fur, seal and salmon investigations for Alaska; and international commissioner of fisheries for Canada and the United States, 1908–10. He was active in promoting the cause of international peace, being chief director of the World Peace Foundation, 1910–4, president of the World's Peace Congress, 1915, and vice-president of the American Peace Society.

He was the author of a large number of books, among which are *Fishes of North and Middle America* (with B. W. Evermann, 4 vol., 1896); *Evolution and Animal Life* (with V. L. Kellogg, 1907); *World Peace and the College Man* (1914); *Classification of Fishes* (1922), and *Days of a Man* (autobiography in two vol., 1922).

JORGA, NICOLAS (1871–), Rumanian historian and statesman, was born at Botosani June 17 1871. At the age of 13 he was already writing articles on foreign politics in the *Românul*, a provincial newspaper. At 19 he finished his university studies in Jassy and went to Paris, Berlin and Leipzig. In 1894 he was appointed professor of universal history at the University of Bucharest. A man of great culture, Jorga made extensive researches in libraries and archives abroad and collected notes referring to the history of the Rumanian nation. As a result of his researches, he published over 20,000 documents in the *Annals* of the Rumanian Academy, of which he became one of the most prominent members.

Jorga produced numerous biographical and historical works, as well as many volumes on Rumanian art, towns, monasteries and historical monuments. He wrote several plays (historical dramas and comedies) which form part of the repertory of the Rumanian national theatres. He became also the director of *Neamul Românesc*, the official organ of the National Rumanian party. Jorga was for many years the chief of the nationalist party, which fused with the National party of Transylvania and the followers of Take Jonescu under the name of the National Rumanian party.

Among his best known works are: *Geschichte des rumänischen Volkes* (1905); *Geschichte des osmanischen Reiches*, 5 vol. (1908, etc.); *The Byzantine Empire* (Engl. trans. by A. H. Powles, 1907), and *Histoire des états balcaniques jusqu'à 1924* (1925). He also wrote numerous historical works in French, Italian and Swedish.

JOURNALISM: *see* NEWSPAPERS.

JOUVENEL, HENRI DE (1876–), French politician, was born in Paris April 2 1876. Having secured his degree in philosophy, he adopted a political career. Secretary of the committee of democratic conferences in 1900, he was made *chef de cabinet* in the ministry of justice in 1902, and *directeur de cabinet* in the ministry of commerce in 1905. He entered journalism shortly afterwards as chief correspondent on *Le Matin*. In Jan. 1921 M. de Jouvenel was elected Senator for the Corrèze. As member of the foreign affairs commission, he played an important part in the debates of the Senate, and attracted much attention by his ardour and outspokenness. He was chosen by M. Poincaré in 1922 to represent France on the Assembly of the League of Nations where he was instrumental in admitting Abyssinia to the League, and took an active part in the work of the commission of intellectual co-operation. He again represented his country in the League in 1924, and also became Minister of Public Instruction in the second Poincaré Cabinet in the same year. In 1925 he was appointed French high commissioner in Syria in succession to General Sarrail, whose administration had been signalised by serious disturbances. De Jouvenel at once set himself to the task of pacification, but realising the need of amicable relations with neighbouring countries he went to Angora early in 1926 and prepared a treaty with Turkey to be ratified by the French Government.

JOWETT, JOHN HENRY (1864–1923), British divine, was born near Halifax, Yorkshire, Aug. 25 1864. He was trained for the Congregational ministry at Airedale College, Bradford, the University of Edinburgh and Mansfield College, Oxford. In 1889 he was elected minister of a Congregational church at Newcastle-upon-Tyne, which pastorate he held until 1895 when he was chosen to succeed Dr. R. W. Dale at Carr's Lane Chapel, Birmingham. During the 15 years of his ministry there his reputation as a preacher grew steadily, and his name became known, not only throughout Great Britain, but also in America. In 1911 he went to the United States to become pastor of Fifth Avenue Presbyterian Church, New York. After the signing of the Armistice in 1918, he returned to London as minister at Westminster Chapel, Buckingham Gate, London. In 1920 his health began to fail, and two years later he was obliged to retire. He died Dec. 19 1923. In the course of his career he was chairman of the Congregational Union and president of the Free Church Council.

Jowett published a number of books of a devotional character, including *The High Calling* (1909); *Our Blessed Dead* (1909); *The Whole Armour of God* (1916); *The Friend on the Road* (1921); *Life in the Heights* (1924). See A. Porritt, *John Henry Jowett* (1924).

JOYCE, JAMES (1882–), Irish author, was born in Dublin Feb. 2 1882, and was educated at Clongowes Wood College, Belvedere College, and at University College, Dublin. His first published work was a small volume of lyrics, *Chamber Music* (1907). *Dubliners*, a set of tales and studies of Dublin personalities, followed in 1914, a novel, *A Portrait of the Artist as a Young Man*, in 1916, and *Exiles*, a play in 1918. Meanwhile Joyce had left Ireland, and lived abroad, in Rome, Zurich, Trieste and Paris. In 1922 appeared the fruit of his work between 1914 and 1921, *Ulysses*, published in Paris. This book, conceived and executed on a very ambitious scale, attracted much attention among critics and men of letters, in France as well as in England and America, as a portent of certain modern tendencies in the development of the novel; but its legally restricted sale, apart from its grammatical, verbal and moral difficulty, has left it little known to the general public.

JOYNSON-HICKS, SIR WILLIAM (1865–), British politician, eldest son of Henry Hicks, of Bexhill, was born on June 23 1865. The additional name of Joynson was assumed on his marriage in 1895 to Grace, daughter of Richard Hampson Joynson, of Chasefield, Bowdon. From 1888 he practised as a solicitor in London. He contested N. Manchester (1900) and N. W. Manchester (1906) as a Conservative, both unsuccessfully, but in 1908 he won the latter seat from Mr. Winston Churchill, who had sought re-election on his appointment as President of the Board of Trade. At the first general election of 1910, however, he was defeated. He returned to Parliament in 1911 as member for the Brentford division of Middlesex, and from 1918 represented the Twickenham Division. During the latter days of Mr. Lloyd George's administration Sir William—he had been created a baronet in 1919—was prominent among those who favoured the withdrawal of the conservatives from the Coalition, and in the Conservative Govt. which was formed by Mr. Bonar Law in 1922 he was successively Parliamentary Secretary to the Overseas Trade Department, Postmaster-General and Paymaster-General and Financial Secretary to the Treasury (with a seat in the Cabinet). When Mr. Baldwin succeeded Mr. Bonar Law as Prime Minister (1923), he became Minister of Health and, in Mr. Baldwin's second administration (1924) he was appointed Home Secretary. Sir William took an active part in the affairs of the Church of England and was recognised as one of the lay leaders of the Evangelical party. He did valuable work in connection with the development of automobilism in Great Britain—notably as chairman of the motor legislation committee of the House of Commons—and is the author of *The Law of Heavy and Light Mechanic Traction on the Highways* (1906).

JUDAISM: 1910–25 (*see* 13.186).—It is no exaggeratio
say that the 15 years under review have been to Israel a pe
of woe and disaster, as well as of consolation and hope, suc
no similar period since the Dispersion.

Russia.—The darkest part of the picture is Russia, the fo
tain in modern times of the old Jewish life and, before the W
the home of one-half of the world's Jewish population. W
the period opened, Mendel Beilis, and with him Judaism a
religion and the whole Jewish people, stood arraigned in
courts of the Tsar at Kieff to answer the hideous charge of rit
murder. In vain the friends of humanity in England, Fra
and Germany protested that this accusation of religious ca
balism was an utterly baseless libel on Judaism, an insult
Western culture, and a dishonour to those who formulate
The Russian bureaucracy recoiled from no means that wo
insure the conviction of Beilis, as it would have furnished a c
venient apologia for pogroms, past and future. However,
Nov. 1913, an all-Russian jury acquitted Beilis.

One other instance to show the atmosphere in which Russ
Judaism had to live during the last years of the Romanoffs.
the same year, at the International Congress for the Suppress
of the White Slave Traffic held in London, Hertz called the att
tion of the world to the infamy of the Tsarist " yellow ticke
by which any Jewish woman, if she was willing to be registe
as a prostitute, was permitted free and unrestricted reside
throughout the Empire; whereas all other Jews and Jewes
were confined to the pale of Settlement, which was one of
fiercest battlegrounds of the World War.

The Jewish cities were taken and retaken by the rival armi
with attendant bombardments, burnings and pillagings. Add
to these were the summary expulsions and calculated inhuma
ties which the Russian military authorities perpetrated agai
the Jewish population. As a result, scores of important co
munities were ruined, and their religious institutions, th
rabbinical academies, together with every form of Jewish c
tural activity, destroyed to their foundations. Of the survivi
communities, hundreds were later annihilated during the ma
sacres of the Jewish population in the Ukraine during the yea
1919–21, massacres that for thoroughness and extent are su
passed by those in Armenia alone.

The Russian revolution completed this break-up of Russi
Jewry and its religious life. At first constitutional, the revol
tion brought full religious emancipation to all, but in the uniq
persecution of all religion that began soon after the Bolshevi
came into power, Judaism had to suffer most. Jewish co
munists have, from the first, taken a sinister delight in t
proscription of all Jewish religious teaching—whether in t
rabbinical colleges, in the elementary religious schools or ev
in homes. Synagogues were confiscated and converted into wor
men's clubs (as late as Sept. 14 1925), and even into stables.

During 1925 the bitter fight against religion seemed to ha
relaxed somewhat, and Christian and Mahommedan bodies a
now allowed to give religious instruction to small " groups "
their children after school hours. In the case of Jews, howeve
two children have been declared to constitute a school, and su
ject to the dire penalties for teaching religion or Bible to chi
dren at a school. Religious instruction is therefore given cla
destinely, underground or in lofts and at midnight, as in t
days of the Inquisition. In Dec. 1925 two teachers were se
tenced at Kieff to six months imprisonment with hard labo

this offence; and 200 children were imprisoned at Vinnitza, olia, for refusing to betray the name and whereabouts of r religious teachers. Zionists were pursued with a Tsar-like city, hundreds of them having been banished to Siberia. use of Hebrew as a bourgeois language is suppressed.

hese persecutions called forth among the faithful remnant a fervour and a deeper self-sacrifice for their faith; but Jewish itutional religion became paralysed in Soviet Russia, and religious outlook for the growing generation is dark indeed. ore the War, the intense religious and intellectual life of ssian Jewry was duly reflected in the works of a whole galaxy abbinical, Hebrew and Yiddish writers. With the outbreak hostilities all Hebrew and Yiddish publications of any kind e forbidden. After the revolution there was a brief literary ival, which was soon strangled by the Bolshevists.

Poland, Baltic and Balkan States.—Jewish religious life has in main resumed its pre-War aspect in Poland, the Baltic and Balkan countries, despite the economic ruin of a large por- n of the Jewries wrought by racial hatred and social unrest those politically immature states. In Poland a widely rami- net of Hebrew-speaking schools, both elementary and second- , has been founded by the *Tarbuth* organisation, and is recog- ed by the Government. In Greece, the only large, and auton- ous Jewish community of Salonika is declining in conse- ence of the failure of the Greek Govt. to keep the solemn dges it gave to respect the Jewish Sabbath. Its important binate is unfilled. In Turkey, the status of all religions has dergone violent transformation under the secularising Kemal- *régime*. The activities of the Chief Rabbinate, which hither- had practically the same powers as the Patriarchates of other nominations, were limited to ecclesiastical matters, and the ngregations were organised on autonomous lines. The Chief bbi, Chacham Bashi Bijerano, introduced far-reaching reforms the Jewish law of divorce. These have, however, not found cognition with the rabbinic authorities of other lands.

France and Central Europe.—Judaism in France has been engthened by the accession of the important religiously con- vative congregations of Alsace-Lorraine; as well as by the oroccan communities now under French control. In 1924, the and Rabbi of France, M. Israel Levi, appealed to the leaders east European orthodoxy to consider the enactment, in cordance with rabbinic law, of modifications in certain aspects the Jewish marriage and divorce law (Agunah). Italian wry found itself threatened by the new education law, with compulsory Catholic instruction.

Even a graver danger is its dearth of native rabbis. In Geneva wish questions of great religious consequence are often dis- ssed. In Feb. 1925 a proposal was submitted to the League Nations Commission of Inquiry into the reform of the calen- r to introduce " blank days " (*i.e.*, the last day or days of the ar to be considered outside the calendar). As one result of this ould be a constantly backward moving day of rest, the proposal as strongly and successfully opposed by the representatives of e Jewries of the East and of the West. In Germany, Czecho- ovakia, Austria and Hungary, the War and the dire condi- ons that followed it are responsible for the impoverishment of e Jewish schools of learning and the thinning of the ranks of e scholars and students.

Literature.—Among the noteworthy productions in the study Judaism written during this period by Central European holars are the works of the neo-Kantian philosopher Hermann ohen, *Die Religion der Vernunft aus den Quellen des Juden- ms* (1919), the magnum opus of Immanuel Loew, *Flora der uden*, of Simon M. Dubnow, *Weltgeschichte des Jüdischen olkes* (World History of the Jewish People) in 10 vol. ppearing in German and Hebrew (1925, etc.), of Ismar Elbogen, *er Jüdische Gottesdienst*, on the Jewish Liturgy (1913), of . Krauss, *Talmudische Archäologie*, 3 vol., on Jewish life in almudic times, and the *Monumenta Talmudica* (1914, etc.). The ollowing savants died in the period under review: Wilhelm Bacher, Abraham Berliner, David Hoffmann, D. H. Müller, . Harkavy, A. Epstein, Hermann Cohen and Jakob Guttmann.

British Empire.—In England Dr. Hermann Adler, the Chief Rabbi of British Jewry, died in 1911, and was succeeded by Dr. J. H. Hertz. In 1913 a Yeshivah—an institution devoted exclusively to Talmudic instruction—was for the first time opened in London. After the cessation of hostilities a comprehensive educational scheme was launched as a Jewish war memorial; and in 1920 the Chief Rabbi started on the first pastoral tour ever undertaken to the Jewish communities of the British overseas dominions. The Liberal Jewish movement, inaugurated at the beginning of the century, finally established itself by the erection of a synagogue in 1925. An attempt to attach a Liberal wing to Jews' College—the theological seminary of the Orthodox congregations—met with strong opposition. In Anglo-Jewish scholarship there are Principal Büchler's learned monographs; Israel Abrahams' *Studies in Pharisaism and the Gospels* (1917, etc.); Jacob Mann's *Jews in Egypt* (1920–2); and M. Gaster's *Exempla of the Rabbis* (1924). *The Pharisees* (1924) —by R. T. Herford, a Christian scholar—is a remarkable achievement. Israel Zangwill has produced a translation of Ibn Gabirol's Poems, *Selected Religious Poems* (1923); Nina Salaman, of Yehudah Halévy; and Dr. A. Cohen, of Berakhoth, *The Babylonian Talmud* (1921). Among popular works, there are C. G. Montefiore's books *Liberal Judaism* (1903–24) and the Chief Rabbi's anthology, *A Book of Jewish Thoughts* (1917 and 1920).

The United States.—The 3,600,000 Jews of America have now their own English version of the Bible, the result of many years' labour on the part of a group of scholars, among them Solomon Schechter and Joseph Jacobs. America has acquired great Jewish libraries, that of the New York Jewish Theological Seminary (including the Elkan Adler collection) being the largest in the world. The older rabbinical colleges are workshops of Jewish learning. To these have been added the Yitzchak Elchanan Yeshivah and the Jewish Institute of Religion, representing the two religious poles in American Judaism. Of scholarly works, there appeared Schechter's *Studies in Judaism*, third series (1924), H. Malter's *Saadia Gaon* (1921), J. Jacobs' *Jewish Contributions to Civilisation* (1919) and Israel Davidson's *Thesaurus of Mediaeval Hebrew Poetry*, vol. i. (1924).

The New Diaspora.—Eastern European Jewish emigrants, fleeing from racial hatred and economic ruin, find the doors of the United States all but barred and bolted to them. In consequence, they are scattered and dispersed to distant lands where grave dangers await their Jewishness and Judaism. Outside the Argentine Republic, the fresh arrivals find in most Latin-American countries little organised Jewish life and, too often, total abandonment of Judaism on the part of the earlier settlers. The Jewish Colonisation Assn. of Paris appointed I. Raffalovich as Grand Rabbin of Brazil to lay the religious foundations of the new Jewish centres in the youngest diaspora. Mention must also be made of the praiseworthy efforts of Dr. J. Faitlovich to bring the forgotten Jewish tribes of Abyssinia—the Falashas—into touch with the general body and religious currents of European Jewry.

Palestine.—The brightest spot on the Jewish horizon throughout this period is Palestine. The beginnings of the Jewish revival in the Holy Land date from long before the Balfour Declaration, when Eliezer ben Yehudah began his gigantic undertaking to make Hebrew the language of everyday speech, as well as of instruction in schools. One half of his monumental *Dictionary of the Hebrew Language, Ancient, Mediaeval and Modern*, was published in his life-time. Palestine became the home of Ahad Ha'am—the philosopher of Zionism—and of Ch. N. Bialik, the great neo-Hebrew poet. A Rabbinate for the whole of Palestine was called into existence, with A. I. Kook (Ashkenazi) and Jacob Meir (Sephardi) as joint Chief Rabbis. A Communities' Ordinance will, it is hoped, be promulgated, providing a democratic religious organisation for the Jewish population of the Holy Land.

The zenith of the spiritual revival was reached when the Hebrew University was opened by the Earl of Balfour on April 1 1925. It may be some time before the Jerusalem University fulfils the hope of being the sanctuary of the Jewish genius;

but a land focuses a people and calls forth, as nothing else can, its spiritual potentialities. It is the ardent faith of the architects of the New Palestine that the resurrection of the Jewish people on its own soil will reopen its sacred fountains of creative energy. As of old, only a remnant will return to the land of their fathers. But it is the national rejuvenation of that remnant that may open a new chapter in the annals of the human spirit. *See* JEWS.

BIBLIOGRAPHY.—*Reports*, for the years 1911–25, of the London Jewish Board of Deputies, Anglo-Jewish Assn., and the American Jewish Committee. The surveys of the year in the *American Jewish Year Book* in *Jahrbuch für jüdische Geschichte und Literatur*, and in *The Jewish Chronicle* at the end of the Jewish Year. General summaries of the Jewish situation covering longer periods are presented in the opening addresses at Zionist Congresses and in those of the Chief Rabbi at the Conferences of Anglo-Jewish Preachers. See J. H. Hertz, *Decade of Woe and Hope* (1923). (J. H. H.*)

JUDD, CHARLES HUBBARD (1873–), American psychologist, was born at Bareilly, India, Feb. 20 1873. He came to the United States in 1879, and graduated from Wesleyan University, continuing his studies at the University of Leipzig (Ph.D., 1896). He taught philosophy and psychology at Wesleyan University, New York University and the University of Cincinnati, 1896–1902. From 1902 to 1909 he was a member of the faculty of Yale University, becoming professor of psychology and director of the psychological laboratory. In 1909 he was appointed professor and head of the department of education and director of the school of education at the University of Chicago, where he served also for a period as chairman of the department of psychology. He took part in educational surveys of Cleveland, Denver, St. Louis, the States of Texas and Utah and the New York State rural survey.

His published works include *Psychology, General Introduction* (1907); *Psychology Laboratory Course* (1907); *Psychology of High School Subjects* (1915); *Introduction to the Scientific Study of Education* (1918); and *Psychology of Social Institutions* (1926).

JUDICIAL REFORM.—By judicial reform is here meant changes in municipal law which have for their object the classification and simplification of law or improvement in the administration of justice. It includes, therefore, the more orderly expression of the law as well as changes in the training and qualifications required of members of the bar in the organisation of courts and in judicial procedure. On the other hand, the term does not include those changes in municipal law induced by changes in political, social or economic conditions. The article deals only with the United States, as changes in this direction in other countries from 1910 to 1926 have not been very serious.

Characteristics of the Bar in the United States.—Since the close of the Civil War (1865) judicial reform in the United States, though encouraged and in a sense started by general public criticism of existing conditions, has been carried out only as the result of the efforts of the legal profession.

A member of the bar in the United States is one who has a right to practise in one or more courts of record. The bar in the United States or in any state is not a legally organised body. While each member of the bar of a court has, as such, rights and duties, the members as a group are not a corporation and do not as a body have any privileges or duties. They have not the right to exclude others from being admitted to practice, or even to determine the standards which must be complied with by those seeking the right to practice. They have not the right to establish rules for the regulation of the fees to be charged clients nor to prescribe the conduct to be followed by members of the bar in the practice of law, and they cannot disbar any member of the bar for unethical conduct.

Sources of Judicial Reform.—Judicial reform in the United States, therefore, has come, not through an officially organised bar with definite legal powers, but rather as the result of the action of voluntary associations of members of the legal profession—judges, practitioners and law teachers.

These voluntary law associations are of two kinds—selective and scientific. There are over 400 selective bar associations. These choose their members from the lawyers within a definite territory rather than from the practitioners at a particular court, though, practically, they never admit a person who is not a m ber of the bar of some court. Thus, there is a national bar a ciation known as the American Bar Assn. founded in 1878, a state bar association in each of the states, as well as local associations in all the large cities and in many of the count There has been no integration of these associations. A law may be a member of the American Bar Assn., his state asso tion and his local county or city association. As the name un which they are here classified indicates, these associations all organised on the selective principle. The fact that a per is a member of the bar of a particular court, as for instance, bar of the highest court of his state, while it may be a prerec site for admission, does not entitle him to membership in a association. Before admission to a particular bar associat his application must be passed upon by a committee of the as ciation, the thoroughness of the scrutiny varying with differ associations and in the same association at different times.

With the exception of a few local associations which date fr the first part of the 19th century nearly all the local, as well all the state bar associations, and also the American Bar As have come into existence since the close of the Civil War. T several scientific legal societies are the American Institute Criminal Law and Criminology, the American Society of Int national Law, the American Judicature Society and The Ame can Law Institute. All are of comparatively recent origin. Th are all nation-wide in membership and each has been founded carry on investigation and promote improvement in law, eith generally or with reference to particular subjects. Besides th associations the Assn. of American Law Schools, composed some 60 schools conforming to certain standards of admissi organisation and conduct, has done much to promote impro ment in legal education.

The American Bar Assn. and practically all the state a nearly all the local bar associations have committees which fr time to time submit to their respective associations drafts proposed legislation relating to the organisation of the courts to procedure and other matters pertaining to judicial refor If the association approves the draft, the committee will authorised to submit it to the Legislature of the state and ur its adoption. Rules of court, as well as legislative changes in pr cedure and cognate matters, usually have their origin in t action of these bar associations.

Classification of Recent Judicial Reforms.—In recent yea such judicial reforms as have taken place in the United Stat may be classified as follows:—

1. Those designed to elevate the character and improve the e ciency of the members of the bar.
2. Those designed to improve court organisation.
3. Those designed to unify, clarify or simplify existing law.
4. Those designed to improve procedure.

Reforms Designed to Improve the Efficiency and Elevate Character of Members of the Bar.—The existing requirements admission to the bar are usually a general education equivale to graduation from a high school (the school in which studen prepare for college or university), followed by three years legal study either in a law school, or in a lawyer's office. T states require at least a year in a lawyer's office irrespective the amount of law school training received, and in some of t southern states the required period of legal study is still only t years. Comparing the present requirements with those of t last quarter of the 19th century a decided elevation of standar and improvements in the methods of examination is observ This has been due in the main to two factors: the developme of good law schools in the majority of the states, especially t schools connected with the great state universities where t tuition is practically free, and the activities of the selective b associations. Nearly all of these associations have committ on legal education and admission to the bar and in many stat these committees have been active in urging on courts and Le islatures the necessity for more stringent requirements. In th movement for the elevation of educational standards the Amer can Bar Assn. has taken the lead.

he legal training of the would-be practitioner being now, ecially in the larger centres of population, left almost exclu-ely to the law schools, the selective law associations are taking onstantly increasing interest in the ethics of members of the A code of legal ethics has been formally adopted by the erican Bar Association. In some of the larger cities committees ointed by the local judges at the instances of the bar associa-n make an exhaustive examination of the history of each licant for admission with the view to determining his char-er. There is in most of the counties and in the larger cities a mmittee of censors either appointed by the judges or by the al bar association. These committees receive complaints inst attorneys, and where they believe the complaints well nded and the matter serious, institute in the courts proceed-s for disbarment.

Reform in the Organisation of State Courts.—The unit of te court organisation in the United States was, and largely l is, the county or a unit called the judicial district composed one or more counties. The principal trial court of each county district is independent of similar courts in other counties or tricts of the state. From each of these county or district urts there is an appeal on questions of law to an appellate urt of state-wide jurisdiction. In some states there are two pellate courts, one for cases involving comparatively small ounts, and in some other states a system of intermediate pellate courts, the case on appeal going from the trial court st to the intermediate appellate and finally to the highest court. As legal business in the larger states increased the first tend-cy was to create two or more county courts with co-ordinate isdiction in the counties in which a city was situated. Thus, the city of Philadelphia, which is territorially co-terminus th the county of the same name, there are five separate courts ch having identical civil jurisdiction.

The striking feature of the state court organisation in the ited States is the absence of any co-ordination of the various te courts for the efficient carrying on of judicial business. me progress has been made toward better co-ordination. In ny states, as in New York, the state has been divided o judicial districts, each district including several coun-s, though the extent to which the courts in each district ve been welded into a single and simple organisation ries. Again, in some states power has been given to the ghest appellate court, or to the chief justice of such court to nsfer temporarily a judge sitting in one county or district ich has little judicial business to a county or district where e judges need assistance. There still remains, however, though varying degree in the several states, much to be desired in the y of greater unification of court organisation.

Though little definite progress toward this goal has been made the last 25 years, there now exists a general recognition of its portance. Perhaps on account of the difficulties involved, the itial steps toward better court organisation have come, not so uch through the selective bar associations as through a single ientific legal association—the American Judicature Society. his society was organised in 1913. It has drafted acts estab-shing a unified system of courts for a large municipality and r a state as a whole. The reforms embodied in these acts usu-ly involve changes in state constitutions as such constitutions variably contain at least the general framework and often the tailed organisation of the state courts. The more recent state nventions called to draft new state constitutions have embodied part at least the suggestions of the society, but the constitu-ons themselves have failed of adoption, though the failure nnot be ascribed to the embodiment of the reforms suggested ut rather to a general reaction on the part of the electorate gainst any constitutional changes. In Louisiana a partial adop-on of the suggestions of the society has been effected, and one ty—Detroit—has adopted a unified criminal court, the only ne in the country.

Though the record of the attempts to adjust court organisa-on to the needs of modern America is significantly small, there every sign that the next decade will witness considerable progress, and this because there has already been adopted in several important states acts which create judicial councils with power to collect data concerning judicial administration and the operation of the rules of procedure.

Reform in the Organisation of the Federal Courts.—The Federal courts, other than the Supreme Court of the United States, were re-organised by the Act of Congress of March 3 1911. Prior to the Act, while continental America was nominally divided into nine judicial circuits, the real division for all practical purposes was the district, a much smaller unit. In each district there was a district court and a circuit court, the district court having Federal criminal jurisdiction and jurisdiction in a few classes of civil cases. The circuit courts were the principal Federal civil courts of first instance. There was an appeal directly from the district and circuit courts to the Supreme Court of the United States. The Act referred to abolished the circuit courts, made the district court a court of first instance in practically all Federal civil and criminal matters and divided the United States into nine circuits, with a circuit court of appeal in each circuit to act as an intermediate appellate court on questions of law. The re-organisation of the lower Federal courts has proved of very considerable practical advantage while the establishment of the circuit courts of appeal has greatly relieved the Supreme Court. Had such relief not been given, the great increase in the number of Federal cases, owing partly to the natural growth of the country and more especially to the adoption of prohibition and its enforcement by Federal statute, would have created a congestion of cases in the Supreme Court which would have indefinitely delayed all appeals.

Reforms Tending to Unify Existing Law.—The existence of 48 separate state jurisdictions naturally leads in practice to a wide diversity in legislation. Again, while all the states, except Louisiana, have the English common law as modified to meet local conditions, there is no Federal supreme tribunal to reconcile conflicting interpretations of the common law by the highest courts of the several states, and therefore, there exists a very considerable diversity in the law. The fact that land law, or the law of inheritance, or even the criminal law varies from state to state causes little or no inconvenience. The United States, however, has attained a remarkable degree of uniformity in economic and social conditions. Economically and socially it is one nation. Diversity in commercial law, therefore, or the law of personal property, or the law of marriage and divorce is a fruitful source of much inconvenience and considerable injustice. One of the objects of the formation of the American Bar Assn. was to promote uniformity of legislation and of judicial decision throughout the United States. The group, who in 1878 founded this association, as early as 1881, began to take steps to effectuate this purpose.

The principal outcome of their efforts was the establishment in 1892 of the National Conference of Commissioners on Uniform State laws. This conference is composed of delegates appointed by the governors of the several states, usually under state Acts authorising the appointment. As its name indicates, its object is to draft statutes which it recommends to the state Legislatures for adoption. In 1925 the conference had drafted during the 33 years of its existence 34 Acts. Many of these Acts which deal with commercial subjects have been widely adopted not only by the states but by Alaska and the island possessions of the United States—the Negotiable Instruments Act by 54 jurisdictions; the Warehouse Receipt Act by 48; the Bills of Lading Act by 26. The experience of the conference would seem to show that it takes from 20 to 25 years from the adoption of a uniform commercial Act by the conference before it is generally adopted in all the more important states. The conference is not confining its activities to the preparation of commercial Acts. Its Desertion and Non-Support Act has been adopted in 21 states. On the other hand, its draft Act relative to judicial procedure in divorce and its draft Acts dealing with social legislation have met with little acceptation, though many of the provisions of such an Act as the Child Labor Act have been incorporated into subsequently adopted state statutes on the subject.

The Clarification and Simplification of the Common Law—Work of The American Law Institute.—Perhaps the most important of the legal institutions which the United States owes to England is the common law system of expressing and developing law. The fundamental feature of the system is the general judicial recognition that a decision of a court in one case has a degree of binding force when later a case arises which presents similar or analogous facts. The common law is the law developed and expressed by judicial decisions. As a whole the decisions of the English and American courts form one of the two great systems of law in force in the world to-day, the Roman Law, the ultimate principal source of the codes of continental Europe and Central and South America, being the other.

The characteristic difference between a principle of law founded on decisions of the courts and a principle expressed in a statute is that the former, or common law principle, is never absolutely binding on a court. The power that makes can always modify if the strict application of the prior rule to the instant case would, in the opinion of the court, produce injustice. The common law, therefore, has a flexibility which the law of statutes and codes does not possess. This flexibility often prevents injustice. Systems of law, however, as human beings, have the defects of their qualities. There is an element of uncertainty in the common law from which law expressed in properly drawn statutes is free. This uncertainty has not often proved a serious defect when the law is expressed and developed by one court or group of courts organised in a unified system. But in the United States with 48 separate state jurisdictions and a large number of Federal courts distinct from the state courts, the conflict between the decisions in different states and between the states and the Federal courts, as well as the uncertainty as to the law in any one state, produces the most unfortunate consequences. When law is uncertain persons with just claims hesitate to assert their rights while opportunity is given to the party with an unjust claim or defence to begin or prolong litigation. Besides all this the common law system tends to accumulate a bewildering mass of precedent.

The multiplication of decisions regarded as precedent is a growing evil even where the precedents are confined to the decisions of a single jurisdiction. But in the United States there are 48 separate state jurisdictions, each with its separate system of courts, as well as the entirely separate system of Federal courts. The reported decisions in the United States already number (1926) approximately 700,000 cases recorded in about 11,000 volumes, and to this mass there is being added annually some 153,000 printed pages. To this accumulation of American precedent must be added the decisions of the English courts and the courts of other parts of the British Empire in *pari materia*, any one of which may be cited as persuasive authority in an appropriate case. It has become manifest that the whole common-law system threatens to fall through the accumulation of an undigestible amount of authority.

The conditions described have given rise to an attempt on the part of the American legal profession to preserve the common-law system by producing an orderly expression of the common law, which, though it will not have the binding force of statute law, will at least be regarded as having an authority far superior to that accorded any existing legal treatise.

The organisation undertaking the execution of this work is The American Law Institute, founded in 1923. The institute is a voluntary organisation with two classes of members—life members and official members. The number of life members is limited to 750, the membership being confined to the leading judges and lawyers in the several states. The official members are the members of the Supreme Court of the United States, the chief judge of the court of last resort in each state, the senior judge of each of the nine Circuit Courts of Appeal, the deans of the law schools belonging to the Assn. of American Law Schools, the president and principal officials of the American Bar Assn., the presidents of the state bar associations and the presidents of the principal scientific legal societies. The orderly expression of the common law on which the institute is engaged is called the Restatement of the Law.

The work on this Restatement has been (1926) under way three years. Already tentative drafts of parts of the law of C tracts, the law of Torts, the law of Agency and the law of C flict of Laws have been printed and distributed to the memb and to the profession generally for criticism and suggestion w a view to improvement. The plan of work adopted is to have preliminary drafts prepared by a reporter for the considerat of a small group of persons especially cognisant of the subject the draft. When the smaller group of experts has, by confere and discussion, produced a draft satisfactory to it, the draf sent to the council of the institute, a body of some 33 judges a lawyers of national reputation, and later, as amended by council, the draft is distributed as a tentative draft to the me bers of the institute. The object of this elaborate machinery not only to insure that the final draft when officially publish shall be well done, but that the legal profession as a whole, es cially the leading members thereof, shall have such a part in preparation that they will feel responsible for the work and g to it on final publication that authority which it is essential should possess if it is to counteract the existing tendency towa uncertainty and confusion as to what the law is.

Whether regarded from the point of view of expenditure money, time or skilled professional labour, no work of equal i portance or magnitude has ever been undertaken by the me bers of any legal profession. Indeed, the only work to which can be compared is the work on the Code, the Digest and t Institutes of the Roman law by Tribonian and his associat undertaken at the direction of the Emperor Justinian. That wo however, as well as the modern Code Napoléon and the mo recent codes of the nations of continental Europe and Sou America have had behind them the sanction of the state. T analogous work on the common law on the other hand, is bei undertaken by the lawyers of America as a voluntary enterpris though they have turned to one of the great public foundations The Carnegie Corp.—for the necessary financial assistance.

(W. D. L.)

The Reform of Procedure

Inheriting from the colonies, which in turn had copied ar adapted it from familiar English sources, the early courts the several sovereign states followed the system of procedu in lawsuits known as English common-law pleading, a syste based upon writs or forms of action, through which certa rights could be enforced in formal manner. The rapid te ritorial extension of jurisdiction and the growth of cities, wi corresponding complexities in the nature of rights to be a serted and wrongs remedied, soon began to cause gradual mod fication in each state by statutes passed from time to time, a shortcomings in the simple legal machinery of formerly rura communities were apprehended. There was no uniformity i these efforts, but generally speaking, such legislative alteratio were limited in scope, probably because usually inspired by di ficulties arising in specific cases, and the principal outlines common-law pleading remained intact. During the first half the 19th century, the chief result of these improvements wa to permit some fusion of the forms of equity with common law

However, in 1848, New York adopted a Code of Civil Pro cedure introducing a system of procedure and pleading which wa rapidly copied by other, and adopted by new, states until to-day it is in use in well over half of all. This was the culmination of a agitation and effort for procedural reform largely led by Davi Dudley Field, based upon earlier writings of Jeremy Bentham i England, Edward Livingston in Louisiana, and Napoleon's Code of Civil Procedure. The objects of the New York Code whose provisions can be found almost verbatim in most other American procedural codes, were to consolidate all forms, writs and causes of action into one simple universally applicable form, to remove all distinctions between law and equity, to permit free joinder of parties and causes of action, and to substitute for the previously highly technical and formal language used in the written statements required of parties, a simple, cogent and natural style of expression more in accord with the practice of daily life.

ith regard to all but the last of these objects, the code has successful. Its benefits were felt even in England, where its nple was persuasive in forwarding the reforms introduced by Common Law Procedure Acts of 1852 and 1860, and later the t Judicature Acts of 1873 and 1875. These, in turn, influ- ed the American Codes, which, since their first enactment, e not remained static but have, just as has the procedure in so-called common-law states, been frequently amended and, ome cases, improved, by legislative act. In many non-code es most of the procedural reforms of the codes have been pted without wholly abandoning distinctions and formulas itionally dear to practitioners trained to revere them.

hile the Federal Courts in each state are required by the formity Act to follow the procedure of the state in actions w, they are free of such restriction in proceedings in equity, on that side their practice is uniform throughout the country. Federal Equity Rules of 1912, promulgated by the Supreme rt in that year, are another landmark in the struggle for rm of procedure, simplifying and modernising, as they did, chnical but important class of litigations, not only locally but very state in the Union.

ince the great period of commercial expansion which culmi- ed in the Spanish-American War, the best minds at the Ameri- bar have more and more had forced upon them an apprecia- of the inadequacy of the courts to dispose efficiently of the me of work being brought into them. Inspired by the delays uncertainties which marred the work of the regular courts of , two strong movements away from the courts have mani- ed themselves. First is the tendency to create administrative si-judicial tribunals, manned presumably by experts and un- pered by the traditions and rules of evidence and procedure ch strike the average layman and legislator as being responsi- for the clumsiness of the courts. In Federal matters instances the Interstate Commerce Commission, the Federal Trade nmission, the appeal boards for taxes and customs, and num- us minor bodies in government departments; in the individual tes the Workmen's Compensation Boards and the Public lity Commissions show a similar drift.

nsofar as such bodies relieve the courts of difficult and hnical questions of fact, they are an unmixed blessing; at same time it is unavoidable that they are creating, each in its uliar field, bodies of precedent and law which are making ever re difficult and multifarious the science of jurisprudence. The ond tendency away from the courts is the reaction of the iness man rather than the legislator, impatient of the ignorance uries and the stump speeches of eloquent counsel. This induces growth of arbitration of commercial disputes by trade bodies organisations on behalf of their members. Large classes of nmercial differences are thus kept out of the courts and, as owledge of the benefits to be gained by this method, and nfidence in it, spreads, it will be more and more resorted to. In another direction it has been sought to improve procedure creating special courts such as courts for administration of ates of decedents, municipal courts with strictly urban juris- tion, juvenile courts, domestic relations courts, conciliation urts and similar divisions. In these cases, the procedure pre- ibed is generally less elaborate and more expeditious and *ad minem* than in the courts of general jurisdiction. To suppose, wever, that there is satisfaction with the results so far ac- mplished is an error, for many influences are at work to gative the value of the real improvements which have been tempted.

To-day, the greatest promise for reform in methods of pro- dure lies in the spread of admiration in the U.S.A. for the suc- ss achieved by the English courts in simplifying procedure, der the system introduced in the Judicature Acts, by which ocedure is regulated not by statutory enactment but by flexible les made by the courts themselves. A strong movement has veloped for the adoption of this system both in the Federal urts and in the state courts in the U.S.A., forwarded by the itings and utterances of Chief Justice William H. Taft and r. Elihu Root among public men, Dean Roscoe Pound of Harvard, Dean John H. Wigmore of Northwestern and Prof. Edson R. Sunderland of Michigan among scholars, Thomas W. Shelton of Virginia, Moorfield Story of Massachusetts and others among practising lawyers, and most of all, by the American Judicature Society and its secretary, Herbert Harley, under the munificent endowment of Charles F. Ruggles of Michigan. The success of the nation-wide improvement in Federal equity practice under the rules of 1912 has demonstrated the efficacy of this line of approach.

BIBLIOGRAPHY.—Roscoe Pound has prepared a complete bibliography of procedural reform which he has brought down to 1920 in the form in which it is printed in 5 Mass. *Law Quarterly*, 332. JUTLAND, BATTLE OF.—Called by the Germans the battle of the Skagerrak, this battle was fought in the North Sea between the British Grand Fleet, under Adm. Sir J. R. Jellicoe, and the German High Seas Fleet, under Adm. Reinhard Scheer, on May 31 1916. The scene of the main action was about 75 m. from the Dutch coast in the neighbourhood of lat. 57° N. long. 6° E. The encounter is memorable as being the only occasion throughout the World War on which the rival battle fleets met, also for the fact that it left the British fleet undisputed master of the German one up to the day of the latter's surrender. As a test of modern naval material it was prolific in lessons for both sides.

I. INTRODUCTORY

The movements of the fleets and squadrons were necessarily governed to a large extent by highly technical considerations, and the battle is not an easy one for the layman to follow without a painstaking study of its successive phases and the motives which produced them. Moreover, in order to obtain a true perspective of events it is necessary to keep in mind the following fundamental facts:—

(*a*) The Allied cause rested absolutely on the retention by Britain of that sea supremacy of which the Grand Fleet was the fulcrum.

(*b*) By the date of Jutland Germany's surface navy had already been rendered largely immobile and her mercantile marine had been swept off the seas.

(*c*) It was the definite policy of the British naval command to bring the German main fleet to action and annihilate it if possible, but there was no intention to gamble with the Allied fortunes by seeking an engagement in waters where mines, submarines and shore defences would give the enemy a definite advantage, nor under conditions where the outcome would be largely dependent on chance, such as a fleet action at night.

(*d*) It was the definite policy of the German High Command not to risk a decisive action until, by a process of attrition, the British forces might have become so weakened as to give good prospects of success.

(*e*) It was to pursue this policy of attrition that Scheer set out prior to Jutland, his object being to lure the British fleet out in the hope of falling on a section of it before it could be supported; but the last thing he intended or desired was to meet a united Grand Fleet.

The order of events can be conveniently summarised as follows:—

1. The German plan to entice the British fleet to sea while submarines were lying in wait for it, and in the hope of concentrating the High Seas Fleet on a detached part of it.
2. The sailing of the rival forces, neither realising the full significance of the coming impact.
3. The first contact and battle-cruiser action on the run south to the High Seas Fleet.
4. Beatty's run north leading the High Seas Fleet up to the Grand Fleet.
5. Jellicoe's main engagement with his combined Grand Fleet against the combined High Seas Fleet.
6. The German fleet's break-through the British destroyer flotillas at night, and the failure to send intelligence to Jellicoe which resulted in the escape of the enemy next day.

Situation before the Battle.—Adm. Jellicoe[1] has summarised the causes which led up to Jutland as follows:—

---

TABLE I.

SCAPA FLOW

Unit	Ships	Commander
Fleet Flagship and attached ships	Iron Duke 1 Destroyer 1 Flotilla Leader 1 Light Cruiser	Admiral Sir John Jellicoe.
First Battle Squadron		
6th Division	Marlborough, Revenge, Hercules, Agincourt	Vice-Admiral Sir C. Burney.
5th Division	Colossus, Collingwood, Neptune, St. Vincent	Rear-Admiral Gaunt.
Attached	1 Light Cruiser	
Fourth Battle Squadron		
4th Division	Benbow, Bellerophon, Temeraire, Vanguard	Vice-Admiral Sir D. Sturdee.
3rd Division	Royal Oak, Superb, Canada and fleet flagship (Iron Duke)	Rear-Admiral A. L. Duff
Third Battle Cruiser Squadron, attached	Invincible, Indomitable, Inflexible 2 Light Cruisers	Rear-Admiral Hood.
Second Cruiser Squadron also attached	Minotaur, Hampshire, Cochrane, Shannon	Rear-Admiral Heath.
Fourth Light Cruiser Squadron	5 Light Cruisers	Commodore Le Mesurier.
Fourth Flotilla	2 Flotilla Leaders and 17 Destroyers	Captain C. J. Wintour.
Eleventh Flotilla (part)	1 Light Cruiser and 4 Destroyers	Commodore Hawksley.
Twelfth Flotilla	2 Flotilla Leaders and 14 Destroyers	Captain Stirling

INVERGORDON

Unit	Ships	Commander
Second Battle Squadron		
1st Division	King George V., Ajax, Centurion, Erin	Vice-Admiral Sir M. Jerram.
2nd Division	Orion, Monarch, Conqueror, Thunderer	Rear-Admiral Leveson.
Attached	1 Light Cruiser	
First Cruiser Squadron	Defence, Warrior, Duke of Edinburgh, Black Prince	Rear-Admiral Sir R. Arbuthnot.
Eleventh Flotilla (part)	1 Flotilla Leader and 10 Destroyers	Commander Sullivan.

ROSYTH

Unit	Ships	Commander
Battle-Cruiser Fleet Flagship	Lion	Vice-Admiral Sir D. Beatty.
Fifth Battle Squadron	Barham, Valiant, Warspite, Malaya	Rear-Admiral Evan-Thomas.
First Battle Cruiser Squadron	Princess Royal, Queen Mary, Tiger	Rear-Admiral de Brock.
Second Battle Cruiser Squadron	New Zealand, Indefatigable	Rear-Admiral Pakenham.
First Light Cruiser Squadron	4 Light Cruisers	Commodore Alexander-Sinclair
Second Light Cruiser Squadron	4 Light Cruisers	Commodore Goodenough.
Third Light Cruiser Squadron	4 Light Cruisers	Rear-Admiral Napier.
First Flotilla (part)	1 Light Cruiser and 9 Destroyers	Captain Roper.
Thirteenth Flotilla	1 Light Cruiser and 10 Destroyers	Captain Farie.
Ninth Flotilla (part)	4 Destroyers	Commander Goldsmith.
Tenth Flotilla (part)	4 Destroyers	Commander Hodgson.
Attached	Engadine, Seaplane Carrier	Lieut.-Commander Robinson.

1. The pressure of the British blockade had led to insistent calls for action by the German fleet.
2. Scheer, who had assumed command of the High Seas Fleet in Jan. 1916, was chafing under his enforced inactivity.
3. A strong protest from President Wilson had caused the withdrawal of German submarines from the trade routes and thereby rendered them available for enterprises of a military character.
4. Scheer may have been led to believe that the steps announced in England to prevent a recurrence of such episodes as the Lowestoft raid, indicated that some division of the Grand Fleet was intended.

While Scheer was planning a new attack on the east coast of England, certain changes had, in fact, been made in the distribution of the British forces. Jellicoe, with the main part of the Grand Fleet, was still at Scapa Flow awaiting the completion of the outer defences of the Firth of Forth before transferring his base to the more southerly harbour, but he had detached the 5th Battle Squadron of four fast "Queen Elizabeths"[1] to repl the 3rd Battle-Cruiser Squadron of three "Invincibles," wh were at Scapa for gunnery practice, and sent them to reinfor Beatty's Battle-Cruiser Fleet at Rosyth. A third force, consi ing of the 2nd Battle Squadron, 1st Cruiser Squadron and destroyer flotilla, was based on Invergordon.

THE FORCES ENGAGED

The Grand Fleet.—Immediately prior to the battle of Jutla the following was the distribution and composition of the Bri ish forces which took part in the action:—

At Harwich were five light cruisers and about 20 torpe craft under Commodore Tyrwhitt, and at Sheerness was the 3r le Squadron consisting of the " King Edward " and the eadnought " flying the flag of Adm. Bradford. These two nands, however, took no part in the battle.

---

[1] "Barham," "Valiant," "Warspite" and "Malaya." Th "Queen Elizabeth" herself was in dock.

he High Seas Fleet.—The main German forces, in preparation Adm. Scheer's project, had been concentrated in the Jade n. They were organised as follows:—

TABLE II. *German High Seas Fleet*

Unit	Ships	Commander
et Flagship	Friedrich der Grosse	Vice-Admiral Scheer.
st Battle Squadron		
1st Division	Ostfriesland, Thüringen, Helgoland, Oldenburg	Vice-Admiral Schmidt.
2nd Division	Posen, Rheinland, Nassau, Westfalen	Rear-Admiral Engelhardt.
cond Battle Squadron		
3rd Division	Deutschland, Hessen, Pommern	Rear-Admiral Mauve.
4th Division	Hannover, Schlesien, Schleswig-Holstein	Rear-Admiral F. von D. zu Lichtenfels.
ird Battle Squadron		
5th Division	König, Grosser Kurfürst, Kronprinz, Markgraf	Rear-Admiral Behncke.

To sum up the British Fleet consisted of 37 capital ships, 8 armoured cruisers, 26 light cruisers and 80 flotilla leaders and destroyers. e German Fleet consisted of 27 capital ships, 11 light cruisers, 63 flotilla leaders and destroyers.

THE GERMAN PLAN

An order issued to the High Seas Fleet on May 18 ran as lows:—

> The bombardment of Sunderland by our cruisers is intended to npel the enemy to send out forces against us. For the attack on advancing enemy the High Seas Fleet forces to be south of the gger Bank, and the U boats to be stationed for attack off the st Coast of England. The enemy's ports of sortie will be closed by nes.

This order may be taken as defining the strategy of the enemy the above date.

In preparation for the execution of this scheme the U boats had already set out in order to be in their appointed stations by May 23, while some six or eight Flanders submarines had gone north to reconnoitre between Norway and the Firth of Forth. From that date to June 1 was the period during which it was intended to bring off the bombardment. But the weather continued to be unfavourable for airship reconnaissance. Scheer would not risk an advance on the English coast without ample warning of the approach of the British fleet, meanwhile the limit of endurance of his submarines was nearly spent.

On May 30, when he could wait no longer, he abandoned the bombarding plan and ordered Hipper, with the Scouting Forces to sail next day and to demonstrate off the southwest coast of Norway. This he anticipated would soon be known to the British Admiralty, and he hoped, by following the Scouting Force with the battle fleet, but keeping out of sight until the enemy appeared, that he might fall on a detached portion of the Grand Fleet, which would probably be sent out to protect the cruiser patrol and shipping to the northward. But events turned out otherwise.

II. THE PRELIMINARY ACTIONS

The Grand Fleet Sails.—The British Naval Intelligence Dept. was, however, already aware both of the movement of German submarines and that there was a "certain liveliness" in the Jade Roads, and Jellicoe was warned that a large operation on the part of the enemy appeared to be imminent. At 5:40 P.M. on May 30 the commander-in-chief and the admiral commanding the Battle Cruiser Fleet were sent orders to proceed to the predetermined rendezvous eastward of the Long Forties[1] in readiness for eventualities. A warning was also sent to the Harwich Forces and 3rd Battle Squadron at the Nore. By 10:30 P.M. the three sections of the Grand Fleet had left their respective bases at Scapa Flow, Invergordon and Rosyth and were heading out across the North Sea. The main battle fleet shaped course to a rendezvous in lat. 57° 45′ N. long. 4° 15′ E. where the forces under Adm. Jerram from Invergordon would meet him at 2 P.M. next day. Beatty, with the Rosyth force, was making for a point 69 m. S.S.E. of the battle fleet's position. (*see* fig. 1.) These dispositions would enable the battle fleet to intercept an enemy trying to attack the 10th Cruiser Squadron on the northern patrol, while the Rosyth force would guard against a raid.

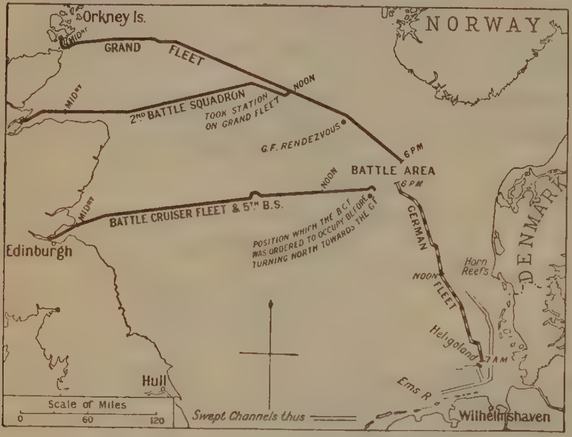

FIG. 1.—Approach of Rival Fleets.

When the British fleet put to sea 13 hostile submarines were lying off the coast; also U-67 was south of the Dogger Bank; and U-75, having laid the mines, which afterward sank the "Hampshire," was on her way home. The German submarines made few ineffective attacks; but in the main the under-water craft, as usual, proved unable to prevent free movement of the fleet.

To Jellicoe the position was by no means clear when he set out. The evidence pointed to another cruiser raid being afoot, but a misleading telegram sent from the Admiralty during the forenoon of May 31 informed him that directional wireless signals placed the German fleet flagship in the Jade river, thereby leaving Jellicoe with the impression that there was no reason for undue haste and he regulated his speed so as to economise his destroyers' fuel consumption.

First Contact.—Hipper, with the scouting forces left the Jade at 2 A.M. on May 31 and steamed northward, keeping well out of sight of the Danish coast. Scheer followed 50 m. astern with the battle fleet. During the early morning the German commander-in-chief received wireless reports from his U boats, but these proved vague and misleading, so much so that far from gleaning that a combined advance was being made by the British forces, he alludes to "our hope of meeting with separate enemy divisions" as being "likely to be fulfilled."[2]

At 2 P.M. Beatty, having arrived at his rendezvous, prepared to turn north in accordance with his instructions. Then followed one of those seemingly trivial events which are sometimes destined to have momentous issues. A stray merchant steamer attracted the attention of Commodore Alexander-Sinclair in the "Galatea," on the eastern wing of the light cruiser scr He stood on to the E.S.E. to examine her. Simultaneously "Elbing," on the western wing of the German scouting f sighted the same steamer and detached a destroyer to inv gate. Another instant and the rival warships had seen other. At 2:20, just as Beatty had turned to the northw "Galatea" hoisted the signal "enemy in sight." (See fig The result was to hasten a meeting which otherwise would, probably, have occurred further North and therefore nearer British battle fleet. Beatty at once set out to cut off the lin retreat of the enemy's light cruisers towards Horn Reefs, finding that they were apparently following the "Galat to the northwest, he hauled round more to the northward. had been steering northeast for some 10 minutes when the he smoke of Hipper's five battle cruisers was sighted on his s board bow, whereupon he turned back to the east.

Owing to the greater visibility to the westward, Hipper already sighted the six British battle cruisers, and now real that they were heading to cross his stern and cut off his lin retreat, and that he must hasten to fall back on the battle fl Beatty, knowing nothing of the greater forces to the sou could only regard this as a golden opportunity for getting grips with the enemy. There followed a hot running fight to southward between the opposing battle cruisers. The 5th Ba Squadron under Rear-Adm. Evan-Thomas which had b stationed five miles astern, panted after them trying to get i action. (*see* fig. 2.)

THE BATTLE CRUISER ACTION

At 3:34 Beatty formed the battle cruisers into single li increased to 25 knots and made for the enemy. About this ti the "Engadine" sent up a seaplane which reported Hipp course south. This is noteworthy as being the only occasion which British aircraft was used throughout the operations, the report failed to reach the battle-cruiser's flagship. At 3: however, the enemy could be made out distinctly from "Lion," and Beatty formed his ships on a line of bearing nor west to clear the smoke and bring their guns to bear, while turned to E.S.E. At about 3:48 fire was opened almost sim taneously on both sides at a range of approximately 16,0 yards.

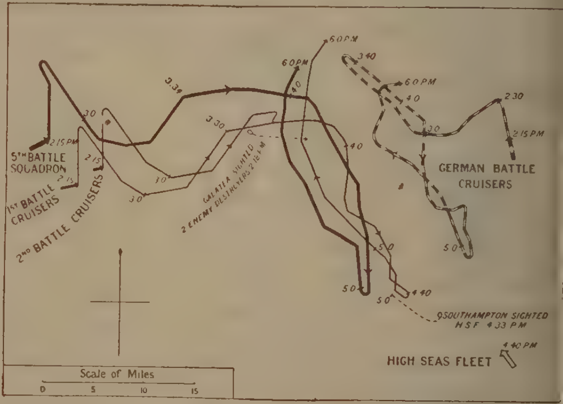

FIG. 2.—First contact and the Battle Cruiser Action. (2:15 P to 6:0 P.M.)

The British battle cruisers were at considerable disadvanta for they showed up well against the western sky, while visibili to the eastward was poor for observing their fire. German a counts agree that the British firing during this part of the acti was somewhat ragged, while they pay high tribute to that of t 5th Battle Squadron when it got within range. The better pr tection of the enemy's battle cruisers and the better shell wi which the heavy guns of his fleet generally were provid stood him in good stead, while the confusion in the interpretati of the signals for distribution of fire added to the disadvantag of the British battle cruisers.

e range was rapidly decreasing as the courses of the rival converged. A few minutes after 4 P.M. the "Lion" was ly hit by a shell from the "Lützow" which plunged into idship turret and killed nearly the whole of the gun's crew. or the presence of mind and devotion to duty of Major W. Harvey, R.M.L.I., who when mortally wounded saw to ooding of the magazine, the flagship would doubtless have destroyed. Up to this time, owing to a misunderstanding, Derfflinger" had been left unfired at, but was now engaged e "Queen Mary." In the rear of the line the "Von der " and "Indefatigable" were fighting a furious duel when o of three shells from the former crashed into the vitals British ship; she fell out of the line sinking by the stern, 6 P.M another salvo hit her and with a rending explosion rned over and sank with her 57 officers and 960 men. Now a moment's respite; both sides, finding the fighting too hot, ed to open the range, and soon the German shells were fall- ort and their fire ceased.

anwhile Evan-Thomas, by cutting corners, had manoeu- the 5th Battle Squadron into range, and shortly after 4 k the "Barham" opened fire on the "Von der Tann" at 19,000 yards. In spite of the poor visibility the battle- ' firing was very accurate, and Hipper had to take to zig- ng to dodge the great 15 in. salvoes. Nothing but the poor ty of the British shells, which burst without penetrating nemy's armour, could have saved his rear ships from de- tion. The van of the German line was not long out of n.

4:10 Hipper turned inwards two points while Beatty, having lished sufficient overlap, started to press his way to the ard again. The effect was to close the range rapidly and ngagement was fiercely renewed.

e "Lion" seems to have been still enveloped in the smoke r burnt-out turret, and practically invisible, with the result she was left in peace while the "Seydlitz" concentrated uns with those of the "Derfflinger" on the "Queen Mary." latter was fighting gallantly when at 4:26, a salvo crashed the "Queen Mary" forward, a red flame shot up and an sion rent her asunder. In another instant only a great pall oke marked the grave of this noble ship and her 57 officers ,209 men.

out this time a subsidiary battle was being fought between nes. The 13th Destroyer Flotilla, having attained a suitable ion, was launched to attack. At the same moment a Ger- flotilla advanced into the arena making for the 5th Battle dron. The two flotillas met; the enemy destroyers fired e torpedoes at long range and hastily retired before the rior gun-fire of the British craft. Evan-Thomas swung his le Squadron away two points and safely avoided the tor- es. Part of the British flotilla chased the fleeing enemy rds the van of the German battle cruisers, while Com- ler Bingham in the "Nestor," followed by the "Nicator," ued those making for the rear. When within 5,000 yd. of "Lützow," the two destroyers fired their torpedoes, but er adopted the same dodging tactics and swung his ships while the torpedoes ran clear or fell short of their mark. gallant pair of destroyers pressed on and fired more torpe- at a range of only 3,500 yd. under a hail of shell from the y's secondary armament. The "Nicator" escaped, but ight cruiser "Regensburg" appeared suddenly from behind battle cruisers and crippled the "Nestor" with two shots r boiler. The "Nomad," another destroyer, was also hit and helpless between the lines. Another small force of British royers had accounted for two of their opponents, "V.27" "V.29," when at 4:43 the "Lion" ran up the destroyers' ral recall. Events suddenly took a new and dramatic turn. ipper, sorely pressed ahead and astern, came welcome and ly relief. The German battle fleet was in sight.

rman Battle Fleet in Sight.—The head of the German battle was first sighted by the "Southampton" in which was Com- re Goodenough leading his 2nd Light Cruiser Squadron t two miles ahead of the "Lion." At 4:33, he made the signal "battleships southeast." Holding boldly to his course he was soon able to identify the High Seas Battle Fleet in full array. Mindful of the extreme importance of his information, he sent a wireless message direct to Jellicoe. Within ten minutes of this signal being dispatched the commander-in-chief had quickened the pulses of his own great command with the signal "enemy battle fleet is coming north."

Goodenough stood down to within 13,000 yd. of the enemy so that he could identify him in detail before turning north under a hail of shell fire. An admirable piece of cruiser work had not only galvanised many and far distant forces into activity, but it had crystallised the whole position for the British commands. Beatty also held his course until the German battle fleet was in sight, then, at 4:40, he turned 16 points in succession and started the run north, assuming the rôle of the pursued instead of that of pursuer. To Scheer it seemed as if his opportunity to fall on a detached part of the British fleet had come, but Beatty was happy in the knowledge that if the enemy was not frightened off prematurely he would be confronted with the whole Grand Fleet.

Fortunately Hipper was too occupied with the British destroyers' attacks to be able to take advantage of the target presented by the British battle cruisers as they wheeled in succession round the same point. By 4:50 Beatty with his line now reduced to four ships had straightened up on a northerly course and was re-engaging his late enemy. Hipper had just resumed his southerly course, after turning away from the British destroyers, when a torpedo hit the "Seydlitz" tearing a huge hole under water and putting a 15 cm. gun out of action. The ship's stout construction saved her, however, and she kept her place in the line. By 5 P.M. Hipper, too, had turned 16 points to the northward and taken up his station ahead of the battle fleet. Meanwhile the 5th Battle Squadron could not see the "Lion's" flag signal to turn about. Adml. Evan-Thomas saw Beatty turn, but was intent on hanging on to the rear of the enemy's battle cruisers, who were still on a southerly course, with the result that the two British squadrons passed each other at high speed. The "Lion" now repeated the signal to turn, direct to the 5th Battle Squadron, but before it could be obeyed, that squadron found itself under the guns of the German battle fleet.

Evan-Thomas turned 16 points at practically the same instant as Hipper, but in the process the "Barham" received a heavy shell which cost her casualties and the use of her wireless gear. The rear battleship of the line, the "Malaya," was a target for at least a whole division of enemy battle ships and suffered even more severely.[1] For some 20 min. she was straddled again and again and received serious damage below the waterline, but held on and eventually the whole squadron forged ahead and got clear. A plucky attempt by the destroyers "Onslow" and "Moresby" to attack the enemy battle cruisers just as they had turned north was defeated by the German light scouting group, but the "Moresby" stood on to within 8,000 yd. of the enemy's battle fleet and fired a torpedo at the third ship of the line; it did not take effect, but both destroyers escaped miraculously under a very hot fire. Scheer continued to hasten north after the apparently hard-pressed British squadrons. As he did so the motionless "Nestor" and "Nomad" came drifting down between the lines. They scorned surrender and fired their last torpedoes at the oncoming battleships but without effect. A moment later they were overwhelmed in a storm of shell. The undaunted "Nestors" gave three cheers for their sinking ship and sang a verse of "God Save the King" before the crews took to boats and Carley rafts, from which they were chivalrously rescued by enemy destroyers.

Once the 5th Battle Squadron had shaken off the German battle fleet the firing slackened. At 5:40 Hipper's squadron reappeared out of the mist and there was a temporary burst of firing from the British battle cruisers and the leading battleships, but Beatty was intent on joining his commander-in-chief and was reserving his forces for the greater issues impending.

---

[1] "Barham" lost 26 killed and 37 wounded, "Malaya" 63 killed and 33 wounded.

III. THE MAIN ACTION

Meeting of the Battle Fleets.—Coming down from the northwest was Jellicoe in the "Iron Duke," at the head of a centre division of his six lines of battleships, each in single line ahead at manoeuvring distance apart. Directly ahead of him was the 4th Light Cruiser Squadron which with the destroyer flotillas was acting as an anti-submarine screen. Further ahead and spread for scouting were the 1st and 2nd Cruiser Squadrons. Twenty-one miles to the eastward were Hood's three ships of the 3rd Battle Cruiser Squadron, with two light cruisers and four destroyers.

Up to 2:45, the fleet had been steaming at economical speed, but, with the arrival of wireless messages indicating the presence of an enemy to the southward, the commander-in-chief increased to 17 knots and ten minutes later to 18 knots. Course was shaped southeast by south for Horn Reefs as previously arranged. At 3:59, as soon as he learnt that the enemy's battle cruisers had been sighted, Jellicoe increased to 20 knots and then sent Hood on to Beatty's support, so that when the report was received that the enemy's battle fleet was coming north there was nothing better to be done at the moment than to stand on as he was doing. The battle fleet was closed up in cruising formation, and it would have been useless, indeed dangerous, to deploy into line of battle until it was known on what bearing the enemy would be met. The leaders of divisions were already disposed at right angles to the most likely line of bearing on which to sight the enemy in order that they might wheel their ships into line with a minimum of delay. So the rival battle fleets approached, charging towards each other at a rate of nearly 40 knots, but as yet out of sight.

When in due course contact was made it did not come about quite as Jellicoe expected. The "Iron Duke" and "Lion" had communicated their respective positions from time to time, but zig-zagging and many other alterations of course had caused both flagships to be out in their reckoning. The "Iron Duke" was in fact some 4½ m. ahead (*i.e.*, to the southeastward) and the "Lion" 6¾ m. to the westward of their estimated positions as they approached each other. The reports of the enemy received by the commander-in-chief were therefore somewhat perplexing, and by the time it became evident that the German Battle Fleet would be met on a starboard bow bearing instead of right ahead it was too late to alter his dispositions. Hood, also, was thrown out in his calculations. Steering as he thought to join Beatty he found himself on the opposite side, *i.e.*, to eastward of the enemy. It was at this juncture that fighting broke out with renewed vigour.

At 5:40 the Battle Cruiser Fleet converging on the 1st Scouting Group, from the westward, saw the "Lützow" and her consorts emerging from the mist. Fire was opened at a range of about 14,000 yards. This apparently disconcerted Hipper, who turned away to the eastward. Hardly had he done so before he heard the guns of the 3rd Battle-Cruiser Squadron engaging his 2nd Scouting Group. The trap was closing in on him, but as yet he was unaware of the far greater menace to the northward; but he seems to have sensed danger and at 6:34, hotly pursued by Beatty, he turned southeast only to see his light cruisers being attacked by four British destroyers. These latter he took to be the forerunners of the British Battle Fleet and, now thoroughly alarmed, he doubled right back to southwest to seek the cover of his own battleships. In fact what he had seen were Hood's light forces. These had been hotly engaged with Boedicker's 2nd Scouting Group. In the initial skirmish the "Chester"[1] was badly mauled by the German light cruisers, but they in turn suddenly found themselves overwhelmed by the fire of the three "Invincibles." The "Wiesbaden" was reduced to a wreck and the "Pillau" and "Frankfurt" were badly damaged and only escaped by using their torpedoes, which forced Hood to turn away and break off the pursuit.

The destroyers which Hipper had seen were part of the 4th flotilla. Led by the "Shark," they gallantly went for the "Regensburg" and nine or ten enemy torpedo craft which seer
be preparing to attack the 3rd Battle-Cruiser Squadron.
course of this encounter the "Shark" was severely batter
eventually sank, fighting to the last under her mortally wo
captain, Commander Loftus Jones.[2] Hood avoided this att
turning his squadron sharply to starboard; and almost
same instant he sighted the "Lion" racing up from the
ward. He turned to meet her and then swung his squadro
station ahead of the Battle Cruiser Fleet and led the lin
south-easterly course. Jellicoe was left in doubt until th
last minute as to the exact position of the enemy. Some
to the southward was the High Seas Fleet, but between hi
his adversary were battle cruisers, cruisers and dest
belching smoke and gun fire and obscuring his view. Beatt
on the heels of his own particular quarry again, had lost
of the enemy battle fleet and at the moment could not a
the commander-in-chief's urgent enquiry. Nine minute
latter waited, then at 6:10 repeated his question "Wh
enemy's battle fleet?" The first definite information came
the "Barham," now rapidly closing with the 5th Battle S
ron from the southwest. She reported "Enemy's battle
S.S.E." At 6:14 the "Lion," having regained touch, repor
too, bearing S.S.W.

The Deployment (see fig. 3).—Within a minute of the "Li
report, Jellicoe had ordered the fleet to deploy on the p
easterly column. The manoeuvre was a vital one and the
mander-in-chief made a masterly decision. Had he followe

igh standard of leadership on the part of the flag officers anding the several divisions and squadrons.

now a tragedy occurred in the foreground of this impres- ene. Up to the moment of deployment Arbuthnot in the nce" with his 1st Cruiser Squadron had been scouting of the battle fleet, but on contact being made, it became his o engage the enemy's cruisers. Boedicker's 2nd Scouting was faintly visible to the southward and, followed by the rior," Arbuthnot turned to pursue them. He was about ver a *coup de grâce* to the now blazing and disabled "Wies- ," when out of the mist came both the British and Ger- attle cruisers hotly engaged. Holding on tenaciously, close the bows of the "Lion," the two cruisers soon found them- in a hurricane of fire as Hipper endeavoured to cover the en "Wiesbaden." Two great salvoes hit the "Defence" ck succession and at 6:19 Arbuthnot and his flagship dis- red in a sheet of flame. The "Warrior" limped away, as only saved for the time being by the battleship "War- " performing an involuntary circle round her, owing to the n jamming of the latter's steering gear. Clear of the fight- he sea-plane carrier "Engadine" made a brave effort to er home, but the "Warrior" had to be abandoned at 7 A.M. llowing morning and eventually sank.

the cloud of smoke over the spot where the "Defence" one down rolled away, the full measure of his peril was re- to Scheer. The High Seas Fleet was heading into the crook rapidly extending arm of the whole combined British e Fleet. It seemed to Jellicoe a glorious opportunity to fall s enemy and crush him. The signal was actually hoisted he Grand Fleet to close, when the commander-in-chief ed that his line had not yet straightened out, and the battle ers were not yet clear of his van; to turn to S.S.E. by sub- ons, as he wished, was not practicable at the moment. He o cancel the signal and hold on on a course which neverthe- harply converged with that of the enemy battle fleet.[1]

w yet another misfortune befell the British. Proudly lead- e 10-m. line of capital ships, was Hood in the "Invincible." ng closed to a bare 9,000 yd., she was furiously engaging Derfflinger," hitting her again and again with well directed es, when the "König," leading the van of the enemy battle came to the rescue of the battle cruiser. Once again the ing shell sought the vitals of the lightly armoured British the "Invincible" was torn asunder, her stem and stern high out of the water before she disappeared (6:34). With vent Hood, who had so finely upheld the traditions of his ric name, and his splendid crew of over a thousand officers nen. The British battle cruisers had indeed suffered heavily. able as their work had been in bringing about the main ac- they were clearly unsuited for "in-fighting." From now rds they rightly confined themselves to harassing the van e enemy when opportunity served, leaving the battleships ke the shock of closer contact. But close contact was the thing Scheer was seeking. He was in a trap and needed all vits to escape impending disaster.

e possibility of such a situation had not been overlooked by German commander-in-chief, and he had practised his com- d in a manoeuvre known as the *Gefechtskehrtwendung*, which really an "emergency retirement." In this the destroyers ed out, fired their torpedoes "into the brown," and put up oke screen while each big ship did a right-about turn and ated precipitately. This manoeuvre he ordered when at he found battleship after battleship of the Grand Fleet con- rating on the head of his line. It was not unattended with , but it was boldly ordered and skilfully executed. (See 3.) In less than three minutes the evasive enemy had disap- ed for the first time. The destroyer attack had not been sed home, and, although some of the British battleship divisions swung away momentarily to avoid the torpedoes, the course of the fleet as a whole was not deflected. Burney's flagship, the "Marlborough," was hit by a torpedo, but the damage was not so great as to force her to leave the line. The German light cruiser "Wiesbaden," now the only enemy in sight, came under a heavy fire and in ten minutes, a blazing wreck, she sank from sight.

Jellicoe, too, had foreseen the problem which now confronted him, and he had not been alone in seeking, for some time past, a satisfactory solution; it was agreed by the highest tactical authorities that to follow directly in the path of an enemy's battle fleet in a position where it could obtain the maximum advantage from torpedoes and mines,[2] was sheer foolhardiness. In fact, he had already summed up the situation when he wrote "Nothing but ample time and superior speed can be an answer, and this means that unless the meeting takes place fairly early in the day, it is most difficult, if not impossible, to fight the action to a finish." In point of fact, so little was the Grand Fleet superior to the High Seas Fleet in speed that even had Jellicoe pursued it directly it is doubtful whether he would have caught up with it before nightfall. It was now 6:40. There remained little more than two hours daylight. The enemy was out of sight somewhere to the south and west, but another advantage which the deployment to port had given was the overlap to the eastward which the Grand Fleet had secured. (See fig. 4.) Jellicoe was therefore in a position to work his way steadily between the High Seas Fleet and its possible lines of retreat to the German coast, and this he proceeded to do. At 6:44 he turned his divisions southeast. Simultaneously Goodenough turned south and led his Light Cruiser Squadron to look for the enemy. By 7 he was able to report the hostile battle fleet bearing S.S.W.

Five minutes before this Jellicoe had altered course to south, and now, knowing that he was again in a position of considerable tactical advantage, he ordered a turn of "3 points to starboard together" to close more rapidly. About this time a number of reports of submarines were being made to the commander-in-chief. The "Lion" had just reported sighting one, the "King George V.," leading the battle fleet, sent a warning that a submarine was just ahead of the "Iron Duke," then the "Duke of Edinburgh" reported one "2 points from right ahead." It is now known that there were no submarines in the vicinity, but these reports could not well be ignored, so Jellicoe took the best course possible and turned directly towards the supposed menace. Incidentally this brought the course of the fleet back to south and re-formed the divisions into line ahead, the leaders being disposed quarterly. Hardly was the turn completed before the enemy reappeared out of the mist.

The Battle Fleets Re-engage

Having extricated his fleet from one trap it seems incredible that Scheer should have deliberately walked into another (see fig. 5). In his official despatch[3] he says: "It was as yet too early to assume night cruising order. The enemy could have compelled us to fight before dark, he could have prevented our exercising our initiative, and finally, he could have cut off our return to the German Bight." If ever there was a man who wanted to avoid decisive action it was the man who penned those words, yet in the next paragraph of his despatch he makes the illogical statement: "There was only one way of avoiding this: to deal the enemy a second blow by again advancing regardless of the consequences, and to bring all the destroyers to attack." The manner in which the High Seas Fleet renewed the action was such that its course was practically at right angles to that of the Grand Fleet, whose battleships were stretched across his bows so that they could concentrate on the leading German ships, while those in rear trailed astern out of action. The evidence goes to show that Scheer hoped to pass astern of the British line and thence make his way to the eastward, possibly engaging a detached force en route. If he had succeeded, he could then have made for

---

[1] The Grand Fleet deployed on a course southeast at 6:15. The oyment (excluding the 5th B.S.) was completed by about 6:40. German battle fleet approached on a northeasterly course. At , the "König," leading battleship, turned east, the remainder wing in succession (see fig. 3).

[2] Adm. Jellicoe had been informed by the Naval Intelligence Dept. that the German capital ships were known to carry mines.

, fighting a rearguard action with the attendant difficulties
s enemy.

t Jellicoe had forestalled him. The British Battle Fleet was
cross his path and, in the low visibility prevailing, the com-
er-in-chief had not risked dividing his forces. First some
y light cruisers appeared to the southwest of the "Iron
." A few minutes later, at 7:12, the 1st Battle Squadron at
orthward end of the line was seen to open fire. The "Marl-
gh's" gunnery efficiency had not been impaired by her
water injuries, and she discharged salvo after salvo at the
aig" as the head of the enemy battle fleet came into sight.
est of the squadron took up the engagement and soon the
ig German ships were smothered in shell at a range of less
9,000 yards. At 7:13 the "Iron Duke" came into action
. Once more the Grand Fleet was in a position of over-
ning tactical advantage and ship after ship joined her fire
icked out a battleship or battle-cruiser target as occasion
d. Meanwhile a small force of enemy destroyers had devel-
an attack which caused Sturdee to swing his 4th Division
two points to avoid their torpedoes. Directly the attack
expended itself, he turned back to the course of the fleet,
oximately south, which brought him into line astern of the
Division led by the "Iron Duke."

licoe had been holding steadily on his course across the
of the enemy, but seeing his rear divisions in some danger
gregation he ordered them to form astern of him, while the
ng George" was directed to lead the van into line ahead.
now the full fire-effect of the British battleships was rapidly
loping, and Scheer saw that his leading ships were in danger
nihilation; another "right-about turn" was imperative.
the enemy seemed right on top and half round him. Drastic
sures were necessary to get clear. The German battle cruisers
ld have to be sacrificed, if need be, to save the battle fleet.
made a signal to them, which, read literally, meant "charge
enemy; ram; ships are to attack without regard to conse-
nces." At the same time the destroyers, once again, were
ched *en masse* to attack.

he "Lützow" had been completely disabled in the first
act of the main engagement, and was still ablaze and out
ction. Hipper had not yet been able to get on board another
le cruiser, but Capt. Hartog, in the "Derfflinger" with the
remaining three, led off gallantly on what the Germans have called a "death ride." To make matters worse, the British battle cruisers which had been working round on the outer arc of the circle, so to speak, were now coming into action again. So the enemy's 1st Scouting Group became the centre of a perfect hurricane of fire. The "Derfflinger" had two turrets shattered to bits and was being hit again and again, the "Seydlitz," "Moltke" and "Von der Tann" were also suffering severely when the welcome signal came permitting them to withdraw. By 7:20 the German Battle Fleet had repeated its former tactics and was retreating pell-mell to the westward behind a dense smoke screen put up by its destroyers. The latter pressed on to attack with more determination this time. There was no other enemy in sight so Jellicoe was free to concentrate his attention on this one. A heavy fire was opened on the oncoming torpedo craft which made them loose their torpedoes at long range. At 7:21 the British commander-in-chief swung his ships away in two quick successive turns of two points each before the torpedoes could reach the line. The result was that this attack was completely foiled. A second and third attack were countered by Commodore Le Mesurier's 4th Light Cruiser Squadron which, crossing from its station on the disengaged bow, drove furiously at the enemy. One German destroyer, "S.35," was sunk and several badly damaged. Jellicoe was, for the time being, in complete ignorance of what his main enemy was doing, but directly the torpedo attack had spent itself he, at 7:35, swung the fleet back five points to starboard and steered S.by W. (see fig. 4.)

Beatty had by now worked his way round to the starboard bow of the Battle Fleet and was heading southwest. At 7:40 he signalled to the commander-in-chief to say that the enemy was about 10 m. N.W. by W. But the "Lion" was quite out of sight from the fleet flagship, and her own position, as she gave it, was obviously wrong. Jellicoe, however, turned southwest, on the same course as his battle cruisers. At 7:45 Beatty again reported the position of the enemy, this time adding that the latter's course was about southwest. This signal was made to the "Minotaur" by searchlight, passed by her to the "King George V.," who passed it on to the "Iron Duke," where it did not arrive till 7:59. Jellicoe promptly turned the battle fleet west by divisions, and increased to 17 knots to regain touch with the enemy. Hardly had he done so before a wireless message came to hand from Beatty saying: “Submit van of battleships follow battle cruisers. We can then cut off whole of the enemy's battle fleet.” The commander-in-chief at once ordered Adml. Jerram to comply with this request, but, owing to the unavoidable delay in cyphering, transmitting and decyphering the message, the “Lion” had by then lost sight of the enemy; moreover, the battle cruisers were not in sight from the “King George V.” In point of fact, the battle fleet was already steering straight for the enemy.

Although he had twice butted his head into trouble and twice withdrawn it considerably battered, Scheer was loath to be forced further to the westward and away from home. So, at 7:53, he hauled round and made his way tentatively to the southward. (*see* fig. 4.) Jerram had been somewhat at a loss to carry out his orders, but hearing gunfire on the port bow, he turned his division towards it, and at 8:21 was heading W.S.W. The firing came from Rear-Adml. Napier's 3rd Light Cruiser Squadron, which was engaging the 4th Scouting Group at the head of the High Seas Fleet. After a sharp conflict the enemy turned away and disappeared. Meanwhile, Beatty, who was also steering west, had again sighted the German battle cruisers and beyond them the pre-Dreadnought battleships steering south. He thereupon turned in succession to W.S.W. and opened fire. An attempt by hostile destroyers to attack the British battle cruisers was frustrated by Le Mesurier's light cruiser squadron. Beatty held on his course and was beginning to inflict severe punishment on the sorely stricken enemy battle cruisers; but they could stand no more, and, running out of action to the westward, sought cover behind the old ships of Admiral Mauve's 2nd Battle Squadron.

Meanwhile Jellicoe had good reason to be satisfied with the situation. His battle cruisers had made contact, he was between the German fleet and its own coast, and he seemed on the point of renewing the engagement. At 8:28 he turned by divisions to southwest and stood down on a converging course expecting momentarily to meet his adversary. But Scheer foresaw the impending collision, indeed his headmost ships were already in the track of the on-coming storm. He had no intention of suffering again from its full blast, and by 8:35 he had turned hastily to the westward and disappeared before the British battle fleet came in sight. So the firing died away and now the mists of night rolled down between the rival forces. It was past 9:00 before Jellicoe was fully informed as to the situation; then he received a message from the “Lion” reporting that at 8:40 the enemy's battle cruisers and pre-Dreadnought battleships bore from that ship N. 34° W. 10 to 11 m. and were steering southwest. Beatty at the same time made his position and gave his course also as southwest.

It was now an hour after sunset and growing darker every moment. The hazards of a fleet action at night were unthinkable to a wise commander. It only remained for Jellicoe to maintain his position between the enemy and the German coast until he could fight to a finish the next day. He therefore set about making his dispositions for the dark hours.

IV. EVENTS OF THE NIGHT

There were three potential lines of retreat for the High Seas Fleet. (*see* fig. 1.) The northerly one led to Horn Reefs, and thence down the swept channel inshore of the Amrun Bank minefield to the mouth of the Jade; the second would be reached by a southerly course to a swept channel which led eastward close to Heligoland; lastly, there was the swept channel which led from the vicinity of the Ems river parallel to the coast to the entrance into the Jade. (See fig. 1.)

Jellicoe's Dispositions.—At 9:17 Jellicoe ordered the fleet to take up night cruising stations. This meant that the battle fleet were to close up into three parallel columns with the 5th Battle Squadron, now consisting of three ships only,[1] on the port quarter. Beatty had already anticipated his commander-in- wishes and having taken station ahead and placed the 1 3rd Light Cruiser Squadrons to the southward and westw him, assumed the course and speed of the fleet; these were 17 knots. Five miles astern of the battle fleet Jellicoe mass destroyer flotillas. This had the following advantages:—

(*a*) It covered the rear of the fleet from attacks by hostile fl

(*b*) It increased the chances of intercepting the enemy sho endeavour to make to the eastward, and of obstructing his p by torpedo attacks.

(*c*) It kept the Grand Fleet destroyers clear of their own ships and therefore minimised the chances of disastrous mista the dark.

The value of these dispositions was to some extent dimi by the difficulty of communicating their purport to comma officers, especially those of the innumerable destroyers, b effect, the British fleet ploughing through the night preser living wall of steel barring the enemy's passage home.

Scheer's Return.—Scheer also prepared for the night. H Battle Squadron led the line and was followed by the 3rd Squadron; then came the older ships of the 2nd Battle Squ and lastly the three sorely wounded battle cruisers.[2] The cruisers of the 2nd and 4th Scouting Groups were stationed the head of the battle fleet, while in advance of all were th jority of the German destroyers groping like antennae int darkness. About 9:30 Scheer started to feel his way to the ward, the van of his line turning S.S.E.$\frac{1}{4}$E., a course which he for Horn Reefs. Shortly after 10:00 his advanced light cru came into contact with the right wing of the flotillas bri up the rear of the Grand Fleet. A sharp fight took place in the “Castor,” leading the 11th flotilla, was severely han The near-by destroyers would probably have retaliated more effect had they not been deceived by the enemy ma part of the British challenge for the day. This he appears to picked up through indiscreet flashing signalling between “Lion” and “Princess Royal,” about half an hour previo

The High Seas Fleet recoiled slightly after this brief encou but even the rival forces continued to converge and now Go nough's light cruisers once more came into the forefront o scene. He had been keeping in touch with the “Marlboroug division, but owing to the under-water injuries of the flagship latter was lagging nearly three miles astern of its proper sta The “Castor's” engagement had put the “Southampton” an consorts on the alert, and they were well prepared when, a 10:30, they suddenly found themselves abreast the 4th Scou Group. A fierce contest ensued. The “Southampton” was most vigorously assaulted. Her upper deck became a sham and she was blazing like a haystack from cordite fires, bu the midst of this holocaust she fired a torpedo which sunk “Frauenlob” with all hands. At the end of a quarter of an the enemy had had enough and drew off into the darkness. German light cruisers had already reported the presenc enemy light forces and the order stationing the British destr flotillas astern had been intercepted and translated to Scheer shore wireless station. From these reports he probably real that our battle fleet had drawn ahead. In any case he was termined to force his way to the eastward. At 10:30 he tur back to S.E.$\frac{1}{2}$E. heading direct for Horn Reefs Light Vessel.

The British Destroyers in Action.—The rest of the story of night is one of sudden encounters with an enemy fighting perately to get home while the British destroyers galla threw themselves in his path whenever opportunity served. German fleet was frequently in a state of much confusion, “Elbing” was rammed by the “Posen” and later had to sunk to prevent capture. The “Rostock” was torpedoed the 4th Flotilla and also had to be sunk. On the British side destroyers suffered severely. About 11:30 the “Tipperar was so badly damaged by gunfire that she sank the next morni The “Spitfire” met the great battleship “Nassau” nearly on, tore twenty feet from the latter's plating and carried it

---

[1] The “Warspite” after her involuntary circle at 6:20 P.M. continued to have trouble with her steering gear. At 7:00 she withdrew from the action and at 8:50 was ordered back to Rosyth. She had been badly hit in the earlier fighting.

[2] The “Lützow” was limping along to the northward sink deeper and deeper by the bows. At 2 A.M. she had to be abando and was afterwards sunk with a torpedo.

forecastle. She was badly damaged but had done good
ion with her small gun armament, putting out the big
searchlights and causing a number of casualties.
shock of this conflict again caused the German fleet to
and the leading battleships turned away nearly eight
to the westward, but Scheer was adamant in his deter-
ion to break through at all costs while darkness gave hope
ape. He forced his van back, and by 11:34 the " West-
" was again leading the line to the south-eastward. In
er encounter a few moments later the " Broke's " steering
was disabled and she and the " Contest " rammed the
rrowhawk," and the latter had to be sunk the next day.
een midnight and 12:30 A.M. the " Fortune " and " Ardent "
sunk and the " Porpoise " disabled by gunfire, and the
bulent " was rammed and sunk with all hands. Again
gain the British light craft attacked, but from now on-
the enemy held his course; and the tragedy of that night
hat no accurate information of the German battle fleet was
isafed to Adm. Jellicoe.
miralty Messages.—Two reports, based on intercepted wire-
nessages, were sent to Jellicoe by the Admiralty. One,
tched at 9:58, received in the " Iron Duke " about 10:23,
not decyphered and read until 11, gave an obviously
position of the rear ships of the enemy battle fleet at
A second message, despatched at 10:41, received at 11:05,
read about 11:30, stated that the German battle fleet had
ordered home at 9:14, battle cruisers in rear, course S.S.E.
16 knots. This latter was a summary of several intercepted
ls but most unfortunately it omitted the fact that Scheer,
06, had made an urgent call for airship reconnaissance off
Reefs at daylight, clearly indicating his intended line of
at. The second Admiralty message referred to the enemy's
ments at 9:14, but at 11:38 Goodenough's report was re-
d[1] saying: " Have engaged enemy cruisers at 10:15 bearing
W.," and about the same time the " Birmingham " also
ted from astern: " Battle cruisers probably hostile in sight
least course south " (11:30). These reports came from
which had actually sighted the enemy long after the time
red to in the Admiralty messages. They indicated that he
not yet turned home. The " Birmingham," unfortunately,
ed the German heavy ships at a moment when they had
ed away from our torpedo attacks, his report therefore
misleading, but other ships might have saved the situ-
1.
11:35 the " Valiant," last ship but one of the 5th Battle
dron, noted what appeared to be " two German cruisers
at least two funnels and a crane amidships, apparently
ing to the eastward at a high speed."[2] These details make
rtain that the ships were battleships and should have been
gnised as such. The " Malaya," the last ship of the squad-
had a clearer view and noted at 11:40 " enemy big ships,
e points abaft the starboard beam, steering the same way as
." By the flash of an explosion the leading ship was seen to
" two masts, two funnels and a conspicuous crane (appar-
y " Westfalen " class)."[3] It was obvious that the enemy's
n fleet had closed in from the westward and was edging its
across the wake of the 5th Battle Squadron, yet for some
nceivable reason these two ships neglected to report what
had seen. Had they done so it would have greatly increased
chances of an overwhelming victory next day. The courage
self-sacrifices of the British destroyers did not provide the
thing lacking, *i.e.*, information. Before the curtain of
kness had lifted, Scheer had hacked his way through the light
es and passed to the eastward.
cheer was not yet out of the wood, however. About 1:45,
as a faint grey light was heralding the approaching dawn,
ot. Stirling, in the " Faulkner " with his fine 34 knot 12th
tilla, sighted large ships on his starboard bow, steering a southeasterly course. Even as he manoeuvred to attack he thought to send a wireless report to his commander-in-chief. The attack, carried out with the greatest dash and gallantry, resulted in the battleship " Pommern " being sunk without a trace. Again Capt. Stirling made his wireless message, but neither of his reports reached the " Iron Duke." About 2:25 in the growing light, the " Champion " with three destroyers sighted the enemy. One of the latter, the " Moresby," broke off at once and made a plucky attack which sank the German destroyer " V4," but the " Champion " turned to the eastward and made no report.

At 2:39 A.M. Jellicoe turned north. He had been left with the impression that the enemy had been following him south and now, with daylight rapidly returning, he was anxious to get in touch with a view to renewing the engagement. It had been his intention to close Horn Reefs at dawn, but the night fighting had scattered his flotillas and he deemed it imprudent to thrust into enemy waters until he could collect a destroyer screen. A signal from the Admiralty, despatched at 1:48 A.M. but not received in the " Iron Duke " until 2:40 informed the commander-in-chief that enemy submarines were apparently coming out from German ports. The battle fleet formed single line on the northerly course so as to be ready for emergency in the early morning haze, and so, retracing his path, Jellicoe expected momentarily to fall in with his destroyer flotillas and possibly the damaged " Lützow." Tyrwhitt's Harwich Force had, at last, been ordered to sea, and by 3:50 A.M. he was under way, much too late to be of service. From 3:15 A.M. Zeppelins began to be sighted and at 3:42 A.M. the battle fleet had turned expectantly towards the sound of guns, but found that it was only some British cruisers engaging one of the enemy airships. It was obvious, however, that by now the position of the British fleet must be known to the German command. The hope of meeting the enemy which had been growing fainter was finally shattered by an Admiralty message received at 4:15 A.M. saying that at 2:30 A.M. the High Seas Fleet was only 16 m. from Horn Reefs steering S.E.b.S. at 16 knots.

Beatty was still clinging to the idea that the enemy was to the south-westward, and asked permission to sweep in that direction; but at 4:30 A.M., having re-formed into cruising formation, Jellicoe regretfully made the signal " Enemy fleet has returned to harbour." Scheer reached Horn Reefs Light Vessel about 3 A.M. There he lingered for a short space receiving reports from his airships and taking stock of the condition of his fleet. At 3:30 A.M. he was informed that the " Lützow " had had to be sunk. The rest of the 1st Scouting Group was in no condition for serious action, the battleships which had been in the van had also suffered considerably, and he had only three light cruisers serviceable; moreover the visibility was such that he could not rely on airship reconnaissance. Indeed many of the reports which he received from this source have since been proved to be very inaccurate. A policy of discretion was obviously dictated, and he gave the order for the whole fleet to return to harbour. On the way in, the battleship " Ostfriesland " struck a mine laid in the channel by the British destroyer " Abdiel " but got home.

The losses may be summarised as follows:—

Ships	British	German
Battleships	Nil	1
Battle Cruisers	3	1
Cruisers	3	Nil
Light Cruisers	Nil	4
Torpedo Craft	8	5

Personnel	British	German
Officers (killed)	328	160
Men (killed)	5,769	2,385
Officers (Prisoners)	10	Nil
Men (Prisoners)	167	Nil
	6,274	2,545

The delay was due to " Southampton's " wireless gear having
n shot away.
" Valiant's " report in Jutland despatches, p. 211.
" Malaya's " report in Jutland despatches, p. 220.

On the face of them these figures would appear to leave the balance of Jutland in favour of Germany, so far as destruction of men and ships is concerned, but the value of the battle must be measured in its after effects and not in its momentary losses. There Britain was the gainer.

Results.—The broad effects of Jutland are a matter of history, but they may be summarised as follows:—

1. The High Seas Fleet after "consistently refusing action and manoeuvring with the sole object of returning safely to its base," as Jellicoe has put it, left the Grand Fleet in undisputed possession of the arena.

2. Although the German High Command must have realised that the Grand Fleet as a "fleet in being" was the fulcrum of the whole Allied cause, the High Seas Fleet only once left the Heligoland Bight after Jutland; this was on Aug. 19 of the same year. On this occasion Scheer was warned by airship reconnaissance that the British Battle Fleet was advancing to meet him, whereupon he returned to his base.

3. In Nov. 1918 Scheer ordered the High Seas Fleet to se
break the blockade." It was to have been a final bid for victor
inaction had only served to crystallise the memories of Jutlan
crews refused to weigh anchor. This mutinous outbreak a
helmshaven widened the fissure which shortly afterwards en
the whole German cause.

4. The full fruits of Jellicoe's domination of the German F
Jutland were yielded on Nov. 21 1918, when Beatty receive
surrender of the greater part of the High Seas Fleet.

JUVENILE COURTS: *see* CHILDREN'S COURTS.

AISER, GEORG (1878–), German dramatist, was born at Magdeburg Nov. 25 1878, the son of a merchant. Educated in his native city, he became a merchant and joined the staff of the Deutsch-Ueberseeischen Elektrizi- Gesellschaft, Buenos Aires. After three years he was forced turn to Germany owing to ill-health. He lived for some at Magdeburg and at the Seeheim (Mariners' Home) in n. In 1903 he published his first drama and from that time rds wrote numerous farces, and plays dealing with social ethical problems. In 1920 he was prosecuted for embezzle- and sentenced to a term of imprisonment. His work cted considerable attention both in his own country and d. His play *Von Morgen bis Mitternachts* was produced nglish as *From Morn to Midnight* at the Regent Theatre, lon, in 1926.

s works include: *Die jüdische Witwe* (1911); *König Hahnrei*); *Die Bürger von Calais* (1914); *Von Morgen bis Mitternachts*); *Die Sorina* (1917); *Die Versuchung* (1917); *Gas* (1918 and); *Die Koralle* (1918); *Die Flucht nach Venedig* (1923); *Kolpor-* (1924).

LA-AZAR (*see* 15.637).—In 1881 a malaria-like fever, with enlargement of the spleen, was found to be causing serious ality at the foot of the Garo Hills in Assam, from whence it ad slowly eastward during the next two decades over some m. of the Brahmaputra valley, carrying off about one-third ne inhabitants.

usation and History of Parasite.—It was attributed by essive investigators to hookworm disease, epidemic malaria, Malta fever respectively, until in 1903 Leishman and ovan independently discovered its cause in a new minute ozoal parasite, Leishmania donovani, found in the spleen. he following year L. Rogers developed a flagellate stage ne organism in cultures, and suggested a biting insect, prob- the bedbug, as its carrier, a supposition which was sup- ed by Patton demonstrating the flagellate stage of the site in bedbugs fed on the blood of kala-azar patients in . But in 1925 Knowles and Napier, of the Calcutta School ropical Medicine, appear to have solved the difficult prob- by incriminating a sand fly, Phlebotomus argentipes, as the agent in transmitting the disease; this minute insect, to- er with kala-azar cases, being far more prevalent in areas alcutta with much vegetation than in the more crowded an quarter. After the discovery of the causative parasite 903 it was soon found that what had for a century been called arial cachexia in Bengal was nothing but a widely distributed adic form of the Assam epidemic kala-azar, the virulence of latter being due to its invasion of an area previously free n the disease. The disease is now recognised as being very valent over all Bengal, Bihar, the eastern part of the United vinces and in Madras, but the comparatively dry Punjab north-west frontier are practically free from the disease, a ain degree of humidity being necessary for it. A form of a-azar especially affecting children is also prevalent all round Mediterranean basin and in Egypt and the Soudan.

ymptoms.—Kala-azar is characterised by very prolonged er, often typhoid-like in the early stages, and frequently show- two or three rises and falls in 24 hours, the characteristic ble remittent fever, but with long intervals of low continued ntermittent fever, the total duration being seldom less than en months and often extending, with periods of freedom n fever, over several years; accompanied by extreme wasting, y great enlargement of the spleen, and later of the liver, some emia and extreme reduction of the white corpuscles of the od, which lowers the resisting power of the patients to secon- y infections with septic diseases, pneumonia, dysentery and hisis, which are far more frequently the ultimate cause of th than the original disease, the case mortality having been il recently from 80 to 96%.

Prophylaxis and Treatment.—As the result of his Assam researches of 1897, L. Rogers established a house and site infection of kala-azar and worked out a system of moving the sites of the villages and tea garden coolie lines, whereby the further progress of the epidemic up the Assam valley was checked for many years. J. Dodds Price successfully applied the same plan to stamping out the disease from a number of badly infected tea estates, thereby saving the industry in the Nowgong district. The debilitating effects of the 1918 influenza pandemic led to a recrudescence of kala-azar in the Assam valley, including the more eastern and little infected area. Fortunately by this time an effective treatment had been discovered in intravenous injection of tartar emetic and other antimony preparations, which now enables some 90% of the cases to be cured; a greater saving of life perhaps than has been effected in any such fatal illness by modern medical research, with the result that many thousand cases have been treated successfully each year in Assam and Bengal. Given adequate funds and organisation, this, the most terrible of tropical fevers, might be nearly stamped out of the large areas which it has decimated for centuries past and further epidemics prevented. See L. E. Napier and E. Muir, *Kala-Azar* (1923). (L. Ro.)

KAMERUN: *see* CAMEROONS.

KANSAS (*see* 15.654).—The population of Kansas on July 1 1925, according to the State census of that date, was 1,812,936, as compared with 1,769,257 by the Federal census of 1920. The estimated population on July 1 1926 was 1,820,296. Four cities (Kansas City, Wichita, Topeka and Hutchinson) had over 25,000 inhabitants in June 1926. 43.5% of the population lived in cities and towns of over 1,000 inhabitants. In the ten years from 1915 to 1925 the rural population increased only 5,000 while the urban population increased 135,000.

Agriculture.—Kansas is pre-eminently an agricultural state. It is the largest producer of wheat and corn taken together in the Union. The wheat crop in 1924 was 151,690,970 bu., and the corn crop was 118,789,236 bushels. The crops next in importance were oats and barley. There is an extensive livestock industry.

Mineral Products.—There are considerable deposits of bituminous coal along the eastern border of the state; production amounted in 1924 to about 4,150,000 short tons. Natural gas yielded 27·8 billion cu. ft. in 1920. There has been little effective control of the distribution of gas, and distributing companies have fixed rates in total disregard of their original contracts. The most striking development of the decade in this field had been in the production of petroleum which stood at only 3,000,000 barrels in 1914, jumped to 36,500,000 in 1917, reached the peak at 45,500,000 in 1918 and stood at 28,483,000 in 1924. The supply of materials for cement seems inexhaustible and the value of this product is exceeded only by those of oil, coal and gas. Kansas ranks fourth in the Union in the production of salt, of which the production in 1924 was reported by the State Geological Survey at 794,303 short tons, valued at $3,176,000. The Joplin zinc and lead field overlaps the southeast corner of the State, but while the field approaches exhaustion on the Missouri side, it is capable of indefinite development in Kansas. The output of zinc in 1924 was 105,392 short tons, valued at $13,700,960.

Manufactures and Transport.—Federal statistics distinguish 36 industrial groups in each of which the value of the annual output exceeds $300,000. The larger interests are based upon products of agriculture. The largest is the slaughtering and packing of meat, which in 1923 produced products valued at $224,661,483 —almost one-tenth of the total output of the United States. Nearly the whole of this industry is localised in Kansas City. The next largest industry is the milling of flour, which is widely distributed over the State. Slaughtering and milling together contribute considerably more than half the value of the manufactured products of the State. Railways and the industries subsidiary to them employ a large part of the labour of the State.

The railway mileage was 9,384 in 1923. The electric interurban railway mileage was 582 in 1923. With the building of hard-surfaced roads motor-bus lines are superseding electric railways.

Constitution.—Kansas in 1925 was still governed by her original constitution, adopted in 1859. Twenty-one amendments were made prior to 1910 and seven have been added since that time. The suffrage was extended to women in 1912, and under pressure of the World War the suffrage was limited in 1918 to citizens of the United States. Provision was made for recall of public officers in 1914, but the Supreme Court decided that the clauses are not self-executing, in that they make no provision for special elections, and the Legislature has not seen fit to give them effect. The constitutional requirement that all property be taxed at a uniform rate has delayed tax reform. An amendment permitting the classification of property for purposes of taxation was rejected by the people in 1914 and 1920 but finally carried in somewhat altered form in 1923. Two amendments were adopted in 1920. One, resulting from the efforts of Gov. Allen to reduce farm tenantry, authorised the creation of a fund to assist in the purchase of farm homes. The other so far removed the prohibition of State action in works of internal improvement as to allow the State to assist counties in building roads. No action has been taken by the Legislature under either head.

Legislation.—Generally speaking, legislation has followed the drift in other states. An exception was the " blue sky " law, for the regulation of investment companies, passed in 1911 and amended in detail in 1913 and 1915. It prohibits the sale in the State of stocks not approved by a board, consisting of the Secretary of State, the Attorney-General and the State Bank Commissioner, and thus prevents the floating of worthless securities. It has been extensively copied in other states. Another step in advance was the act of 1913 which provides for the nomination and election of judges by separate ballots without party designation. Since 1910 the administration of the State has become centralised to a high degree. The first step was taken in 1913 in reference to the various educational institutions, and in 1925 all the higher educational institutions were put under the control of a single board called a Board of Regents, consisting of nine members appointed by the governor for terms of four years and electing their own chairman. A provision that part of the board retire annually is intended to give it permanence and remove it from political control. An attempt, made by Gov. Capper in 1917 and renewed by Gov. Allen in 1921, to consolidate on a similar plan the various bureaux that compose the State Board of Agriculture did not succeed. In 1911 the State Board of Railroad Commissioners was superseded by a Public Utilities Commission, modelled on the commissions already established in New York and Wisconsin, to which was given supervision of all public utilities in the State.

The Eighteenth (Prohibition) Federal Amendment was ratified Jan. 14 1919. In 1919 a general strike in the coal-fields broke out, which suspended production and threatened a coal famine in the midst of an exceptionally severe winter. Gov. Allen took over the coal-mines and began their operation by means of volunteers recruited chiefly from among the students in the educational institutions, and called the Legislature in special session to provide against the recurrence of such conditions. The result was the passage in 1920 of an act which created a Court of Industrial Relations, consisting of three members. The act declared the manufacture of food and clothing, the mining of fuel and transport to be essential industries and " affected with a public interest " to such a degree as to justify public control. The right of collective bargaining was recognised but strikes were prohibited and the court was given authority, either on its own initiative or on complaint, to investigate and to issue orders regulating limitation of production, hours and conditions of labour, and rate of wages. Originally the Public Utilities Commission was merged in the Industrial Court, but in 1921 the former was re-established—a separate body and the Labour Bureau and the Industrial Commission were merged in the latter. Finally in 1924 the Tax Commission, the Public Utilities Commission and Court of Industrial Relations, including the Department of Labour, were consolidated in a single board of five
bers called the Public Service Commission. The power
court to fix wages has been annulled by the courts but in
respects it functions satisfactorily operating with the Bure
Labour as a department of the Public Service Commissio
considerable number of cities have abandoned the old city co
form of government. An act passed in 1907 and amend
1909 and 1913 authorised the adoption of a commission
of government in cities of the first and second class. Up to
54 cities reorganised under this law. In 1917 the Legisl
authorised the city-manager plan. All cities that have reo
ised since then (14 by 1925) have adopted this plan.

History.—Kansas has been overwhelmingly Republica
politics and there has been practically no Democratic press i
State. The following have been governors since 1909: W
Stubbs, Rep., 1909 and 1911. G. M. Hodges, Dem., 1912
Capper, Rep., 1914 and 1916. H. J. Allen, Rep., 1918 and
J. Davis, Dem., 1922. S. Paulen, Rep., 1924.

BIBLIOGRAPHY.—Session laws and Senate and House journal
issued after each legislative session. The last edition of the
piled Statutes was issued in 1923. Reports of executive departn
are brought together in a collective volume entitled *Combined*
partment Reports. Other important publications are the *Bie*
Reports of the State Board of Agriculture and the State Boa
Health and the collections of the State Historical Society.
State Library issued in 1920 a reprint of the *Proceedings of the*
stitutional Convention of 1859, with much supplementary histo
matter, edited by H. G. Larimer. (F. H. H.

KANSAS CITY, Kan., U.S.A. (*see* 15.660), annexed about
acres of territory between 1910 and 1920 and over 2,000
including Rosedale, in the following years. Its area is now (
23 square miles. The population in 1920 was 101,177 (104.9
to 100 females), of whom 14,405 were negroes and 11,721 for
born; in 1925 the state census gave it as 116,053. The
packing industry, in which the city ranked next to Chicago,
tinued to overshadow all other industries, contributing 75–
of the total value of factory products within the city li
which totalled $164,081,000 in 1909, $468,686,000 in
$235,561,733 in 1921 and $262,446,752 in 1923. The pac
industry and the livestock market illustrate the economic u
of the two Kansas Cities. The packing houses are on the Ka
side; the state line runs through the stockyards, of which
are in Kansas; the livestock exchange is in the Missouri
By 1925 over $7,000,000 had been invested in the water,
and power plant; the park area had been increased to 300 a
the connecting boulevards to 25 m. and plans for 50 m. more
been made by the city planning commission. A zoning o
nance was adopted in 1924. A city hall was erected in 191
memorial building, dedicated to those who lost their live
the wars of the country, in 1925; and a beautiful county c
house was under construction in 1926.

KANSAS CITY, Mo., U.S.A. (*see* 15.661), the ninetee
city in point of size, and the seat of a Federal Reserve Ba
was in 1924, with its contiguous neighbour across the state
the largest market in the country for hay, stock and feed ca
and stock hogs. It ranked first in distribution of lumber, se
kaffir corn and agricultural implements; second in meat-pack
and as a live-stock and horse and mule market; third in manu
ture of flour and soap and as a grain market; fifth in capacit
grain elevators; sixth in post-office receipts; and tenth in b
clearings.

The population in 1920 was 324,410, of whom 30,719
negroes and 27,320 foreign born; in 1925, according to
official estimate, it was 367,481. In 1924 the output of
manufacturing plants of Greater Kansas City was valued
$604,526,719; the goods distributed by the wholesale house
$727,327,171. Manufacturing was increased after the Wo
War by the establishment of branch plants of many east
firms. The making of open-hearth steel for local consumpt
developed. Large oil refineries were built, with direct pipe-li
from the producing fields. Transportation facilities were
creased by auto-bus lines over hard-surfaced roads built in ev
direction; and by the Kansas City Terminal Railway, wh

rates a system of depressed tracks, constructed at a cost of ,000,000, and a Union passenger station opened in 1914.

y 1925 the public school system included 90 elementary ools, five senior and three junior high schools, a teachers' ege, a junior college, 31 combination and special schools; ond issue of $5,000,000 for new buildings and equipment had been authorised. The common "chest" for 45 philanpic agencies was nearly $1,000,000; a city plan had been pted (1922); there were 3,470 ac. in the parks and playınds, 95 m. of continuous boulevard, an exceptionally fine ball park and 10 golf courses; a comprehensive zoning nance had been passed (1923); a new water supply plant to $11,000,000 was under construction; the Liberty Memorial, gned as the central feature of a group of buildings for cultural poses, was nearing completion opposite the Union Station a. The cost of living in Kansas City is relatively low (94·4% he average for 31 American cities, Dec. 1924). In 1925 w charter—the fourth prepared within eight years, and the d submitted to the voters—was adopted by a large majority, ing up the council-manager form of government.

APOK: *see* CELLULOSE; FIBRES.

APP, WOLFGANG (1868–1922), German politician, was born ew York July 24 1868. He was the son of Friedrich Kapp, ational Liberal member of the Reichstag in Bismarck's time, grew up under the Bismarckian influences. Having held ous minor official posts, he founded the agricultural credit itute in East Prussia, which achieved great success in proing the prosperity of landowners and farmers. He was conıently in close touch with the Junkers of East Prussia and ing the World War made himself their mouthpiece in an ck on Bethmann Hollweg (*Die Nationalen Kreise und der chskanzler* (1916). He was also one of the founders of the aterslandspartei." For a brief period in 1918 he was a Conative member of the Reichstag.

app remained in the background till March 12 1920, when Republican Govt. suddenly issued an order for his arrest. ecame known that he had organised, with General von Lütt and other officers, a conspiracy to occupy the Government es, and assume power in Berlin. This he actually succeeded oing on the morning of March 13. Kapp was installed in the erial Chancellary and at once styled himself "Chancellor of Reich." President Ebert and most of his ministers fled, to Dresden and then to Stuttgart. The Kapp Govt. was, ever, short-lived. The working classes of Berlin rendered its tinuance impossible by declaring a universal strike, and on evening of March 17, Kapp and Lüttwitz fled to Berlin. Wars were issued for their arrest, but Lüttwitz disappeared comely, and Kapp eventually escaped by aeroplane to Sweden. April 1922 he returned to Germany and was immediately sted for high treason, but he died on June 12 from the consences of an eye operation at Leipzig, before the case was heard.

ARACHI, India (*see* 15.672), has grown very rapidly, and the ulation, which was 216,883, half Hindu and half Moslem, in 1, has nearly doubled since 1901. In 1920–1, 364 plans for buildings were approved, and 367 in 1921–2. Among note public buildings are the municipal offices, begun before the rld War but unfinished in 1923; the fine Port Trust offices customs house (1915); a small causes court, revenue office paper currency office; the Jehangir Kothari hall; a home for r and defective persons, a new maternity home, and a Wel Association building; a masonic temple, a commercial ege and several schools. The foundation stone of a new ding for the chamber of commerce was laid in 1924. A parade h terraces and a pier to the water's edge was opened at New ton in 1921, and a People's Park has been laid out in the old of the river Lyari. A new embankment road skirts the old n and forms the southern boundary of the park. A contract placed in 1925 for a new conduit from Malir, 16 m. long, to ease the supply.

arachi is a progressive port with a great future. It receives produce of the Punjab, Sind, Baluchistan, Afghanistan, ch of Rajputana, and part of the United Provinces, while the Delhi trade has shown a tendency to pass through Karachi rather than Bombay. The great Sukhur barrage scheme, which received official approval in 1921, will bring the exportable produce of a further 3,500,000 acres to the port. Trade has recovered gradually from the effects of the War, and the exports are largely wheat. The imports are mostly cotton and woollen goods and yarn. A new boat basin was built in 1911, a wharf for coasting steamers in 1912 and work on other extensions is in progress. It is planned to build 13 new berths on the west side of the harbour. Land for six berths was reclaimed in 1923–4, and it is hoped that three berths, each 550 ft. long, will be finished by 1927. The North-Western Railway, on which Karachi is dependent, is now double-tracked as far north as Samasata.

KARNEBEEK, HERMAN ADRIAAN VAN (1874–), Dutch statesman, was Netherland's delegate to the Second Peace Conference at The Hague in 1907. In 1911 he became burgomaster of The Hague, holding this position until 1918, when he was appointed Foreign Secretary. In 1921 he presided at the second Assembly of the League of Nations.

KÁROLYI, MICHAEL, Count (1875–), Hungarian politician, born on March 4 1875, and descended from a famous and wealthy family, Count Károlyi, after a delicate childhood, took his degree at Budapest University, exhibited keen interest in horse breeding and horse racing and became, in succession to his uncle, president of the Hungarian Co-operative Society (Hangya). He then travelled a good deal, spending much time in Paris. In 1902 he stood for Parliament as a Liberal but was defeated. In 1905 he was elected to a short Parliament and took no further part in Hungarian public life until 1909 when he became president of the Hungarian Agricultural Society, and worked for the creation of an agrarian Centre party. He then resigned from the conservative Agricultural Society and, having come under the influence of the writings of Karl Marx, became leader of the Radical wing of the Independence party, and led the Parliamentary opposition against Count Stephen Tisza, then Prime Minister, with whom he fought a duel.

Opponents of Count Károlyi have maintained that his jealousy of Tisza and his enmity against the older statesman were the dominating motives of his career. Count Károlyi, in his autobiography, *Fighting the World*, while admitting that it was Tisza who drove him into a democratic camp, has maintained that his political ambitions were to break the relations between Austria and Hungary, substituting for them a Russo-Hungarian *rapprochement*, and also to destroy the capitalist system. In order to provide party funds for these purposes he entered into secret negotiations with the French Govt. and visited America. His return from that country coincided with the outbreak of the World War and he was interned in France, but was soon released on the understanding that on reaching Hungary he would do his best to bring the War to a speedy conclusion. He then seceded from the Independence group and founded the Károlyi party for the purpose of breaking with the Germans and entering into a separate treaty of peace. In spite of these opinions he married, on Nov. 7 1914, the step-daughter of Count Julius Andrássy, a statesman with utterly opposite views, and became an officer in the National Defence Hussars. He concentrated his activities throughout the War on pacific aims in the hope that their realisation would achieve in Hungary the enactment of universal suffrage, socialisation of industry and the division of land amongst the people.

On Oct. 25 1918, when the War was clearly lost, Count Károlyi founded the National Council composed of his own personal supporters, Social Democrats and Radicals. The Werkerle Cabinet resigned, and Count Hadik was appointed Premier by King Charles. On Oct. 30 there was a revolution, led by the Soldiers' Council and supporters of the National Council, who occupied practically all strategic points in Budapest. The next day Count Hadik resigned and in the name of King Charles Archduke Joseph had no alternative but to appoint Count Károlyi as Prime Minister, who then took the oath of allegiance to the King. The same day, Oct. 31 1918, Count Tisza was assassinated in his Budapest home by revolutionaries. On Nov.

16 the Hungarian People's Republic was proclaimed at a public meeting under the auspices of the National Council, and full powers were entrusted to the Cabinet of which Károlyi was Prime Minister. On Jan. 11 1919 the National Council formally proclaimed Károlyi as President of the People's Republic.

It was a short-lived triumph. The forces of disruption and discontent soon got completely out of hand and on March 21 1919 Count Károlyi handed over the Government to the Soviet of Bela Kun. Count Károlyi remained in the country unmolested until the eve of the collapse of terrorism and then left Hungary for Czechoslovakia. Later he was expelled from Italy for Communist propaganda and made his headquarters in Paris, visiting the United States, where he was prohibited by the Government from continuing propaganda presumably against the Hungarian Govt., which might have affected the League of Nations' loan for Hungarian reconstruction.

The High Court of Hungary found, after public trial at which Count Károlyi was legally represented, that on account of his actions during the War and in organising the revolution he was guilty of high treason and felony. As a result of that verdict Count Károlyi's estates were confiscated, a large portion of them being divided under Land Reform, among some 5,000 smallholders. Other accusations made against Count Károlyi by his fellow-countrymen were that by his systematic encouragement of mob-law and military indiscipline and by his weakness as Prime Minister and President he was the direct cause of the Bolshevist reign of terror and the subsequent occupation of Hungary by the Rumanian Army. It is further officially maintained that by negotiating a separate armistice with Gen. Franchet d'Esperey at Belgrade Károlyi deprived Hungary of many territorial and other rights to which she was entitled under an armistice previously concluded by Gen. Diaz on the Italian front with the Austro-Hungarian armies. (W. Go.*)

KATA THERMOMETER.—In considering measurement of ventilation we must bear in mind that the ordinary thermometer merely gives the average temperature of its surroundings. While the human body produces heat, and all day long is keeping itself at body temperature, the thermometer does not produce heat, but just registers the effect of the surrounding atmosphere upon itself. An instrument is needed, then, to indicate the cooling and evaporating power of the air.

The Kata thermometer is such and is far more indicative of human feeling than the ordinary thermometer. It records not only the effect of the temperature of the surrounding air on the cooling of its surface when at body temperature, but of the wind and any movement of the air, and also how quickly cooling takes place when its surface is wet, as the skin is when perspiration is going on. The Kata thermometer is a large-bulbed alcohol thermometer of standard size with stem graduated from 100° to 95° Fahrenheit. It is warmed up in hot water till the meniscus rises above 100° F.; the bulb is then dried, and the rate of cooling of the meniscus from 100° to 95° F. taken with a stop-watch. From a factor number determined for each instrument the cooling power is deduced in millicalories (1/1000 gramme calorie) per sq. cm. of the surface of the bulb at body temperature per second. In still air the dry Kata thermometer has a cooling power of about 10 at 0° C., and about 5 at 20° C.; with a wind of 9 m. per hour it has a cooling power of about 40 at 0° C., and 20 at about 15° or 16° C., and so on with different rates of wind. Wind is far more important than temperature to the cooling of the body; thus the still air is easily borne. In the case of the wet Kata thermometer a wet muslin glove covers the bulb. In factories, schools, etc., the reading of the cooling power of the dry Kata thermometer should not be less than 5–6 with a temperature of about 60° F., 7 at 70 and 8 at 80°, otherwise the efficiency of the worker and pupil will tend to go down. Observations made by the Industrial Fatigue Board in pottery, boot and shoe, cotton and printing works, showed that a great number of readings were below 6. The general mortality is greater in the trades with the lower readings. Great improvements could yet be made in this respect. See Medical Research Council, *Special Report, No.* 73 (1923). (L. E. H.)

KATO, TAKA-AKIRA, COUNT (1859–1926), Japanese sta man (*see* 15.696), resigned his post as ambassador in London Dec. 1913, having in the previous year been created a bar Returning to Japan, he joined Prince Katsura's third Cabine foreign minister for the third time but resigned soon after. then reorganised the Doshikai, created by Katsura, and renan it the Kenseikai or Constitutionalist party, of which he beca president in 1913 (*see* JAPAN). In April 1914 he joined the Oku Cabinet as foreign minister, resigning in 1915. It was during incumbency that Japan sent the so-called 21 demands to Chi In Aug. 1915 he was elected a crown member of the house peers and in the following year was created a viscount. T following decade proved a quiet period for Kato, but in 1924 became premier of the Coalition Cabinet of the Kenseikai, Seiyukai and the Kakushin Club. His administration was ma historic by the passage of the universal manhood suffrage la Owing to dissensions among members of the Cabinet, K reorganised his Ministry on Aug. 1 1925, forming it exclusiv with members of the Kenseikai party. On Jan. 28 1926 he d in Tokyo while in office. The Emperor, learning the gravity his illness, conferred upon him the dignity of count.

KATSURA, TARO, PRINCE (1847–1913), Japanese soldier a statesman (*see* 15,697).—In Aug. 1911 he resigned the premi ship in favour of Marquess Saionzi, after completing the work financial reform and treaty revision which he had undertak and received the rank of prince. On Dec. 20 1912 he again cepted office as Premier. In Feb. 1913, however, a vote censure on the Premier was moved in the Diet for the alleg misuse of imperial rescripts, and on Feb. 10 the Prince resign office. His health was already failing, and he died in Tok Oct. 10 1913.

KAVALLA (*see* 15.701).—This port on the coast of easte Macedonia, with an exposed harbour, has a population of ab 20,000. The immediate hinterland is a rich tobacco-growi country, but Kavalla is handicapped by the fact that the railw from Salonika to Dedeagach runs through Drama, 22 m. inla from the coast, with no branch line to Kavalla. Kavalla h belonged to Greece since the Balkan War of 1912–13. It w coveted by Bulgaria as a maritime outlet, and M. Veniselos w inclined to concede it to her, but this policy was ruled out by t outbreak of the second Balkan War. After the outbreak of t World War, when Bulgaria was still neutral, the British Gov attempted to attach Bulgaria to the Allied cause by offering cede Cyprus to Greece, on condition that Greece ceded Kava to Bulgaria. This offer was rejected by King Constantine's Gov Bulgaria intervened on the side of the Central Powers; a Kavalla has remained under Greek sovereignty, though t Bulgarians occupied it during the Salonika campaign. Duri the negotiations over the peace treaty of Neuilly (*q.v.*) wi Bulgaria, M. Veniselos offered to connect Kavalla with the ready existing narrow-gauge railway in the Struma vall which runs from the Bulgarian side of the frontier to Sofia. T would have contributed to the fulfilment of Article 48 of t treaty, in which the principal Allies assured to Bulgaria an e nomic access to the Aegean Sea; but no action has been tak upon the offer of M. Veniselos. See *Handbook of Macedon* (British Admiralty, 1920).

KEANE, JOHN JOSEPH (1839–1918), American Roman Cath lic archbishop (*see* 15.706), died at Dubuque, Ia., June 22 19 He had retired in 1911.

KEITH, SIR ARTHUR (1866–), British anthropologis was born at Old Machar, Aberdeen, Feb. 5 1866. He studie medicine at Aberdeen University; University College, Lond and Leipzig. He lectured extensively on anatomy and surger became a leading authority on anthropology, and an expert on t reconstruction of prehistoric man from fragments or fossil r mains. He was Fullerian professor of comparative anatomy a the Royal Institution from 1917 to 1923, became conserva of the Museum and Hunterian professor at the Royal Colleg of Surgeons in 1908 and acted as honorary secretary of th Royal Institution from 1923. He was secretary and la president of the Anatomical Society of Great Britain, presid

he Royal Anthropological Institute (1913–7), and in 1913
elected F.R.S. and *membre de la Société d'anthropologie de*
is. He was knighted in 1921, and was designated as president
he British Association for 1927. (*See* MAN, EVOLUTION OF.)

is published works include *Introduction to the Study of Anthropoid*
s (1897); *Human Embryology and Morphology*, 4th ed. (1921);
ient Types of Man (1911); *The Human Body* (1912); *Antiquity of*
(1915, 2nd ed. 1925); *Menders of the Maimed* (1919); *Engines*
ie Human Body (1919, 2nd ed. 1925); *Nationality and Race*
9); and *Religion of a Darwinist* (1925).

ELANTAN: *see* MALAY STATES.

ELLER, ALBRECHT (1845–1920), German painter (*see*
18), died in Munich July 13 1920.

ELLERMANN, BERNHARD (1879–), German novelist,
born at Fürth on March 4 1879. In his early books he en-
oured to describe his emotional experiences, *Yester und Li*
4), *Ingeborg* (1906), *Der Tor* (1909), English translation *The*
(1925). As the result of his travels abroad he wrote *Das*
(1910), English translation *The Sea* (1925), an exotic novel,
his Japanese book *Sassa Yo Yassa* (1912), the main part
hich is devoted to a description of Japanese dances. His
l *Der Tunnel*, dealing with the future, chiefly concerns the
ions between Europe and America and caused a great
ation on its appearance in 1913. He wrote articles on the
ld War in his capacity as correspondent, and also produced
books, *Der Krieg im Westen* (1915) and *Der Krieg im*
nnerwald (1916). After a long interval he published in 1920
ovel on the German Revolution, *Der 9. November*, English
slation *The 9th November* (1925), and later still his novel
edenklees Erlebnis (1923). In addition to a further novel, *Die*
igen (1922), he also wrote the drama *Die Wiedertäufer von*
ster (1925).

ELLOGG, CLARA LOUISE (1842–1916), American singer
15·719), died at New Hartford, Conn., May 13 1916. She
the author of *Memoirs of an American Prima Donna* (1913).

ELLOGG, FRANK BILLINGS (1856–), American diplomat
awyer, was born at Potsdam, N.Y., Dec. 22 1856. In 1865
ent with his parents to Minnesota, where he studied law and
admitted to the bar in 1877. He practised in Rochester,
., for 10 years, removing in 1887 to St. Paul. He was re-
d as special counsel for the United States in the actions
st the Paper Trust and the Standard Oil case. He also
ared as special counsel for the Interstate Commerce Com-
on in the investigation of the Harriman railways, and for the
ed States in the action to dissolve the Union Pacific and
hern Pacific railway merger. He was a delegate to the Re-
can National Conventions of 1904, 1908 and 1912, and was
ed U.S. Senator from Minnesota for the term 1917–23.
as also U.S. delegate to the fifth International Conference
merican States at Santiago, Chile, 1923. In 1924 he was
inted ambassador to Great Britain, succeeding G. B. M.
ey. He resigned in Feb. 1925, to accept an appointment as
Secretary of State. In this capacity he took a firm stand in
ort of United States citizens whose property rights in Mexico
threatened by proposed Mexican legislation.

ELLOGG, VERNON LYMAN (1867–), American zoologist,
orn at Emporia, Kan., Dec. 1 1867. He graduated from
University of Kansas, subsequently studying at Cornell
ersity, Leipzig and Paris. He was successively assistant
ssociate professor of entomology at the university of Kan-
890–4, and professor of entomology and lecturer in bionom-
t Stanford University, 1894–1920. Having acted as a
tor, in Brussels, of the American Commission for Relief in
um, 1915, he served as assistant to the U.S. Food Adminis-
r, 1917 and in various capacities with the American Relief
mission in Poland and Russia, 1918–21. He became per-
nt secretary and chairman of the division of educational
ons of the National Research Council, Washington, D.C.,
He wrote *American Insects* (1904); *Evolution and Animal*
with D. S. Jordan (1907); *Darwinism To-day* (1907); *The*
als and Man (1911); *Headquarters Nights* (1917); *Herbert*
er, the Man and His Work (1920); *Nuova, or the New Bee* (1921); *Human Life as the Biologist Sees It* (1922); *Mind and Heredity* (1923); and *Evolution* (1925).

KENDAL, WILLIAM HUNTER (1843–1917), British actor (*see* 15.727), died in London Nov. 7 1917.

KENT, ROCKWELL (1882–), American painter, was born at Tarrytown Heights, N.Y., June 21 1882. His early education was obtained in a boarding school in Connecticut. He studied architecture for a time, but turned to painting, and was a pupil of Robert Henri. Of a roving disposition, he went to sea as ship's carpenter, painting what he saw in his travels, and writing his impressions. His work was quite individual in its character, and attracted great attention by its unique qualities of light and shade. He also produced some book illustrations. His chief paintings in the United States are "Marine" in the Metropolitan Museum, New York City, and "Lone Woman" and "Mother and Child," in the Brooklyn Museum. He wrote two books of travel *Wilderness* and *Voyaging*, and contributed to magazines.

KENTUCKY (*see* 15.740), a State of the United States of America. The population in 1920 was 2,416,630, as compared with 2,289,905 in 1910—an increase of 5·5 per cent. There were 1,227,494 males and 1,189,136 females. The whites numbered 2,180,560, an increase since 1910 of 7·5%; the negroes, 235,938, a decrease of 9·8%; foreign-born whites, 30,780. The density in 1920 was 60·1 to the sq. m.; in 1910, it was 57%. The urban population increased from 24·3% in 1910 to 26·2% in 1920. The estimated population of 1925 was 2,488,423. The population of towns with over 20,000 inhabitants in 1910 and 1920 was as follows:—

	1910	1920
Louisville	223,928	234,891
Covington	53,270	57,121
Lexington	35,099	41,534
Newport	30 309	29,317

Education.—The large number of illiterates reported in 1910 (208,084) led to the creation of two illiteracy commissions in 1914 and 1918 respectively. In Rowan county in 1911 night schools for adult illiterates were inaugurated. A compulsory attendance law, consolidated schools, better organisation, and more revenue, reduced illiteracy from 12·1% in 1910 to 8·4% in 1920. An Act of 1920 granted to counties and cities ample taxing powers to provide for their schools. The census reported 702,391 children of school age, of whom 654,092 were enrolled in 1925. High schools shared in this expansion, increasing from 83 in 1910 to 493 in 1924. New State normal schools were established in 1922 at Morehead and Murray.

Agriculture.—The number of farms increased from 259,185 in 1910 to 270,626 in 1920, but improved land decreased from 14,354,471 acres to 13,975,746 acres, despite the efforts of the reclamation service, which expended $1,620,027 in the counties bordering on the great rivers and in the western coal area. This drainage and flood-prevention work involved 471,874 acres. The number of farm owners increased from 170,332 in 1910 to 179,327 in 1920; the number of tenants decreased in the mining counties and increased in Mason, Boyle, Mercer, Fayette, Bourbon, and Jessamine. The value of farm property rose from $773,797,880 in 1910 to $1,511,901,077 in 1920. The average value of farms in 1910, $2,452, rose to $4,823 in 1920, and the average value of the land from $21.83 per acre to $48.62. Live stock on Jan. 1 1925 included 334,000 horses, 272,000 mules, 536,000 milch cows, 433,000 other cattle, 715,000 sheep and 859,000 swine. The total value of live stock in 1920 was $148,125,506. The total value of farm crops in 1924 was $200,760,000; in 1925, $178,816,000.

Field crops in 1920 were valued at $347,338,888;and in 1924 at $200,760,000. Low tobacco prices in 1913 and 1920 led to demands for co-operative marketing associations, of which the most notable were organised under the Bingham Act of 1922. In general, these efforts were successful, although the dark tobacco "pool" released its members from their contracts in 1925. Tobacco is the chief crop: in 1922 there were 525,000 acres under cultivation yielding 446,290,000 lb. worth $87,019,000 but in 1924 corn (76,200,000 bu.) exceeded in value the tobacco yield.

Minerals.—The output of coal rose from 14,623,319 tons in 1910 to 55,187,000 tons in 1925; to provide for the increased output, most of which was produced in the eastern counties, the Louisville and Nashville Railroad constructed 333 m. of track and expended $30,000,000 during the decade of 1910–20. Because of low prices, petroleum was only marketed in small quantities before 1916. Stimulated by the War demand, prices rose from $2.05 per barrel on Jan. 1 1917 to $4.50 at the close of 1920. The following table shows the production during certain periods:

	No. of barrels produced	Value
1919	9,226,472	$24,459,016
1920	8,949,185	33,556,241
1925	7,064,553	14,129,106

The most productive pool, Big Sinking, was opened in Lee county, and a new field appeared in the south western counties, centering about Allen and Warren. In many locations the drillers opened gas wells which have reduced the State's dependence on West Virginia's supply, and Mt. Sterling, Winchester, Paris, Lexington, Frankfort, and Louisville now obtain natural gas. The principal oil refinery is at Louisville. From 1909 to 1919 the capital invested in mines, quarries and wells rose from 26 to 201 millions, or 651%; the value of products from 12 to 98 millions, or 715%. The value of manufactured products in 1921 was $302,742,000.

Communications.—Steam railway track increased from 3,641 m. in 1910 to 3,956 m. in 1923. There were 493 m. of electric railway track in 1924. Additional pipe-lines for oil were supplemented by river boats, for which locks were built by the United States Government. The state highway commission, set up in 1920, which had an income in 1924 of $11,157,000, controlled 2,360 m. of road in 1925. A new bridge has been erected at High Bridge; and, near by, the Dix river dam, developing 30,000 H.P. of electric current.

Finance.—The old revenue system, based on a general property tax, proved inadequate to meet the cost of progressive legislation. The Assembly in 1917 created a tax commission and classified grouping replaced the old property tax, so that the rate on general property became 50 cents per $100 assessed valuation. There is a graduated inheritance tax. Increased by licence and franchise revenues, the general fund is apportioned to various purposes. Under the new law, bank deposits rose from $11,000,000 in 1916 to $179,000,000 in 1917; assessed values from $922,000,000 in 1917 to $2,184,202,703 in 1925; railway valuations from $160,000,000 in 1917 to $233,372,000 in 1924. The total revenue in 1925 was $25,038,577. On July 1 1926 the bonded debt was $3,959,298. A floating debt, in the form of treasury warrants, sometimes exceeds $10,000,000.

Legislation.—The Acts of the General Assembly contain many provisions in regard to labour, education, and public health. The Child Labour Act of 1908 was improved in 1910, 1912, 1914 and 1916. Other progressive laws cover the subjects of tax reform, prisoners, banking, insurance, vital statistics and sanitation. In general the Assembly has welcomed all offers of Federal co-operation in matters of agricultural extension, road-building, and public health. An Act of 1920 to prevent the sale of worthless securities was due to the speculation in oil shares after 1916. A series of Acts permits all cities to adopt the commission plan.

History.—The increase of prices during the World War brought prosperity to purveyors of coal, petroleum, live stock, food and tobacco, and lured many producers into unwise ventures where they suffered severe losses after 1920. Kentucky felt keenly the advent of national prohibition, inasmuch as her distilling industry in 1914 occupied first place, with an output valued at $48,862,526. Between 1910 and 1925 the Democrats controlled the Assembly and elected three governors: J. B. McCreary (1911–5), A. O. Stanley (1915–9) and W. J. Fields (1923–7). The Republicans in 1919 elected as governor E
Morrow, who had been defeated by only 471 votes in 1
They chose as United States senators, R. P. Ernst in 1920
F. W. Sackett in 1924, in which year, for the first time in
history, Kentucky cast all her electoral votes for the Republ
party. In 1912 the 120th county (McCreary) was organised
of parts of Pulaski, Wayne, and Whitley. In Nov. 1917
United States Supreme Court declared void Louisville's r
segregation ordinance.

cluding Arabs) 26,789, Arabs 10,557, Africans (estima
2,483,500. A census of non-natives taken in 1926 gave the
lowing result: Europeans 12,505; Indians 26,758; Arabs 10,
others 3,821. An unofficial estimate placed the natives at s
2,600,000. The Arabs are people long settled in the coast la
the other Asiatics are mainly British Indians (22,822 in 19
The chief towns are Mombasa and Nairobi (*q.v.*).

I. POLITICAL HISTORY

Kenya presents problems not found in other parts of tro
Africa, where the white population is practically confine
officials, missionaries and traders, inasmuch as it contain
elevated area of about 15,000 sq. m. where climatic condi
have made it possible for a European community to ma
permanent home. Indian population presented another r
factor, and the task of the administration was largely to reco
the claims of the Europeans with those of the Indians, and
claims of both races with the rights and interests of nativ

White settlement in the highlands began in 1904; the ce
of 1911 showed 3,175 Europeans in the country, as ag
11,886 Asiatics. The settlers had the advantage of finding
Uganda railway built. They engaged in stock-raising and g
coffee, maize, wheat, barley, flax and vegetables. In the lowla
sisal, tobacco and coco-nut plantations were started. For ma
labour they were dependent on the natives, and the bulk o

m work was done by the Kikuyu, a tribe with an aptitude for
riculture. Sir Percy Girouard (governor 1909–12) achieved
somewhat difficult task of working harmoniously with the
tlers, whose grievances then were chiefly over the delay in
ting land grants, but who were already beginning to claim a
re in the government. The next year (1913) was most notice-
e for the acute controversy which arose over a missionary con-
ence at Kikuyu, when the Bishop of Mombasa (Dr. W. G. Peel)
ciated at a communion service in a Presbyterian church at
ich Anglicans, Presbyterians, Wesleyans and others com-
nicated. Apart from the theological controversy this service
used, it served to draw attention to the fact that, up to that
iod, by far the greater part of the work not only of Christian-
g but of civilising the natives and giving them industrial as
l as literary education was in the hands of missionaries.

he War Period.—The World War caused a setback in the
nomic conditions of the country. The majority of the white
e settlers went on active service and agriculture and stock-
ing suffered in consequence. Very heavy demands were also
le on the natives, who had to supply carriers, transport oxen
meat to the troops. They responded well to these demands
large numbers of natives joined the combatant ranks. After
War a brief period of revival in trade was followed by a longer
od of depression. Major-General Sir Edward Northey, who
over the governorship on Jan. 31 1919, had to deal with the
culties created by a period of change and strain. The white
lers were restive, the Indians were demanding political rights,
natives were in great need of careful guidance—so that on
one hand they should cultivate their reserves and on the
r hand supply the labour required for public works and the
is and plantations of Europeans. To add to the trials of the
le, white, black and brown, a currency crisis arose through
rise in the exchange value of the rupee—the Indian rupee
g the legal currency. An ill-advised stabilisation of the ru-
at 2s. in Feb. 1920 was quickly followed by the introduction of
inage based on British currency. In May 1921 the shilling
ided into 100 cents) was made the standard coin. These
ency troubles inflicted much hardship on the producing
es. Dissatisfaction arose also over the great difficulties en-
tered in carrying out a scheme launched in 1919 to establish
ldiers from Great Britain on the land. By 1924, however,
settlement was, on the whole, a success. Over 700 farms out
000 granted to ex-combatants were being worked.

ange of Status.—During this period of strain the change
a protectorate to a crown colony was effected (July 1920).
new colony was named after Mount Kenya, the most com-
ding natural feature of the country. The coast lands which
ed part of the Sultanate of Zanzibar were not annexed but
me the Kenya Protectorate. In 1919 a change in the con-
tion had introduced, for Europeans, an elective element in
egislative council, 11 single-member constituencies being
ed, with adult franchise on a residential qualification. At
ame time two members were nominated to represent the
n community. This discrimination against Indians was
erate. Sir Edward Northey, the then Governor, stated in
1919 that "though Indian interests should not be lost sight
uropean interests must be paramount." Prolonged agita-
ollowed. The Indians claimed equal rights with Europeans
common franchise, and they had the strong and unremit-
upport of the Government of India. The white settlers, to
the development of the country's resources was very largely
vehemently contested the claims of the Indians, most of
were clerks, mechanics, shop assistants, small traders and
rers, though they included professional men and merchants
h standing. The whites further alleged that the Indian
nce on the natives was bad.

e whole question came under consideration by the British
, whose decision was given in the Kenya White Paper in
1923. The most significant part of this decision was that—

> interests of the African natives must be paramount, and that
> d when, those interests, and the interests of the immigrant
> [European and Asiatic] should conflict, the former should
> prevail. As in the Uganda Protectorate, so in the Kenya Colony, the principle of trusteeship for the natives, no less than in the mandated territory of Tanganyika, is unassailable.

In respect to the franchise the British Govt. decided on a communal system of representation—that is, separate electoral rolls for Europeans, Indians and Arabs. The 11 seats on the Legislative Council for Europeans were retained; five seats on the council were allotted to the Indians and one seat to the Arab community, all on an elective basis; while one member was nominated specially to represent the natives. By means of other nominated members the Government, however, retained control of the council. The franchise apart, the British Govt. decided against the segregation of Indians in townships, but the practice which had been followed of reserving land in the highlands for Europeans was maintained.

The European community, despite some disappointment, loyally accepted the British Govt's. decision; the Indians continued their agitation—which included a refusal to pay the poll tax—and refused to elect members to the council. In Dec. 1924, however, more moderate counsels prevailed and it was decided to accept seats on the council. This settlement was largely due to the wisdom and courage of Sir Robert Coryndon, who became governor in Sept. 1922, and, while a firm upholder of native rights, fully recognised the work done by the Europeans and the services rendered by the Indians. Sir Robert died at Nairobi on Feb. 10 1925 and was succeeded by Sir Edward Grigg.

In respect to the natives, the policy of the administration was to guide them through their own chiefs and tribal organisations, and gradually to teach them the art of government. These efforts, supported by the missionaries and by many of the white settlers, met with a considerable measure of success. In 1922 they were extended to include, in addition to medical, educational and other services, direct encouragement of stock breeding and agriculture in the native reserves. This lessened the potential supply of labour for the Europeans, some of whom held that the first duty of the native was to work for the white man—though figures showed that the natives working on European farms increased from 53,000 in 1919–20 to 87,000 in 1923–4. Compulsory labour for private persons had been definitely prohibited in 1920. The root of the labour difficulty was that the population was insufficient for the intensive cultivation both of the European farms and the native reserves. In 1925 certain companies obtained permission to import labourers from Portuguese East Africa.

In 1924 a parliamentary commission, of which Mr. Ormsby-Gore was chairman, spent two months in Kenya, one of its main objects being to consider plans for the development of East Africa as a whole. It was followed in Feb. 1926 by a conference at Nairobi of the governors of all the East African territories. The parliamentary commission wrote in terms of high praise of the European settlers, "pioneers in a hurry," who desired to build in the highlands "a distinctive type of British civilisation" while obtaining "a more complete inter-relation and co-operation between the European and the African than exists either in South or West Africa."

II. ECONOMIC CONDITIONS

Under agreements reached in May 1926 the Masai reserves were increased by a portion of the disputed area known as the "Promised Land." The triangular portion of the Yatta plateau, which was to have been included as far as the Wakamba Reserve was omitted, as no natives have occupied it.

Kenya depends almost wholly on agriculture (including stock-raising), and development is largely a matter of increased means of communication. External trade passes through Mombasa (*q.v.*). The railway to that port also carries the produce of Uganda. Since 1917 Kenya and Uganda have formed an administrative unit for customs purposes, and there is complete freedom of trade between the two territories. The figures of trade therefore represent the total of both territories. On analysis it is shown that Kenya takes the bulk of the imports and Uganda supplies more than half the exports. The value of commercial imports into Kenya in 1913–4 was £2,147,000, the value of exports £1,482,000. For 1924, a normal year, the value of imports for consumption in Kenya was £4,038,000, while the domestic exports of Kenya were valued at £2,239,000. The chief exports from Kenya were coffee, maize, hides and skins (the last chiefly from native reserves). Kenya coffee is of high quality and is much favoured on the London market. It was not until 1922 that serious efforts were made to cultivate cotton, and the area in Kenya suitable for cotton is not very large. Up to 1925 the output was small but prospects were encouraging. The main mineral export is carbonate of soda from the Magadi lake.

Communications.—The transport system of Kenya and Uganda is under one administration, known officially as the Kenya and Uganda railway, marine and ancillary services. Since April 1921, when a central railway council was instituted the revenues from this source have been devoted exclusively to transport purposes; and in Feb. 1926 the office of High Commissioner of Transport was created, it being held by the Governor of Kenya. In 1911–2 a branch line (91 m.) was built to the Magadi soda lake; another railway (32 m.) was built from Nairobi to the Thika river (towards Mount Kenya). In 1915–6, for military purposes, a railway was built from Voi *via* Taveta to Kahe in (then) German East Africa. It links the Uganda railway with the Tanga railway. The Voi-Taveta line was bought by the Uganda railway in 1923 and reconditioned.

In 1921 a bold policy of railway development, accompanied by harbour improvements, was adopted, both to meet the needs of the settlers in the Uasin Gishu and Trans-Nzoia districts and the requirements of Uganda for the transport of its cotton crop. It was decided to build a line from Nakuru on the Uganda railway across the Uasin Gishu plateau to the border of Uganda, whence it would be continued to the Nile. By 1925 this railway had reached Turbo, 145 m. from Nakuru, and the next section of 75 m. to Tororo, inside the Uganda Protectorate, was under construction. In 1923–6 the Nairobi-Thika line was extended another 90 m. to Nyeri, and other smaller branch lines built. Road development was slow, but a motor road was made from Nairobi to Tanganyika Territory and another motor road from Nairobi to the Sudan. There are aerodromes at Kisumu and Nairobi.

Revenue.—Since 1912 the country has been self-supporting. Between 1909–10 and 1913–4 revenue increased from £503,000 to £1,123,000 and expenditure from £669,000 to £1,115,000. In 1920–1, the last year in which the railway returns were included in the ordinary budget, the figures were, revenue £2,978,786, expenditure £2,976,960, a surplus of £1,826 only. In 1922 and 1923 expenditure considerably exceeded revenue, but in 1924 revenue was £2,111,665 and expenditure £1,861,511—a surplus of £250,054—evidence that the years of acute commercial depression had passed. At the end of 1924 the funded public debt of Kenya was £8,500,000, incurred principally for transport development. The railway revenue in 1924 amounted to £1,635,000, and the gross expenditure to £878,000.

The Kenya White Paper (Cmd. No. 1922) of 1923 and the Report of the East Africa Commission (Cmd. No. 2387) 1925, are important British official publications, of which a full list is given in the *Colonial Office List* (London, yearly). See also the annual *Reports* issued by the Colonial Office, and the annual railway, native administration and other *Reports* issued at Nairobi; Lord Cranworth, *A Colony in the Making* (1912) and *Profit and Sport in British East Africa* (1919); C. W. Hobley, *Bantu Beliefs and Magic* (1912); Norman Leys, *Kenya* (1924); *A Handbook of Kenya Colony and Protectorate*, a British Admiralty publication (1920); *The East African Red Book, 1925–6* (Nairobi, 1925), and the *Year Book and Guide to South and East Africa* (London, annually). (F. R. C.)

KENYON, SIR FREDERIC GEORGE (1863–), British scholar, was born in London Jan. 15 1863. Educated at Winchester and New College, Oxford, he became a fellow of Magdalen College, Oxford, in 1888. The following year he was appointed an assistant in the British Museum, and became in 1898 assistant keeper of MSS. In 1909 he was appointed director and principal librarian. Created K.C.B. in 1912, he was president of the Classical Association in 1913, of the British Academy 1917–21 and of the Society for the Promotion of Hellenic Studies 1919–24. In
1918 he became professor of ancient history in the Royal Ac
emy. He was created G.B.E. in 1925. Among his numer
published works are three editions of Aristotle's *Constitut*
of Athens (1891, 1904, 1920); *Classical Texts from Papyri in*
British Museum (1891); *Catalogue of Greek Papyri in the Bri*
Museum (1893, 1898, 1907); *Our Bible and the Ancient Ma*
scripts (1895); *Palaeography of Greek Papyri* (1899); *Handb*
to the Textual Criticism of the New Testament (1901, 19
A student of Elizabeth and Robert Browning's poetry, in 1
he edited the centenary edition of Robert Browning's wo
In 1914 he published an account of the buildings of the Bri
Museum.

KER, WILLIAM PATON (1855–1923), British man of lett
was born at Glasgow Aug. 30 1855 and educated at Glas
University and Balliol College, Oxford. He was elected fello
All Souls College in 1879, professor of English literature and
tory at Cardiff in 1883 and of English literature at Univers
College, London, in 1889, a post which he held until 1922.
1920 he was elected professor of poetry at Oxford. His stu
of mediaeval literature were specially noteworthy, and among
publications were *Epic and Romance* (1897); *The Dark A*
(1904); *Essays on Mediaeval Literature* (1905); *Sturla the H*
torian (1907); *The Art of Poetry* (1923); and a number of collec
essays and lectures published in 1925. But these last work
this singularly inspiring teacher, a scholar of wide and hum
sympathies, were posthumous. He died suddenly in the A
at Macugnaga on July 17 1923 and was buried there.

KÉRATRY, ÉMILE, COMTE DE (1832–1904), French aut
and politician (*see* 15.753), died in Paris April 7 1904.

KERENSKY, ALEXANDER FEODOROVICH (1881–
Russian politician, was born at Simbirsk, and studied at
University of St. Petersburg, where he took his degree in law,
afterwards joined the St. Petersburg Bar. In 1912 he was ele
to the Fourth Duma and joined the Labour Group. He wa
reality an adherent of the Social Revolutionary party, but
was impossible in those days to enter the Duma under this
he chose the Group of Toil (Labour) in preference to the S
Democrats, whom he considered to be too pedantic and dis
from the people. As a member of the Duma he attained a cer
notoriety by impassioned speeches, but he was never
spicuous for constructive statesmanship. When the first rev
tionary Government was formed Kerensky was nomin
Minister of Justice and was for a short time head of the provisi
Government. (*See* RUSSIA.)

KEY, ELLEN (1849–1926), Swedish author, was born Dec
1849 at Sundsholm, the daughter of Emil Key and Coun
Sophia Posse. She early showed a keen interest in religious, l
ary and political affairs and lectured on various subjects in
native village. In 1868 her father became a member of the R
dag, and the family accordingly moved to Stockholm. It
then that she started to contribute to the feminist perio
Idun. In 1879, owing to family misfortune, she was forced to a
the teaching profession. She also established lecture course
young women. Her success as a lecturer was such that
was able to abandon teaching, and in 1903 went abroad
number of lecturing tours. She wrote numerous works in m
languages, chiefly concerned with the welfare of women
children. Her liberal theories concerning love and marria
the time met with great opposition. She died in April 1
Her principal work is *Tankebilder*, "Ideas," 2 vol. (1898);
Lifslinjer, Eng. tr. "Lines of Life," 3 vol. (1903–6).

See G. Monod in *La Revue Bleue* (1907) and E. Faguet i
Revue Latine (1907).

KEYES, SIR ROGER JOHN BROWNLOW (1872–), B
sailor, was born Oct. 4 1872 and entered the navy in 1885.
took part in the Vitu expedition in 1890 and for his servi
China in 1900 was promoted commander. From 1905 to
he served as naval attaché at Rome, Vienna, Athens and
stantinople. In 1912 he was appointed commodore in c
of the submarine service. During the World War he took
in the battle of Heligoland Bight, Aug. 1914, and in the Cuxh

In 1915 he became chief of staff to Admiral de Robeck, in
mand of the Eastern Mediterranean Squadron in the
ianelles. He was promoted rear-admiral in 1917, appointed
:tor of plans at the Admiralty and later took command of
Jover Patrol. In this capacity he directed the naval raid on
rugge and Ostend, April 23 1918, and was rewarded with
K.C.B. In 1919 he was created a baronet and received a
t of £10,000 in recognition of his services. He commanded
Battle Cruiser Squadron of the Atlantic Fleet from 1919
l 1921 when he was promoted vice-admiral and became depu-
iief of the naval staff. In 1925 he was appointed commander-
uief of the Mediterranean Station.

EYNES, JOHN MAYNARD (1883–   ), British economist,
born at Cambridge, June 5 1883, the son of John Neville
nes, registrar of Cambridge University. Educated at Eton
King's College, Cambridge, where he was 12th Wrangler
5), and president of the Union Society (1905), he entered
civil service in 1906 and from 1906 to 1908 served at the India
e. He was a member of the royal commission on Indian
ice and currency 1913–4, and in 1915 he joined the Treasury,
e during the World War he did important work in connec-
with loans to the Allies. At the Paris Peace Conference he
the chief representative of the Treasury and deputised for
Chancellor of the Exchequer on the Supreme Economical
ncil, Jan.–June 1919. He advocated certain principles which
onsidered should be applied to the financial and reparation
es of the Peace Treaty with Germany and when they were
ted he signified his disagreement with the treaty by resign-
n June 1919, and published in the same year his famous
Economic Consequences of the Peace. He was made fellow
subsequently bursar of King's College, Cambridge. In
he became chairman of *The Nation*, Ltd. In 1925 he mar-
Lydia Lopokova, the famous Russian dancer. His works
de *Indian Currency and Finance* (1913); *A Treatise on
ability* (1921); *A Revision of the Treaty* (1922); and *A Tract
onetary Reform* (1923).

YSERLING, HERMANN, Count (1880–   ), German
sopher, was born at Könno in Livonia on July 20 1880, of a
family. Until he was 14 years of age, Keyserling remained
e Könno and Rayküll estates. He then went to the Russian
l at Pernau, and afterwards studied geology and zoology at
va, chemistry at Dorpat, and geology at Heidelberg. In
he became a doctor of philosophy and in 1903 went to Paris,
he wrote criticisms on art, and also philosophical articles.
rst literary works were *Das Gefüge der Welt* (1906) and
erblichkeit (1907). During the years 1907–11 he travelled
rope. In 1910, the *Prolegomena zur Naturphilosophie* ap-
d, and he then turned his attention to the study of meta-
cs. In 1919 he married the granddaughter of Prince
arck. His principal work is *Das Reisetagebuch eines Philoso-*
(1919), which has been translated into English as *The
Diary of a Philosopher* (1925). He also founded the
ool of Wisdom" at Darmstadt. See H. Keyserling, *Der
zur Vollendung* (Darmstadt, 1919).

IVA (*see* 15.777), was once the capital of the Khroahrezm
blic, whose territory has now been absorbed into Turkmen-
(*see* Siberia). Khiva has always held a unique status
ssian Asiatic dominions and even now is understood to be
together with a small area surrounding the town, adminis-
directly from Moscow, though the surrounding country
part of other political units.

MIL PASHA (1832–1915), Turkish statesman, was the
an artillery officer, Salih Agha. Having completed his mili-
raining in Egypt as a cavalry lieutenant, he was appointed
Khedive, Abbas Pasha, tutor in English to his son Ibrahim
. In 1861 Kibrizli Mehemmed Pasha took him into the serv-
the Ottoman Government. He was twice governor of Je-
m and three times governor of Beirut. In 1878 he was ap-
d governor of Kossova and soon afterwards of Aleppo, with
nk of Pasha. He resigned as the result of the British pro-
gainst his conduct during the Armenian revolt at Zeitoun,
turning to Constantinople became Under-Secretary for the Interior. In 1881 he became minister of Evkaf, and after the resignation of the Kutchuk Said Pasha Cabinet in that year, Grand Vizier. In spite of his forced resignation from the governorship of Aleppo he steadily pursued a pro-British policy. He resigned the Grand Vizirate in 1887 owing to Russian intervention, but was reappointed in 1896. He was dismissed by Sultan Abdul Hamid, however, owing to his proposal that a Cabinet responsible to the nation should be formed, and was sent to Smyrna as governor, where he remained for 12 years.

After the promulgation of the constitution (1908) Kiamil Pasha joined the Kutchuk Said Pasha Cabinet and soon after became Grand Vizier for the third time. He was, however, strongly opposed by the Union and Progress party. During the Balkan War (1912) he became Grand Vizier for the fourth time, but was forced to resign in 1913 as the result of a military coup d'état and the unpopularity of the peace terms accepted by him. He retired to Egypt, and although he returned later to Constantinople he was forced by the Government immediately to leave. He went to Cyprus and died there in 1915. Kiamil Pasha knew English, French and Arabic and published a book on Turkish history in three volumes.

KIEL CANAL (*see* 11.816 and 15.787).—The Kiel Canal connects the North Sea and the Baltic. The sluices at the entrances at Holtenau (the harbour of Kiel) and Brunsbüttelkoog (mouth of the Elbe) are 1,082·6 ft. long, 147 ft. wide and 45·9 ft. high. The canal is 53·3 nautical m. long and 37·07 ft. deep. Vessels are admitted on it which do not exceed the following dimensions: depth 29·7 ft., width 131·2 ft., length 1,033·5 ft., height of masts over the water line 131·2 feet. Steam and motor-propelled vessels pass up the canal under their own power. The highest speed permitted is 8·1 knots, the lowest 5·4. Other vessels are tugged, either by private tugs or the tugs of the canal administration, as desired. Pilots are compulsory. They come on board outside the canal wharves in front of the entrances and are advisers to the ships' captains, who remain responsible for the conduct of their ships while using the canal.

Management.—The Kiel canal is owned by the German Reich, which administers it through the Reichskanalamt in Kiel. The managing director in Kiel and the port captains at the entrances to the canal are in charge of the shipping and the administration of their sluices under the Reichskanalamt. Special officials are in charge of the preservation of the canal works. Art. 380–386 of the Treaty of Versailles (June 28 1919) lay down certain regulations respecting the Kiel Canal. Canal and pilotage dues are limited to a rate sufficient to cover the cost of administration, maintenance and improvements. All mercantile and war vessels of nations at peace with Germany have permanent free use of the canal, without special permission, and on an equal footing (but as foreign ships of war pass through German territorial waters in approaching or leaving the canal they are expected to obtain permission through diplomatic channels). Subjects, goods and vessels of all nations enjoy equal treatment as regards payments and attention. Traffic on the canal is subject only to general police, shipping and sanitary and customs regulations. Goods in transit arrive under seal or are accompanied by customs officers and are not subject to any further customs formalities. In the event of violations of any of these conditions, or of disputes as to the interpretation of them, any interested Power can appeal to the jurisdiction instituted for the purpose by the League of Nations. A local German authority at Kiel is qualified to deal with disputes in the first instance.

The Kiel Canal being the safest, most convenient, shortest and cheapest route from the North Sea and the Baltic is increasingly used by merchant vessels. In 1913, 53,382 ships passed with 10,350,000 tons net displacement; in 1924, 45,843 ships with 14,070,000 tons net displacement. (M. C. M.)

KINDERSLEY, SIR ROBERT MOLESWORTH (1872–   ), British financier, was born Nov. 21 1872 and educated at Repton School. He entered upon a business career in London and became a partner in the banking firm of Lazard Bros. and Company. During the World War he became widely known to the public as president of the National Committee for War Savings. His services were recognised with the award of a K.B.E. in 1917 and three years later he was created G.B.E. He became a director of the Bank of England and in 1924 was appointed a member of the body which prepared the Dawes scheme after inquiring into Germany's capacity to pay her War debts. (*See* SAVINGS MOVEMENT.)

KINEMATOGRAPH: *see* MOTION PICTURES.

KING, WILLIAM LYON MACKENZIE (1874–), Canadian statesman, was born at Berlin—now Kitchener—Ontario, Dec. 17 1874, the son of John King and Isabel Grace, daughter of William Lyon Mackenzie, M.P., who had been prominent in the struggle for political freedom in 1837. He was educated at Toronto University, and became fellow of political economy in the University of Chicago and of political science in Harvard University. Mr. King entered the public service of Canada in 1900 as deputy Minister of Labour, and acted as editor of *The Labour Gazette* for some years. He was chairman of several royal commissions on industrial and immigration problems. In 1906 he represented Canada in negotiations with the British Govt. on immigration from Britain, and in the same year the honour of C.M.G. was conferred on him. He was Canadian representative to the Govt. of India on immigration from the Orient and was one of the British delegates on the International Opium Commission in China in 1909. He was elected as a Liberal member of Parliament for North Waterloo in 1908, and in 1909 was appointed Minister of Labour in the Laurier administration.

From 1914–7, under the auspices of the Rockefeller Foundation, Mr. King investigated the subject of industrial relations, and afterwards wrote *Industry and Humanity, a Study in the Principles Underlying Industrial Reconstruction* (1918), as well as other studies on economic subjects. During the World War he assisted leading industrial corporations in America to maintain a continuous maximum output of essential war supplies, and industrial representation plans were drafted under his direction which were adopted by the Colorado Fuel and Iron Co., the Bethlehem Steel Corporation, the Bethlehem Shipbuilding Corporation, the General Electric Co., the Consolidation Coal Co., the International Harvester Co. and other industrial corporations in America. At the National Liberal Convention at Ottawa in 1919 he was selected as the successor to Sir Wilfrid Laurier, and became leader of the Opposition in the same year. In 1921 he became Prime Minister of Canada, and in this capacity he attended the Imperial conference in 1923.

As Premier.—Mr. King's administration followed the Coalition Govt. which had been created during the War, and, although formerly there had been two parties in the House, a third party, known as the Progressives, was also returned in the general elections of 1921. It was this party which supported the Liberal Government. On the dissolution of the House in 1925 an attempt was made to return to the two-party system of government, but the Progressives were still given support. The Prime Minister himself was defeated, together with several of his ministers, but owing to the support and co-operation of the Progressives he was enabled to retain control. After the War many new problems arose, and both the Conservatives and the Liberals declared their policy. An able speaker, Mr. King in his appeal to the electorate urged the adoption of a tariff for revenue, and suggested that the problem of taxation could be solved with the aid of an advisory board on taxation. He also stated his willingness to give the principle of public ownership of railroads a fair trial, though he was averse to either a privately or publicly owned railway monopoly. The Liberal party further advocated the reform of the Senate of Canada by fixing an age limit, and by abolishing the life tenure of office for senators. The object of this reform was to make the Senate more responsive to public opinion. Mr. King maintained that the principle of Canadian nationalism could best be developed within the British Empire, and that the bonds of Empire would be strengthened by reciprocal trade treaties. He stated that no attempt would be made to dictate to Great Britain how she should tax her people. The policy of the Liberal party as expressed by Mr. King may be summed up as "unity, moderation and progress." (A. G. D.)

KIPLING, RUDYARD (1865–), British man of letters 15.825).—The appearance of *Puck of Pook's Hill* in 1906 ma the last attempt of Kipling to essay any new kind or mann writing. With one doubtful exception, all his later books ca referred to the existing categories. In 1909 appeared an authorised volume called *Abaft the Funnel*, into which an A can publisher collected a number of unprinted sketches stories belonging to the period 1888–90. Mr. Kipling issue authorised edition in New York (1909), but it has never published in England. The first authorised collection to f *Actions and Reactions* (1909), was *Rewards and Fairies* (191 companion volume to *Puck of Pook's Hill*, and neither b nor worse than its predecessor. This pair of volumes tri create for the young a semi-historical mythology of the En countryside.

The attempt was quite well worth making, and some o stories and verses are good; but they are not told simply eno Mr. Kipling's love of England is not of the kind that goes t making of myth. In 1911 Mr. Kipling joined Mr. C. R Fletcher in the production of a *History of England* for the yo His contribution took the form of 24 poems, some of which happily stimulative to the historical imagination, thoug read with the accompanying text, presenting to the you rather limited view of national duty. The years from 19 brought nothing but reprints and recensions, notably *S from Books* (1913), containing the verses and chapter head from all the volumes except the *Jungle Books* and *Jus Stories.*

Mr. Kipling inevitably contributed to the literature of War. For several newspapers he wrote poems and sets of art the most important of the latter being *The New Army in Tr ing* (1915), *France at War* (1915), *The Fringes of the Fleet* (1 *Tales of the Trade* (1916), and *Destroyers at Jutland* (1916). last three were collected into a volume called *Sea Warfare* (1 In 1917 appeared *A Diversity of Creatures*, a collection of st and verses in the old manner, clever, but not attractive. Ano volume of poems, *The Years Between* (1919), contained occasi verses written in war time, with some others of earlier date. volume is vaguely accusatory and oracular, and contains as m of the publicist as of the poet. In the same year appeared pamphlet *The Graves of the Fallen*, describing the work of Imperial War Graves Commission. *Letters of Travel* (1920 printed some 24 articles ranging in date from 1892 to 1914, showed how little the author had changed in style and ma over a long period. The one work by Mr. Kipling that lay ou his usual range was *The Irish Guards in the Great War* (1 a lengthy and competent compilation, including some ori matter in the old familiar manner. *Land and Sea Tale Scouts and Guides* (1923) intended for the instruction or insp tion of the young, is unworthy of the author and the purpose. Kipling received many honours from universities at home abroad, and in 1922 was elected Rector of St. Andrews. rectorial address, which was published as *Independence* (1 attracted much attention.

Mr. Kipling is, like Macaulay, a writer who remained to end what he was at the beginning. Some of his writing better than others, but none of them are older or younger others. His earliest work conveys a sense of full experienc latest has no other sign to post-maturity than a growing ace and tendency to scold. His immense efficiency was never o kind in which genuine growth or development is possible such as it was it remained undecayed. Mr. Kipling's pr clear, firm, tense and terse and the shaping of his best stor admirable. He possessed (as Shakespeare possessed) the jou ist's ability to use with apparent mastery the "cant" of m trades and callings: but this gift, though engaging, is artisti unimportant. Mr. Kipling often wrote as a publicist; but as a creative writer that he must be judged. Regarded mere a political teacher he would have to take a low place. No l or consistent or even practical body of doctrine can be dr from his vague accusations and rhetorical warnings, and, ind none need be looked for. The creeds of poets are more impor

emselves than to their readers. Mr. Kipling did his best
for Empire, not by thinking or writing imperially, but by
ling India artistically.
. Kipling always worked in the spirit of a good craftsman.
gh immediately popular as a writer, he never sought per-
publicity, and never consciously wrote down to the
dlings, even of politics. His general style indicates a long
of the Bible and his metres show that the influence of
burne was strong and enduring upon him. Admiration of
iblical prophets, however, produced in both writers a tend-
to the large, cloudy, oracular utterance that appears more
und than it is. But in all essentials, Mr. Kipling is an orig-
and underived writer. He noticeably added to the public
of quotations and to the repertory of poems known to
body. Few writers have found such a large body of sin-
admirers in so many regions, ranks and callings of British
e.

Jan. 15 1922.

TCHEN EQUIPMENT: *see* HOUSEHOLD APPLIANCES.

TCHENER, HORATIO HERBERT KITCHENER, EARL
–1916), British field-marshal (*see* 15.838).—Kitchener was
oted field-marshal just before he left India in 1909, and the
of St. Patrick was conferred on him on his arrival in
nd in 1910; but between India and England had occurred
t to Australasia, where he had been invited to examine the
ry arrangements, and where the very thorough suggestions
he made for their improvement were acted on with a
ptitude which bore full fruit in 1914.

cept for his command of the troops at the coronation of
George, Kitchener was now for the first time for nearly 40
to enjoy some months of leisure; but the failure of the
rnment to employ him aroused unfavourable comment,
was only silenced when in the late summer of 1911 he
ted the post of British agent and consul-general in Egypt.
next three years were perhaps the happiest of his life; he
n familiar circumstances though he had many changes to
since he had handed over the Sirdarieh to Sir Francis
ate.

the day he landed at Alexandria, Italy was presenting an
atum to Turkey, and there is no doubt that Kitchener's
nce and his prestige were mainly responsible for the safe
ge of Egypt through the critical period of the Tripoli and
n wars, and that no one but himself would have been able
event collisions between the Greek and Italian colonists
he natives. His idea was to keep the country busy with
ontemplation of its own affairs, and he initiated a policy of
mic reform the effects of which were to be enduring. His
amme comprised such items as village savings banks, the
'eddan law, the opening of cotton markets all over the
ry, cantonal courts, the promotion of the Department for
ulture to a ministry, school buildings, sanitation and press
vision, and the heightening of the Aswan dam—all of ab-
g interest to him, all receiving his assiduous care. Lord
er's great service in Egypt had been rewarded by an earl-
while he was still at the Agency, and the Prime Minister
ed the King that no lesser title should adorn his successor
g his tenure of the office. The *London Gazette* of June 1914
nced that the sovereign had been pleased to confer on Viscount Kitchener the honour of an earldom, and the telegram announcing his new dignity reached him just as he was starting for England on his annual leave.

At the War Office.—Kitchener had intended that leave to last until Sept., but on July 31 all heads of missions were ordered to repair to their posts, and on Aug. 3 Kitchener was actually on board the Channel boat when a message arrived from the Prime Minister requiring him to stay in England. Three days later he took over the seals of the War Office, to find, in his own words, "There is no army." The meaning of that trenchant observation was that for the titanic task the country had undertaken the British miniature Expeditionary Force, however gallant, was manifestly inadequate. Kitchener instantly laid his plans for an army of 70 divisions, coolly calculating that its maximum strength would be reached during the third year of the War, just when the enemy would be undergoing a sensible diminution of his resources in man-power. His scheme, of course, ran clean contrary to all accepted ideas: it had always been held that in time of war, though armies could be expanded, they could not be created, and to imagine otherwise seemed as surprising to our friends as to our enemies. The French general staff gracefully remarked that men had called new armies into being and men had utilised and maintained existing armies, but that for Lord Kitchener it was reserved to perform the two feats simultaneously. The Germans derided the Kitchener plan as impracticable.

In the early days of 1916 Kitchener could tell the Cabinet that 67 divisions were afoot and three in the mould; he was met by a representation that we must choose between a diminution of our forces and a reduction of our monetary advances to our Allies. He declined the dilemma. He did not think that England could present either of these conclusions to her Allies without proof positive that expenditure could not be reduced nor national income increased, that her administration was free from extravagance, that her taxable capacity was fully exploited and that all parts of the Empire were pulling their weight. The conflict of opinion was sharp and short, with the upshot that the 70 infantry divisions were assured of their existence, and the way was prepared for the Kitchener armies to take their part in the battle of the Somme which he knew was planned for the coming summer. "I have no fear," he said, "about winning the War; I fear very much we may not make a good peace." If he did not live to take his place at Versailles, at least as regards the creation and placing in the field of the great force which was to hold high England's honour he could review a finished work, for his last division to go overseas took ship the very day on which he himself set out on the journey from which he was not to return.

Kitchener's vision or intuition served him to protest, though vainly, against the concentration of the original B.E.F. so far forward as Maubeuge; his rapid and accurate grasp of a situation caused him to hurry to France after the retreat from Mons to insist, in the name of the Government, on the British Army remaining in the Allied line; and enabled him in 1915 to pronounce that the evacuation of the Gallipoli peninsula could be effected with infinitely less loss than had been gloomily predicted. Apart from these occasions he did little to interfere with the actual conduct of operations in the field. He knew and sympathised with the commanders, gave full consideration to their views, and did all that lay within human power to provide them with what was necessary for the performance of the duties assigned to them: moreover, he gave them his entire trust and his unswerving support; what this means to a commander perhaps only those with the experience of a commander can realise, and Kitchener himself had tasted of that experience.

Of the great difficulties which beset the Secretary for War, perhaps the greatest and the most discussed was that of providing guns and ammunition for a constantly and rapidly increasing army. The real root of the trouble was that the nation had plunged into Armageddon without armaments; there was not only a lamentable lack of munitions, but a total absence of all machinery for producing them. With barely means to keep the original expeditionary force on its feet, Kitchener had to provide for a long and far-flung struggle with a powerful enemy who for 40 years had devoted himself to preparation. A friend who in the early weeks of the War noted in him signs of strain asked him if he were sleeping well. "I shall never have a good night's rest," he answered, "until I have 2,000,000 rifles and their ammunition, and that cannot be yet." The output of arms and ammunition—when one remembers that a start was made from zero and that at the battle of Neuve Chapelle more stuff was fired than in the whole South African campaign—reached an amazing total in the first nine months of the War, and no finer provision of material was made from end to end of it. It was alleged at one time that the great production of ammunition in the autumn of 1915 was due to the energy of the newly born Ministry of Munitions, and a confident claim was made on behalf of this department to the increased supply of high explosive shells. Before the end of the War Kitchener's work was challenged in some quarters on this point; the answer furnished by the dossier of the master-general of ordnance presented a defence of the War Office, whence, as a matter of fact, came the first proposal of high explosive for use in France.

To be precise, the Ministry of Munitions was set up during the first week of June 1915. It was not until the end of Oct. 1915 that a single component of ammunition worth speaking of was delivered from the Ministry of Munitions' factories or orders, and not until April 1916 that the first complete round, made and filled under the orders and arrangements of the Ministry, was delivered to the army authorities. In other words, the army, for a period of more than 18 months, was furnished with continually increasing supplies under the former arrangements.

With the change of the Government in 1915, when the Prime Minister and the War Secretary alone retained their offices, an unhappy attempt was made from G.H.Q. in France to inflame public opinion against the man to whom a few weeks earlier the Commander-in-Chief had written, "Thank God you are there, and I mean it." The attempt failed to shake the rock of public confidence on which Kitchener stood, right up to and even beyond, his last hour: messages of goodwill poured in to him from camps at home and overseas, and from every class and community and corner of England; a month later he received, on his way to and from the Guildhall, one of the greatest ovations of his life—and the Order of the Garter. If Kitchener did not travel quite easily on political lines, his close personal touch with England's Allies was not the least of his contributions to the War, and his early and constant friendship with France gave him, so to speak, a flying start in gaining the best relationships with her public servants.

Russia's rôle was to him a matter of vital importance if the War was to be brought even within his own three year's limit; but in the autumn of 1915 he said to Joffre at Chantilly, "You are calculating on Russia remaining till the end of the War; I am making my calculations on her being out within six months." He had not been afraid to commit himself to serious responsibilities as to arming and equipping the almost weaponless Russian hosts, but even so it is as difficult to account for, as it is impossible to deny, the almost uncanny influence which his name exercised throughout the great eastern empire. He was thus able to criticise Russian methods with a freedom and to press his advice—more especially at the critical moment when Italy was hanging back—with an insistence that would have been tolerated at the hands of no other foreigner.

Proposed Visit to Russia.—Early in May 1916 the Tsar urged that Kitchener should visit Russia, promising that his counsel would be taken to the full even if that counsel included certain transfers of control into British hands. The consent of the British sovereign was obtained, and it was decided that Kitchener should start from Scapa Flow on June 5 for Archangel. He was asked to examine thoroughly the whole Russian situation: he was given a free hand to make arrangements and conditions which he thought advisable; he was to use all the influence which he had already acquired with the Tsar and the Russian military authorities to set the Russian military house in order, and he was asked to come back to England with all speed.

On the afternoon of the appointed day, Kitchener, h
paid a visit to Lord Jellicoe on his flagship, embarked o
"Hampshire," which was directed to proceed on what, wit
prevailing wind—as reported—would be the lee side o
Orkneys and Shetlands. The arrangements made for the v
of the cruiser have been, and perhaps always will be, op
question. It is at least certain that an unswept channe
chosen for her passage and that, under stress of weathe
destroyers who formed her titular escort turned about, le
the vessel, with her priceless freight, to steam to her doo
faithful steward had suddenly to give an account of his ste
ship. The same electrical impulse which the next mornin
claimed Kitchener's death to the world induced an emo
current so intense as to lack precedent or parallel. For a mo
it seemed as if a hush had fallen as universal as it was prof
and when the hush was broken there was exposed in fu
sway which Kitchener had established over the hearts and
of all sorts and conditions of men, and that the one m
England who had taken the least pains to win popularity
the hero of many peoples.

A week later the sovereign and his consort passed throug
throngs in and around St. Paul's Cathedral to a simple serv
hymn and prayer; simultaneously, at two-mile intervals
the sea to the Somme, British soldiers bade a *vale* to the
soldier; while in all parts of the world where two or three En
men were gathered together the name of a great Englishma
commemorated. The Queen-Mother at once placed hers
the head of a movement to secure a permanent and pra
memorial, and in answer to her appeal there poured in
every point of the Empire—from men, women and childr
all colours, classes and creeds—a stream of money, gatheri
volume until it reached the astonishing sum of over £70
On Dec. 10 1925 a memorial chapter in St. Paul's Cathedra
dedicated to Earl Kitchener and all who fell in 1914–8.

(G. A

KLEIN, FELIX (1849–   ), German mathematician,
born at Düsseldorf April 25 1849, and after studying at th
versities of Bonn, Göttingen and Berlin was appointed pro
of mathematics at the University of Erlangen. He later to
similar professorships at the Munich Technical College a
the universities of Leipzig and Göttingen (1886), and f
became at the latter university director of the school of m
matical physics. Klein, who became a member of the Pr
Academy of Sciences, specialised in the practical applicat
mathematics and mechanics, and in conjunction with A. Son
field worked on the problem of gyratory motion. He took s
interest in educational questions, and his well-known treat
the teaching of mathematics in Germany appeared in
Among Klein's other works should be mentioned *Vorles*
über das Ikosaeder und die Auflösungen der Gleichunge
fünften Grad (1884) and *Vorträge über ausgewählte Frage*
Elementargeometrie (1895).

KLINGER, MAX (1857–1920), German painter, etche
sculptor (*see* 15.847), died July 4 1920 at Grossjena near N
burg.

KLUCK, ALEXANDER VON (1846–   ), Prussian ge
was born May 20 1846 at Münster, Westphalia. He took
in the Austro-Prussian War of 1866 and the Franco-Prussia
of 1870, and was twice wounded at the battle of Colo
Neuilly. In 1906 he was promoted to the rank of gene
infantry, and at the outbreak of the World War was insp
general of the VIII. Army Inspection. He was placed in
command of I. Army of the West, which he led in the batt
Maubeuge and St. Quentin and the advance upon the M
(*See* FRONTIERS, BATTLES OF THE.) At the battle of the M
the faulty disposition of the German forces in the line of
and the success of the Allied offensive compelled Von Klu
withdraw his army to the Aisne positions. (*See* MARNE,
BATTLE OF THE.) In March 1915 he was wounded while vi
the front trenches, and was placed on the retired list in Oct.
He gave his account of the earlier operations in *Der Mars*
Paris und die Marne-Schlacht (1920).

:NIGHT, DANIEL RIDGWAY (1845–1924), American artist 15.851), died in Paris March 9 1924. Of his paintings, ailing the Ferry" is in the Pennsylvania Academy, Phila- ohia, and "The Shepherdess" in the Brooklyn Institute seum.

:NIGHTHOOD AND CHIVALRY (*see* 15.851).—The following nges have taken place among the orders of knighthood and valry since 1910. While many orders have disappeared, eral have been instituted since that date.

lustria-Hungary.—The World War, closed the history of the ers belonging to the Dual Empire.

British Empire.—As was inevitable, the huge number of people aged in the World War made it necessary that appointments ll the British Orders should be made on a greatly increased e, while two additional Orders were instituted. A change in method of wearing the badge of the Third Class (Companion) ome British Orders was made. Where it used to be worn lal-fashion on the left breast, it is now hung round the neck. *rder of the British Empire.*—This was instituted in June 1917, eward War services in all capacities, military and civil. In 8 a Military Division of the Order was created. The essential ures of the latest statute of the Order, published on Dec. 29 2, are as follows:—

here are five classes of the Order, which (like the Order of the n) is divided into military and civil divisions. Each class can be erred upon men and women equally.

ighest Class—Knights Grand Cross and Dames Grand Cross 3.E.).
econd Class—Knights Commander and Dames Commander 3.E. and D.B.E.).
hird Class—Commanders (C.B.E.).
ourth Class—Officers (O.B.E.).
fth Class—Members (M.B.E.).

he two highest classes of the Order wear a star, which is of silver, vo designs. In the centre is a golden medallion showing a repre- ation of Britannia seated, surrounded by a circlet of crimson nel bearing the motto of the Order, "For God and the Empire." he members of the first class wear the larger star on the left st, and the badge of the Order (*see* below) is also worn on the , which, in the case of men, is $3\frac{3}{4}$ in. wide, in the case of women, . wide, and crosses the breast from the right shoulder to the left the badge resting on the hip. A collar has been instituted for class.

ne members of the second class wear the smaller star on the left st, with the badge suspended, in the case of men, by a ribbon . wide passing round the neck, and in the case of women, from w of ribbon of the same width, placed on the left side, above the The third class wear the badge, in the case of men, from a on of the same width as the second class round the neck, and, e case of women, from a bow on the left side. The fourth and classes wear the badge on the left breast, from a ribbon $1\frac{1}{2}$ in. , medal-fashion in the case of men, from a bow in the case of en.

ne badge is a cross patonce, bearing in the centre the medallion circlet as in the star. An imperial crown in gold surmounts the . For the first three classes the cross is enamelled in pearl grey, ered with gold, while the circlet is of red enamel with the motto old. The commander's badge is smaller than that for the other classes. The badge of the fourth class is entirely silver gilt, e that of the lowest class is entirely silver. The ribbon of the r is purple for the civil division, and purple with a narrow red ral stripe for the military division.

nere are also two medals belonging to the Order: The gallantry al, which is rare, and is only awarded for conspicuous bravery, e the recipient knew, when he performed the deed of gallantry, his life was in danger, and the meritorious service medal, for meritorious service.

ompanion of Honour.—This order was instituted in June 1917, ne same time as the Order of the British Empire. It may be erred upon either men or women who have rendered con- uous national service, and for whom the distinction is deemed nost appropriate form of recognition, constituting, as it does, onour dissociated either from acceptance of title or classi- ion of merit, for it confers no title or precedence, simply the ls "C.H." after the recipient's name.

consists of the Sovereign and 50 members, and there is only class.

e insignia consists of a badge, worn by men suspended from the on of the Order which is passed round the neck, and by women ended from a bow of ribbon placed upon the left shoulder.

The badge is oval, and consists of a blue circlet ensigned with the imperial crown in enamelled colours and bearing in letters of gold the motto of the Order, "*In Action Faithful and in Honour Clear.*" In the centre is an oblong plaque, with thereon, on the dexter a representation of a mounted knight in armour, and on the sinister an oak tree, from the boughs of which hangs a shield charged with the Royal Arms. The ribbon is $1\frac{1}{2}$ in. wide, of carmine silk with an interlaced border of gold wire.

The Order ranks next to, and immediately after, the first class of the Order of the British Empire.

Estonia.—This country has established the *Liberty Cross.*

Finland.—The chief Finnish Order is the *White Rose of Finland.*

Germany.—Officially, the old Orders of the German Empire have ceased to exist, but they are still worn in many cases.

Greece.—In addition to the *Order of the Redeemer* (*see* 15.865), the *Order of George I.* was instituted in 1912, and has six classes—collar, grand cross, grand commander, officer, knight and companion. There are also two medals of the Order, silver and bronze. The ribbon is red.

Owing to the establishment of the Greek Republic, it is possible that some changes may be made with regard to these two Orders.

Latvia.—Latvia has instituted the *Order of the Three Stars.*

Persia.—It is not improbable that the new Shah may alter the present chief Persian Order, the *Timsal-I-Humayun* (the Shah's portrait), but the *Lion and the Sun* may still be continued.

Poland.—Since the restitution of Poland's freedom, the old Polish *Order of the White Eagle* has been re-instituted.

This is the premier Polish Order, only awarded for most exceptional services. There is only one class. The ribbon is light blue.

The origin of the *Order of Polonia Restituta* needs no explanation. There are five classes—grand cordon, grand officer, commander, officer and chevalier. The insignia is worn after the fashion of that of the French Legion of Honour. The badge is a white cross with the Eagle of Poland thereon, and the ribbon is of the Polish national colours, red, with white edges.

Russia.—All the Russian Orders of Chivalry have been discontinued, though they still continue to be worn by adherents of the monarchy who have refused to acknowledge the present régime.

Egypt.—In the days before the World War, services rendered to the Egyptian Govt. were recognised by the award of the Turkish Orders of the Osmanieh and Medjidieh (*see* 15.867), but the change in the administration of the country made it inevitable that these would disappear, and that the King of Egypt would institute new Orders. There are now six of these:—

Order of Mohammed Ali, instituted in 1915 in memory of the founder of the present dynasty. The premier Egyptian Order and rare. Three classes—collar, grand cordon and commander. Star and Badge similar in design, consisting of a sun of which the rays are alternately gold and silver; upon this is a six-pointed green star, each point terminating in a golden lotus flower. In the centre is a green enamelled disc, with the Arabic inscription "Mohammed Ali" surrounded with an inscription to the effect that "Clemency, Justice and Generosity are the strength of a Reign." The ribbon is of watered green silk with a white line close to each edge. Two medals, gold and silver, belong to the Order. They bear on the obverse the Arabic inscription, "Honour to Bravery."

Order of Ismail, instituted 1922 in memory of the father of King Fuad. Second Egyptian Order. For eminent services rendered to Egypt. Four classes grand cordon, grand officer, commander and officer. The Badge is a five-pointed azure-blue enamelled star, having in the centre a round plaque with the Arabic inscription "Ismail" surmounted by a wreath of laurel with red knots. Star is similar, but has silver rays between the angles. The ribbon is dark blue with a stripe of red towards each edge.

Order of the Nile, instituted in 1915, for useful service rendered to Egypt. Five classes—grand cordon, grand officer, commander, officer and chevalier. The badge and star are of practically the same design, and consist of a star of 10 rays, alternately gold and silver, thereon a white enamel five-pointed star surmounted by the crown of Egypt. In its centre is a golden disc with an Arabic inscription in blue, "What benefits does Egypt owe to the Nile, the source of her prosperity and happiness." The crown in the badge is placed between the two top rays. The ribbon is of watered blue silk, with a golden-yellow stripe at each edge. The officer has a rosette on his ribbon.

Order of Al Kamal, instituted in 1915, is for ladies only. Four classes—"Decoration of Al Kamal," first, second and third classes. The decoration is in brilliants, and is reserved for the Queen of Egypt and princesses of royal blood. The insignia is a star enriched with precious stones, worn on the left breast, and a cordon of light blue watered silk with golden edges, which, passing over the right shoulder, suspends a jewelled badge resting on the left side. The insignia of the first class (grand cordon) is similar in appearance and is worn after the same fashion, but it is not jewelled. The second and third classes wear a badge on the left breast, attached to the ribbon of the Order which is tied on in a bow, the second class having a rosette thereon. The star is gold, charged with ten ornamental flowers, and bearing in the centre the inscription "Al Kamal," surrounded by the words "Charity," "Duty," "Devotion," "Nobility," and "Pity." The badge is a star, of which the 10 rays are formed by the same flowers as on the star, surmounted by the Crown, and bearing the inscription "Al Kamal" in the middle.

Order of Agriculture, established 1915, is a reward for services rendered to agriculture. There are two classes—commander and chevalier. The insignia of the commander is a badge, attached to the ribbon of the Order, worn round the neck, while that of the chevalier is a similar badge worn medal-wise on the left breast. The badge is a five-rayed star, enamelled white, with leaves and pods of the cotton plant enamelled in colour. In the centre in green Arabic characters is the inscription, "Decoration of Agriculture," and above this, between the top rays a cartouche inscribed in Arabic, "He who sows, reaps." Above all is the Royal Crown in gold. The ribbon is watered silk, striped with green and golden-yellow.

Order of the Military Star of King Fuad.—This dates from 1919, and is conferred on natives and foreign officers of the Egyptian Army. It is a white enamel five-pointed star, suspended from a bar. The obverse is bordered with gold, each arm having a golden fillet in the centre. The centre is enamelled in red and blue (the colours of the Royal House of Egypt), and bears a garland of laurel surmounted by the Royal Crown which surrounds two crossed sabres of oriental type. The reverse bears the inscription in Arabic, "The Military Star of King Fuad." The ribbon has five equal stripes of blue, chamois, black, chamois and blue. Bars may be awarded for additional services. (A. V. W.-H.)

KNOWLEDGE, THEORY OF.—Theory of knowledge is a product of doubt. When we have asked ourselves seriously whether we really know anything at all, we are naturally led into an examination of knowing, in the hope of being able to distinguish trustworthy beliefs from such as are untrustworthy. Thus Kant, the founder of modern theory of knowledge, represents a natural reaction against Hume's scepticism. Few philosophers nowadays would assign to this subject quite such a fundamental importance as it had in Kant's "critical" system; nevertheless it remains an essential part of philosophy. It is perhaps unwise to begin with a definition of the subject, since, as elsewhere in philosophical discussions, definitions are controversial, and will necessarily differ for different schools; but we may at least say that the subject is concerned with the general conditions of knowledge, in so far as they throw light upon truth and falsehood.

It will be convenient to divide our discussion into three stages, concerning respectively (1) the definition of knowledge, (2) data, (3) methods of inference. It should be said, however, that in distinguishing between data and inferences we are already taking sides on a debatable question, since some philosophers hold that this distinction is illusory, all knowledge being (according to them) partly immediate and partly derivative.

I. THE DEFINITION OF KNOWLEDGE

The question how knowledge should be defined is perhaps the most important and difficult of the three with which we shall deal. This may seem surprising: at first sight it might be thought that knowledge might be defined as belief which is in agreement with the facts. The trouble is that no one knows what a belief is, no one knows what a fact is, and no one knows what sort of agreement between them would make a belief true. Let us begin with belief.

Belief.—Traditionally, a "belief" is a state of mind of a certain sort. But the behaviourists deny that there are states of mind, or at least that they can be known; they therefore avoid the word "belief," and, if they used it, would mean by it a characteristic of bodily behaviour. There are cases in which this usage would be quite in accordance with common sense. Suppose you set out to visit a friend whom you have often visited before, but on arriving at your destination you find that he has moved, you would say "I thought he was still living at his old house." Yet it is highly probable that you did not think about it at all, but merely pursued the usual route from habit. A "though or "belief" may, therefore, in the view of common sense, shown by behaviour, without any corresponding "menta occurrence. And even if you use a form of words such as is su posed to express belief, you are still engaged in bodily behavio provided you pronounce the words out loud or to yourself. Sh we say, in such cases, that you have a belief? Or is somethi further required?

It must be admitted that behaviour is practically the sa whether you have an explicit belief or not. People who are of doors when a shower of rain comes on put up their umbrell if they have them; some say to themselves "it has begun rain," others act without explicit thought, but the result exactly the same in both cases. In very hot weather, both h man beings and animals go out of the sun into the shade, if th can; human beings may have an explicit "belief" that the sha is pleasanter, but animals equally seek the shade. It wou seem, therefore, that belief, if it is not a mere characteristic behaviour, is causally unimportant. And the distinction truth and error exists where there is behaviour without expli belief, just as much as where explicit belief is present; this shown by the illustration of going to where your friend used live. Therefore, if theory of knowledge is to be concerned wi distinguishing truth from error, we shall have to include the cas in which there is no explicit belief, and say that a belief may merely implicit in behaviour. When old Mother Hubbard we to the cupboard, she "believed" that there was a bone the even if she had no state of mind which could be called cogniti in the sense of introspective psychology.

Words.—In order to bring this view into harmony with t facts of human behaviour, it is of course necessary to take a count of the influence of words. The beast that desires shade a hot day is attracted by the sight of darkness; the man c pronounce the word "shade," and ask where it is to be foun According to the behaviourists, it is the use of words and th efficacy in producing conditional responses that constitu "thinking."[1] It is unnecessary for our purposes to inqu whether this view gives the whole truth about the matter. Wh it is important to realise is that verbal behaviour has the cha acteristics which lead us to regard it as pre-eminently a mark "belief," even when the words are repeated as a mere bod habit. Just as the habit of going to a certain house when y wish to see your friend may be said to show that you "believ he lives in that house, so the habit of saying "two and two a four," even when merely verbal, must be held to constitu "belief" in this arithmetical proposition. Verbal habits are, course, not infallible evidences of belief. We may say eve Sunday that we are miserable sinners, while really thinki very well of ourselves. Nevertheless, speaking broadly, verb habits crystallise our beliefs, and afford the most convenie way of making them explicit. To say more for words is to f into that superstitious reverence for them which has been t bane of philosophy throughout its history.

Belief and Behaviour.—We are thus driven to the view tha if a belief is to be something causally important, it must be fined as a characteristic of behaviour. This view is also forc upon us by the consideration of truth and falsehood, for beha iour may be mistaken in just the way attributable to a fa belief, even when no explicit belief is present—for example, wh a man continues to hold up his umbrella after the rain has stopp without definitely entertaining the opinion that it is still ra ing. Belief in this wider sense may be attributed to animals for example, to a dog who runs to the dining-room when he hea the gong. And when an animal behaves to a reflection in a loo ing-glass as if it were "real," we should naturally say that "believes" there is another animal there; this form of words permitted by our definition.

It remains, however, to say what characteristics of behavio can be described as beliefs. Both human beings and animals so as to achieve certain results, *e.g.*, getting food. Sometim they succeed, sometimes they fail; when they succeed, the ant beliefs are "true," but when they fail, at least one is . There will usually be several beliefs involved in a given of behaviour, and variations of environment will be neces- to disentangle the causal characteristics which constitute various beliefs. This analysis is effected by language, but d be very difficult if applied to dumb animals. A sentence be taken as a law of behaviour in any environment contain- ertain characteristics; it will be "true" if the behaviour to results satisfactory to the person concerned, and other- it will be "false." Such, at least, is the pragmatist defini- of truth and falsehood.

---

[1] See J. B. Watson, *Behaviorism* (1925).

uth in Logic.—There is also, however, a more logical method scussing this question. In logic, we take for granted that rd has a "meaning"; what we signify by this can, I think, be explained in behaviouristic terms, but when once we acquired a vocabulary of words which have "meaning," an proceed in a formal manner without needing to remember "meaning" is. Given the laws of syntax in the language re using, we can construct propositions by putting together vords of the language, and these propositions have meanings h result from those of the separate words and are no longer rary. If we know that certain of these propositions are we can infer that certain others are true, and that yet others alse; sometimes this can be inferred with certainty, some- s with greater or less probability. In all this logical manip- on, it is unnecessary to remember what constitutes meaning what constitutes truth or falsehood. It is in this formal n that most philosophy has lived; and within this region a deal can be said that is both true and important, without need of any fundamental doctrine about meaning. It even s possible to define "truth" in terms of "meaning" and t," as opposed to the pragmatic definition which we gave a ent ago. If so, there will be two valid definitions of "truth," gh of course both will apply to the same propositions.

ne purely formal definition of "truth" may be illustrated simple case. The word "Plato" means a certain man; the "Socrates" means a certain other man; the word "love" ns a certain relation. This being given, the meaning of the plex symbol "Plato loves Socrates" is fixed; we say that complex symbol is "true" if there is a certain fact in the d, namely, the fact that Plato loves Socrates, and in the rary case the complex symbol is false. I do not think this unt is false, but, like everything purely formal, it does not e very deep.

ncertainty and Vagueness.—In defining knowledge, there wo further matters to be taken into consideration, namely, legree of certainty and the degree of precision. All knowledge ore or less uncertain and more or less vague. These are, in a e, opposing characters: vague knowledge has more likeli- l of truth than precise knowledge, but is less useful. One of aims of science is to increase precision without diminishing ainty. But we cannot confine the word "knowledge" to t has the highest degree of both these qualities; we must ude some propositions that are rather vague and some that only rather probable. It is important, however, to indicate ueness and uncertainty where they are present, and, if possi- to estimate their degree. Where this can be done precisely, ecomes "probable error" and "probability." But in most s precision in this respect is impossible.

II. THE DATA

advanced scientific knowledge, the distinction between t is a datum and what is inferred is clear in fact, though etimes difficult in theory. In astronomy, for instance, the are mainly certain black and white patterns on photo- hic plates. These are called photographs of this or that part ne heavens, but of course much inference is involved in using n to give knowledge about stars or planets. Broadly speak- quite different methods and a quite different type of skill required for the observations which provide the data in a ntitative science, and for the deductions by which the data shown to support this or that theory. There would be no reason to expect Einstein to be particularly good at photographing the stars near the sun during an eclipse. But although the distinction is practically obvious in such cases, it is far less so when we come to less exact knowledge. It may be said that the separation into data and inferences belongs to a well-developed stage of knowledge, and is absent in its beginnings.

Animal Inference.—But just as we found it necessary to admit that knowledge may be only a characteristic of behaviour, so we shall have to say about inference. What a logician recognises as inference is a refined operation, belonging to a high degree of intellectual development; but there is another kind of inference which is practised even by animals. We must consider this primitive form of inference before we can become clear as to what we mean by "data."

When a dog hears the gong and immediately goes into the dining-room, he is obviously, in a sense, practising inference. That is to say, his response is appropriate, not to the noise of the gong in itself, but to that of which the noise is a sign: his reaction is essentially similar to our reactions to words. An animal has the characteristic that, when two stimuli have been experienced together, one tends to call out the response which only the other could formerly call out. If the stimuli (or one of them) are emotionally powerful, one joint experience may be enough; if not, many joint experiences may be required. This characteristic is totally absent in machines. Suppose, for instance, that you went every day for a year to a certain automatic machine, and lit a match in front of it at the same moment at which you inserted a penny; it would not, at the end, have any tendency to give up its chocolate on the mere sight of a burning match. That is to say, machines do not display inference even in the form in which it is a mere characteristic of behaviour. Explicit inference, such as human beings practise, is a rationalising of the behaviour which we share with the animals. Having experienced A and B together frequently, we now react to A as we originally reacted to B. To make this seem rational, we say that A is a "sign" of B, and that B must really be present though out of sight. This is the principle of induction, upon which almost all science is based. And a great deal of philosophy is an attempt to make the principle seem reasonable.

Whenever, owing to past experience, we react to A in the manner in which we originally reacted to B, we may say that A is a "datum" and B is "inferred." In this sense, animals practise inference. It is clear, also, that much inference of this sort is fallacious: the conjunction of A and B in past experience may have been accidental. What is less clear is that there is any way of refining this type of inference which will make it valid. That, however, is a question which we shall consider later. What I want to consider now is the nature of those elements in our experiences which, to a reflective analysis, appear as "data" in the above-defined sense.

Mental and Physical Data.—Traditionally, there are two sorts of data, one physical, derived from the senses, the other mental, derived from introspection. It seems highly questionable whether this distinction can be validly made among data; it seems rather to belong to what is inferred from them. Suppose, for the sake of definiteness, that you are looking at a white triangle drawn on a black-board. You can make the two judgments: "There is a triangle there," and "I see a triangle." These are different propositions, but neither expresses a bare datum; the bare datum seems to be the same in both propositions. To illustrate the difference of the propositions: you might say "There is a triangle there," if you had seen it a moment ago but now had your eyes shut, and in this case you would not say "I see a triangle"; on the other hand, you might see a black dot which you knew to be due to indigestion or fatigue, and in this case you would not say "There is a black dot there." In the first of these cases, you have a clear case of inference, not of a datum.

In the second case, you refuse to infer a public object, open to the observation of others. This shows that "I see a triangle" comes nearer to being a datum than "There is a triangle there." But the words "I" and "see" both involve inferences, and cannot be included in any form of words which aims at expressing a bare datum. The word "I" derives its meaning, partly, from memory and expectation, since I do not exist only at one moment. And the word "see" is a causal word, suggesting dependence upon the eyes; this involves experience, since a new-born baby does not know that what it sees depends upon its eyes. However, we can eliminate this dependence upon experience, since obviously all seen objects have a common quality, not belonging to auditory or tactual or any other objects. Let us call this quality that of being "visual." Then we can say: "There is a visual triangle." This is about as near as we can get in words to the datum for *both* propositions: "There is a triangle there," and "I see a triangle." The difference between the propositions results from different inferences: in the first, to the public world of physics, involving perceptions of others; in the second, to the whole of my experience, in which the visual triangle is an element. The difference between the physical and the mental, therefore, would seem to belong to inferences and constructions, not to data.

It would thus seem that data, in the sense in which we are using the word, consist of brief events, rousing in us various reactions, some of which may be called "inferences," or may at least be said to show the presence of inference. The two-fold organisation of these events, on the one hand as constituents of the public world of physics, on the other hand as parts of a personal experience, belongs to what is inferred, not to what is given. For theory of knowledge, the question of the validity of inference is vital. Unfortunately, nothing very satisfactory can be said about it, and the most careful discussions have been the most sceptical. However, let us examine the matter without prejudice.

III. METHODS OF INFERENCE

It is customary to distinguish two kinds of inference, Deduction and Induction. Deduction is obviously of great *practical* importance, since it embraces the whole of mathematics. But it may be questioned whether it is, in any strict sense, a form of inference at all. A pure deduction consists merely of saying the same thing in another way. Application to a particular case may have importance, because we bring in the experience that there is such a case—for example, when we infer that Socrates is mortal because all men are mortal. But in this case we have brought in a new piece of experience, not involved in the abstract deductive schema. In pure deduction, we deal with x and y, not with empirically given objects such as Socrates and Plato. However this may be, pure deduction does not raise the problems which are of most importance for theory of knowledge, and we may therefore pass it by.

Induction.—The important forms of inference for theory of knowledge are those in which we infer the existence of something having certain characteristics from the existence of something having certain other characteristics. For example: you read in the newspaper that a certain eminent man is dead, and you infer that he is dead. Sometimes, of course, the inference is mistaken. I have read accounts of my own death in newspapers, but I abstained from inferring that I was a ghost. In general, however, such inferences are essential to the conduct of life. Imagine the life of a sceptic who doubted the accuracy of the telephone book, or, when he received a letter, considered seriously the possibility that the black marks might have been made accidentally by an inky fly crawling over the paper. We have to accept merely probable knowledge in daily life, and theory of knowledge must help us to decide when it really *is* probable, and not mere animal prejudice.

Probability.—Far the most adequate discussion of the type of inference we are considering is obtained in J. M. Keynes's *Treatise on Probability* (1921). So superior is his work to that of his predecessors that it renders consideration of them unnecessary. Mr. Keynes considers induction and analogy together, and regards the latter as the basis of the former. The bare essence of an inference by analogy is as follows: We have found a number of instances in which two characteristics are combined,
and no instances in which they are not combined; we find a
instance in which we know that one of the characteristic
present, but do not know whether the other is present or abs
we argue by analogy that *probably* the other characteristic is
present. The degree of probability which we infer will
according to various circumstances. It is undeniable that
do make such inferences, and that neither science nor daily
would be possible without them. The question for the logic
is as to their validity. Are they valid always, never or so
times? And in the last case, can we decide when they are va

Limitation of Variety.—Mr. Keynes considers that mere
crease in the number of instances in which two qualities
found together does not do much to strengthen the probabi
of their being found together in other instances. The import
point, according to him, is that in the known cases the instan
should have as few other qualities in common as possible.
even then a further assumption is required, which is called
principle of limitation of variety. This assumption is stated
follows (p. 256): "That the objects in the field, over which
generalisations extend, do not have an infinite number of
dependent qualities; that, in other words, their characteristi
however numerous, cohere together in groups of invariable c
nection, which are finite in number." It is not necessary
regard this assumption as *certain;* it is enough if there is so
finite probability in its favour.[1]

It is not easy to find any arguments for or against an *a pri*
finite probability in favour of the limitation of variety. It shou
be observed, however, that a "finite" probability, in
Keynes's terminology, means a probability greater than so
numerically measurable probability, *e.g.,* the probability of
penny coming 'heads' a million times running. When this
realised, the assumption certainly seems plausible. The stro
est argument on the side of scepticism is that both men a
animals are constantly led to beliefs (in the behaviouris
sense), which are caused by what may be called invalid indu
tions; this happens whenever some accidental collocation
produced an association not in accordance with any objecti
law. Dr. Watson caused an infant to be terrified of white rats
beating a gong behind its head at the moment of showing it
white rat (*Behaviorism*, p. 126). On the whole, however, ac
dental collocations will usually tend to be different for differe
people, and therefore the inductions in which men are agre
have a good chance of being valid. Scientific inductive or an
logical inferences may, in the best cases, be assumed to have
high degree of probability, if the above principle of limitation
variety is true or finitely probable. This result is not so defini
as we could wish, but it is at least preferable to Hume's comple
scepticism. And it is not obtained, like Kant's answer to Hum
by a philosophy *ad hoc;* it proceeds on the ordinary lines
scientific method.

Grades of Certainty.—Theory of knowledge, as we have see
is a subject which is partly logical, partly psychological; t
connection between these parts is not very close. The logic
part may, perhaps, come to be mainly an organisation of wh
passes for knowledge according to differing grades of certaint
some portions of our beliefs involve more dubious assumptio
than are involved in other parts. Logic and mathematics on t
one hand, and the facts of perception on the other, ha
the highest grade of certainty; where memory comes in, t
certainty is lessened; where unobserved matter comes in, the ce
tainty is further lessened; beyond all these stages comes what
cautious man of science would admit to be doubtful. The attem
to increase scientific certainty by means of some special ph
losophy seems hopeless, since, in view of the disagreement
philosophers, philosophical propositions must count as amon
the most doubtful of those to which serious students give a
unqualified assent. For this reason, we have confined ourselve

---

[1] The argument which leads to this conclusion is long and techni
cal. It has been criticised by Jean Nicod, *Le Problème logique d*
l'Induction (Paris, 1924), whose contentions are rebutted by M
R. B. Braithwaite in *Mind* (Oct. 1925). The outcome is to justify
Mr. Keynes in the main, though not in every detail.

discussions which do not assume any definite position on losophical as opposed to scientific questions.

KNOX, PHILANDER CHASE (1853–1921) (*see* 15.882d), Amern politician, was born at Brownsville, Pa., May 6 1853. He duated from Mount Union College, Alliance, O., in 1872 and s admitted to the Bar in 1875. The following year he was pointed assistant U.S. Attorney for the western district of nsylvania. In 1877 he opened an office in Pittsburgh and n developed a lucrative practice. In 1901 he was appointed orney-general by President McKinley and was retained by esident Roosevelt. While he was attorney-general many imtant suits were instituted, notably those against the "Beef ust" and the Northern Securities Company. He resigned in 04, having been appointed to fill the unexpired term of Matw S. Quay, deceased, as Senator for Pennsylvania, and was elected to serve 1905–11. In 1909 he resigned to enter the binet of President Taft as Secretary of State, holding that ce for four years. He was again returned to the Senate for 7–23. In 1920 he offered a resolution declaring that war with rmany was at an end, which was adopted by both Senate and use, but was vetoed by President Wilson. A similar joint olution of Congress was approved by President Harding July 921, and a formal treaty of peace with Germany signed Aug. He died in Washington, D.C., Oct. 12 1921.

KNUTSFORD, SYDNEY GEORGE HOLLAND, 2ND VISCOUNT 855–), eldest son of the first Viscount Knutsford, was rn on March 19 1855. He was educated at Wellington and at inity Hall, Cambridge, where he secured honours in law and tinguished himself in athletics. He was called to the bar in 79, and in 1883 married Lady Mary Ashburnham, daughter of 4th Earl of Ashburnham. He succeeded to the title on the ath of his father in 1914. He became a director of the Underound Electric Railways Co. and other important companies, d was associated with a number of philanthropic enterprises. was appointed chairman of the London Hospital, and his oposal that certain city churches should be demolished in ler to provide funds for the sustentation of hospitals, though attracted several supporters, embroiled him in controversy.

KOBE, Japan, with a population of 714,976 in 1921 (including 27 foreigners, largely Chinese), has increased in importance a port as a result of the earthquake of 1923. A considerable rt of the trade of Yokohama was diverted to it, and part of this nsference will probably be permanent, owing to the excellent lway facilities of Kobe. The foreign population has also inased. Large sums have been spent on port improvement and d reclamation, and work is still in progress. In 1922 there re four quays, with berths for 19 vessels, and 19 more berths re projected for the completion of the extension scheme. A ge shipbuilding yard, the fourth, was opened in 1917. In 1910 bed of the Minatogawa river was reclaimed; the upper part s been made into a park, with a city hall and large market. e tramways have been extended to Hyogo, which is now adnistratively a part of Kobe. The city stretches five miles beeen the hills and the river, and is extending rapidly towards aka, with which it is connected by electric railway; the hill of kko-Zan behind the city has become a favourite summer resort. any Japanese have erected office buildings in the settlement, ich is well laid out. The water supply, previously very inadeate, has been extended. Although the south and southwest rts of Japan are supposed to be immune from serious earthakes, a shock in the neighbourhood of Kobe caused considerle damage and some loss of life in May 1925.

KODÁLY, ZOLTÁN (1882–), Hungarian composer, was rn at Kecskemét, Hungary, Dec. 16 1882. He studied under ans Koessler at the Budapest Academy of Music, where he became professor of composition in 1907. A leading exponent of the ultra-modern tendency in Hungarian music, he devoted himself enthusiastically to the collection and arrangement of Hungarian and Slovak folk-songs and his pioneer work in this connection was of great importance; for he and Bartók discovered a certain type of Hungarian national music, of a much greater purity and originality than the popular gipsy-music. This had a remarkable effect in transforming modern Hungarian music, and in opening up a new perspective. In his arrangement of folk-songs, Kodály successfully penetrated their inner meaning, and preserved their poetic spirit. His musical criticisms have appeared in Hungarian, American, French and Italian papers. His works include *Johannes Hary*, a musical comedy; *Psalm LV.*, for chorus and orchestra; two string quartets; a trio for strings; sonatas, piano solos, songs, etc.

KOKOSCHKA, OSKAR (1886–), German poet and painter, was born at Pöchlarn, Austria, March 1 1886. He was an expressionist, and produced a number of semi-dramatic works, written in whimsical vein, in which the problems of life were treated in a somewhat loose and vague manner. *Mörder, Hoffnung der Frauen* (1907), *Der brennende Dornbusch* (1911), *Hiob* (1917) and *Orpheus und Eurydike* (1918) were first published in the *Sturm* and afterwards appeared in collected form under the title of *Vier Dramen* (1919). *Mörder, Hoffnung der Frauen* and *Hiob* were performed for the first time in Dresden in 1919 and *Der brennende Dornbusch* was produced in Berlin under Kokoschka's direction by the "Junge Deutschland." In his staging of this piece Kokoschka revealed much original talent. His verse is, for the most part, complementary to the accompanying pictures. His poetical works include *Die träumenden Knaben* (Vienna, 1908; Leipzig, 1917); *Der weisse Tiertöter* (1920); *Der gefesselte Kolumbus* (1921); and among his more notable pictures and drawings are "Auswanderer" and "Der irrende Ritter." See Paul Westheim, *O. Kokoschka* (1919).

KOLÁČEK, FRANTIŠEK (1851–1913), Czech physicist, studied in Prague under E. Mach and in Vienna under Stefan. In 1882 he was appointed lecturer at the Brno (Brünn) Polytechnic, and in 1891 became professor of mathematical physics at the Charles University in Prague. His numerous publications (mostly in Czech and German) dealing with electromagnetic and optical theory and hydrodynamics include: "Dispersionserklaerung nach der elektromagnetischen Lichttheorie" (*Ann. der Physik* 1887, 1888), which gives the first explanation of dispersion on the basis of Maxwell's electromagnetic theory; "Theorie der Doppelbrechung" (*ibid.*, 1892); *Theorie des Kerr'schen Reflexion Phaenomens* (Prague, 1895); "Ueber Magnetostriktion" (*Phys. Zeitschr.*, vol. 6, p. 143, 1905), and "Zur Theorie der elektromagnetischen Gleichungen in bewegten Medien" (*Ann. der Physik.*, vol. 23, p. 698, 1907), which derives electromagnetic equations for moving media independently of the electron theory, and arrives at Lorentz equations which are related to a system of co-ordinates connected with the observer, thus satisfying the relativity criterion; also the excellent textbooks *Hydrodynamika* (Prague, 1899), and *Elektřina a Magnetism* (Prague, 1904). Koláček died in Dec. 1913.

KOLCHAK, ALEXANDER VASILIEVICH (1875–1920), Russian admiral, was born in 1875 and entered the Russian Navy in 1888. He served in the Russo-Japanese War of 1904–5 and at the beginning of the World War was in command of a destroyer in the Baltic. In the summer of 1916 Kolchak was appointed commander of the Black Sea Fleet, with the rank of rear-admiral. After the revolution in 1917 he took an active part in the fighting against the Bolshevists in Siberia. On Nov. 18 1918, by a decision of the Russian Govt. at Omsk, Admiral Kolchak assumed the title of Supreme Ruler of Russia. During the first half of 1919 the anti-Bolshevist army under his command met with considerable success but in the summer the army disintegrated, there were risings in the rear, and Omsk, the capital of the Siberian Govt., was captured on Nov. 15 1919. The Government was then transferred to Irkutsk, but after the creation of a new socialist administration at Irkutsk, Kolchak was asked to resign, and on Jan. 4 1920 he signed a ukase transferring his powers to Gen.

Denikin. Later he fell into the hands of the Bolshevists and was shot at Irkutsk on Feb. 7 1920.

KOMURA, JUTARO, Marquess (1855–1911), Japanese diplomat and statesman (*see* 15.892), was foreign minister in the second Katsura administration (1908–11) and died at Hayama Nov. 24 1911.

KOORT, JAN (1883–), Estonian sculptor, was born Nov. 7 1883 in the Tartu (Dorpat) district. He received his artistic training in the Baron Stieglitz Art School at St. Petersburg (Leningrad) and from 1905–8 studied at the École des Beaux-Arts in Paris under Prof. Mercier. For the purpose of completing his training he worked in the private studios in Paris of Adler, R. Collin and Lucas. He was represented in the exhibitions of the Paris spring and autumn salons in 1908 and in the Tartue exhibition, 1909. After a short stay in his own country, Koort again went to Paris in 1910 where he remained until 1915. In 1910 he exhibited in the Helsingfors art exhibition. In 1915 he went to Moscow, where his best work was produced, and in 1915 and 1916 took part in the exhibitions known under the name of “ Mir Iskusstwa.” The Tretjakow Gallery in Moscow acquired his granite “ Frauenkopf ” and the portrait of his wife executed in black granite is in the Moscow Gallery. Koort, who worked in granite, marble and wood, produced various decorative works in memory of those who fell in the Estonian War of Independence. His great talents are most forcibly revealed in a number of finely executed character heads.

KORAN: *see* ARABIC LITERATURE.

KÖRBER, ERNST VON (1850–1919), Austrian statesman, was born at Trieste Nov. 6 1850. He began his career as an official in the Austrian state service, and when the Emperor Francis Joseph was compelled to rely on cabinets of officials in view of the obstruction in Parliament, Körber became minister of trade under Gautsch in 1897, of the interior under Clary in 1899 and Prime Minister in 1900. He was the first man other than an aristocrat to hold this post since Schmerling. Körber attempted to solve the nationalist question by honest negotiation and compromise, but his efforts first to bring Germany and the Czechs in Bohemia to an agreement, and later to solve the language problem by dividing Bohemia into a German, a Czech and a mixed district, broke down. He succeeded in restoring confidence between the Germans and the Crown, but the Czechs renewed their obstruction and Körber was forced to rule, as his predecessors had done, with the help of para. 14 of the Austrian constitution (which allowed a Government to pass any measure on its joint responsibility, with “ provisional validity,” should it prove impossible to pass the measure through Parliament in the ordinary way). Körber employed this expedient on no fewer than 33 occasions. He evolved the Great Austrian canal scheme, the only example of constructive legislation on a large scale in Austria of modern times, which was voted but never carried into action. He was also able to introduce a better spirit into industrial disputes, winning the confidence of masters and men alike.

Körber resigned office in Dec. 1904, when the obstruction of the Hungarian party of independence made it impossible to carry through the periodical compromise with Hungary. He returned to politics as common finance minister in Feb. 1915 and became prime minister for the second time in Oct. 1916 after the murder of Count Stürgkh. His old confidence, however, was gone. He resigned in Dec. 1916 after a fresh dispute concerning the Hungarian compromise and died in Baden, disregarded and embittered, March 5 1919.

KOREA or Chosen.—On Aug. 22 1910 Korea (*see* 15.908) became an integral part of the Japanese Empire, under its ancient name of Chosen, formerly in use for over five centuries and now officially restored. With this event a new era dawned for what was formerly the “ Hermit Kingdom.” The ordered and systematic progress, already inaugurated by Japan in 1906, advanced steadily.

The peninsula of Chosen, with its outlying islands, has an area of 86,000 square miles. It is thus about as large as the mainland of Japan, or about two-thirds of the size of the British Isles. The population on Oct. 1 1920 was 17,264,119, including about 337,000 Japanese and about 23,000 foreigners. The density was on about 208 per sq. m., compared with 376 in Japan and about 3 in Great Britain. On Oct. 1 1924 the population was estimat at 18,677,800. The climate is dry and bracing, without inten variations of cold and heat, and, in contrast to Japan, there an absence of hurricanes and practically no visitation of eart quakes. The country is mountainous, especially in the nort but there are extensive plains, well watered with good rivers, the south and west, where are situated the excellent harbours Fusan, Mokpo, Chemulpho and Chinnampo. The miner wealth of the country is concentrated in the north, while agricu ture is the predominant characteristic of the level and ferti southwest. Chosen's geographical position affords her easy acce to the markets of China, Manchuria and Siberia, and a railwa line now connects her with northern Asia and thus to the hea of Europe.

I. POLITICAL HISTORY

Subsequently to the annexation, the functions of the Japane residency-general and of the Korean Govt. were merged in tho of a governor-general, the first to be appointed being Gen. Te auchi, with Mr. I. Yamagata, son of Prince Yamagata, as admi istrative superintendent. In Oct. 1916 Gen. Terauchi vacate his post to become Premier of Japan, and was succeeded by Ge Count Hasegawa, Mr. Yamagata continuing in office. An impo tant reform effected in this period was the unification of th police and the gendarmerie service, by which a better control the outlying districts was obtained where hitherto the peace an security of the inhabitants had been frequently disturbed b bands of robbers and marauders.

But widespread disturbances took place in March 1919. Th Koreans desired to achieve at one step that measure of “ sel determination ” which President Wilson's utterances appeare to them to justify. The disturbances, however, were quickl subdued, and the Japanese Govt. hastened forward refor measures which had already been contemplated. The heads the administration resigned, and Baron (later Viscount) Makot Saito was appointed governor-general and Dr. R. Midzuno ad ministrative superintendent. The reforms introduced were (1) the extension to civil officials of eligibility to the post of gov ernor-general, hitherto only open to a military officer of the ran of general; (2) the governor-general, formerly only directl responsible to the Throne, to be amenable to the Prime Ministe of Japan; (3) the governor-general to be relieved, even when military officer, of the right to the military command, whic should be exercised only by the commander of the army; (4) th substitution of a police force for the mixed system of gendarmeri and police. The Premier, Mr. Hara, also issued a statement tha the Government were desirous of further eliminating, as tim went on, all differences between Japan proper and Chosen i matters of education, industry and the civil services. A syste of provincial and municipal administration, similar to that i Japan, would also gradually be evolved.

Peace was thus established, although various agitators an malcontents who had fled either to Shanghai or to Manchuri from time to time made abortive attempts to stir up discontent. Episodes which occurred in the autumn of 1920 in the Chienta district, when a Japanese consulate was burned and attacks wer made on peaceful Japanese and other civilians, were subsequentl found to have been engineered by Korean agitators.

II. FINANCIAL AND ECONOMIC HISTORY

Finance.—After the Russo-Japanese War, 1904–5, Japan turne her attention more actively to the reform of Chosen fiscal affairs. Detailed regulations regarding revenue and expenditure were promulgated in June 1906, the system of public tenders was introduced, and a bureau of audit was established. The Seoul branch of a Japanese joint-stock bank was authorised to act as the central treasury of the Chosen Govt., and the post-offices were also entruste with Treasury business. In Sept. 1906 regulations with regard to the collection of taxes were issued and assessors appointed, all being made directly responsible to the Minister of Finance.

A law of 1901, not then put into force, by which the coinage syste was to be made analogous to that of Japan, became operative i June 1905, and it was further provided that the standard money o pan, or bank notes, should become the standard money of Chosen. ius Chosen became a gold country.

In consequence of the steady expansion of financial and economic airs, the Bank of Korea (renamed the Bank of Chosen in 1911) s established as a central bank in Oct. 1909, and took over the ties previously attended to by the First Bank, Ltd. The Bank of iosen, which has an authorised capital of 40,000,000 yen and a paid- capital of 25,000,000 yen, acts as cashier to the Treasury and ndles loan business, and, in addition, is authorised to issue bank tes and to engage in ordinary banking and trust business, such as discounting of drafts and other commercial papers. Also, sub- t to the approval of the Governor-General of Chosen, it may make vances to public corporations without security and represent other nks. Being the principal medium of exchange in Chosen, the lume of the note issue has steadily expanded with the develop- nt of economic affairs in the peninsula. Since Dec. 1917 the notes ve been allowed unlimited circulation in the Kwantung territory d the South Manchuria Railway Co.'s leased districts. At the ne time the notes were made to replace the gold notes formerly ued in Manchuria by the Yokohama Specie Bank, this further elling the volume of circulation bank notes issued by the Korean nks.

In March 1906, during the protectorate régime of Japan, the ricultural and Industrial Bank Regulation was enacted with the ject of giving relief to the straitened money market in the prov- es by the creation of a number of agricultural and industrial nks. The Government extended them help, such as by subscrib- to the capital, making loans free of interest and so forth. By the d of 1917 six head offices and 41 branches had been established in rious parts of the peninsula. In time they were adjudged inade- ate for the rapidly growing industrial and economic requirements, d this resulted in the promulgation in June 1918 of the Chosen lustrial Bank Law, in virtue of which a central bank bearing this le was established in Oct. of the same year by amalgamating the ricultural and industrial banks then existing.

At the end of 1923 there existed in Chosen 18 banks with 58 anches or agencies in addition to their head offices, 17 branch ices and agencies of banks which had their head offices in Japan oper, and at the end of June 1924 as many as 499 local credit sociations with a total membership of 357,000 persons.

The country's ordinary revenue rose from 44,764,559 yen in 1916–7 102,383,844 in 1924–5; while the extraordinary revenue rose from 437,548 yen in 1916–7 to 38,439,857 yen in 1924–5. The total penditure, which in 1916–7 was 57,562,710 yen, was 140,823,701 n in 1924–5.

Foreign Trade.—The external trade of Chosen rapidly increased th the development of her agriculture and industry. Exports, lued at 5,616,608 yen in 1912 (in addition to exports to Japan itself 15,369,009 yen), increased to 20,403,305 yen in 1923 (with 1,262,427 yen to Japan); and imports, 26,359,434 yen in 1912 us 40,756,013 yen from Japan), rose to 98,338,377 yen in 1923 us 167,452,350 yen from Japan).

During the same period the ratio of trade with Japan to that with eign countries may be seen from the following table:—

	Trade with Japan (including Taiwan and Karafuto)	Trade with foreign countries
	%	%
912	67	33
914	72	28
916	75	25
918	81	19
920	70	30
921	79	21
922	76	24
923	77	23

In 1924 the trade with foreign countries amounted to: imports, 882,000 yen, exports 22,495,000 yen.

Government Enterprises.—In 1908 a special Government office was ablished to control and foster the cultivation of the medicinal ant ginseng. The area under cultivation increased to 1,724 ac., e annual value of the medicinal ginseng raised being 2,000,000 yen.

In 1907 the Government commenced operations for the natural aporation of salt, a product hitherto obtained by the artificial boil- process, and the manufacture was developed as a Government terprise. By 1918 saltpans covering an area of 2,528 ac. were in eration, but, as the quantity of salt produced was still insufficient home consumption, in 1920 the Government began laying out an ditional 6,370 ac., the work to be completed in seven years. The t produced in 1923 amounted to 67,000,000 kin (88,600,000 lb.).

The production and manufacture of tobacco has been greatly stered by the Government. The area under cultivation increased om 33,261 ac. in 1915 to 42,525 ac. in 1919, the total value having en from 4,878,127 yen to 14,501,169 yen in the same period. In 23, however, the area had decreased to 19,885 ac., and the total lue for the year was 22,217,642 yen.

Agriculture and Industry.—Rice is the staple agricultural product, followed by barley, Italian millet, soy beans, wheat and red beans, in addition to which there are also such special products as cotton, tobacco, hemp and ginseng. The cultivation of fruit-trees has produced very good results, and the area of their cultivation is gradually extending, fruit-farming having received considerable impetus through the establishment of model agricultural farms. The Government undertook the reorganisation of sericulture in 1906, and the industry is now being carried on everywhere. Both fruit-farming and sericulture are engaged in as subsidiary industries by the agricultural class. The breeding of cattle, horses, goats and pigs is carried on nearly everywhere in the peninsula, though not as an independent enterprise. The cattle are well known for their great size and good quality, and a large number of them are exported annually to Japan proper and Asiatic Russia.

At the time of annexation a large part of the forests and plains of Chosen was in a state of utter desolation, but since the year 1907 afforestation has progressed uninterruptedly, with Government assistance, many private forestry enterprises having also sprung up in various localities. The total area of the forests of Chosen is believed to be about 13,500,000 acres.

The principal native industrial products are: textile fabrics, paper, pottery, metal ware, manufactured tobacco, brewed drinks and leather, but as these works are mostly carried on as subsidiary house industries, the production is insufficient to meet the demand, and even common articles of daily use have in many cases to be imported. With the steady development of manufacturing industries and the rapid strides with which agriculture, mining and other primary industries have grown, Chosen has begun to attract wide attention as a promising field of enterprise, especially in spinning, filature, the manufacture of pulp, cement, beet-sugar, matches, milling and iron founding.

In 1922 there were 53 agricultural companies with a total paid-up capital of 23,988,000 yen, 178 industrial with 27,390,000 yen, 261 commercial with 22,994,000 yen, 79 transportation with 27,694,000 yen and 188 others with 116,883,000 yen, making a total of 759 companies with a capital of 218,950,000 yen.

Mining.—A mining law enacted after the annexation, and made operative on April 1 1916, prohibited foreigners from acquiring mining rights in Chosen unless as a legal Japanese corporation, although the rights existing and already granted to foreigners by the former Korean Govt. were strictly respected. The principal mineral products, in addition to gold, are silver, zinc, copper, lead, iron, tungsten ore, graphite, coal (especially anthracite), quartz sand and kaolin. A number of Japanese mine-owners have recently commenced operations in the peninsula, and mining enterprise shows a steady expansion. The total annual yield of all the mines in the country was as follows:—

1910	6,067,952 yen	1918	30,838,074 yen
1912	6,815,121 yen	1920	24,204,688 yen
1914	8,522,418 yen	1922	14,503,781 yen
1916	14,078,188 yen	1923	17,326,894 yen

Fisheries.—The advance in the fisheries was mainly due to the provisions of the Fishery Law of 1911 under which new fishing associations have been formed, havens for the fishing fleet provided, and proper investigations conducted into the suitability of gear and the movements and location of fish. As a result, the fishing population increased from 93,400 with 16,709 boats in 1910, to 346,349 with 53,118 boats in 1918, the total value of the catch having risen from 7,871,910 yen to 32,863,402 yen in the same period. The total catch in 1923 reached the value of 51,700,000 yen.

Communications.—Some 3,850 m. of road construction and repair were undertaken at Government expense, and the cost of another 1,000 m. was shared between the Government and the local authorities, the total outlay being about 25,000,000 yen. The first railway line in Chosen, between Seoul and Chemulpho, was completed by a Japanese syndicate in 1900 and opened to traffic in Oct. of that year, whilst the same syndicate undertook the construction of the Seoul-Fusan railway (274 m.), which was completed and opened to traffic in Jan. 1905. The trunk line Seoul-Wiju (309 m.), which traverses the peninsula lengthwise, was built by the Japanese Army and completed in 1906. Branch lines were added from time to time, so that by the time Chosen became part of the empire some 759 m. of railway were in operation. By 1923–4 this figure had been increased to 1,189 miles.

Posts, etc.—Since 1910–11 the expansion of the postal, telegraph and telephone services in Chosen has been normal, the number of post-offices having increased from 447 in 1910–1 to 618 in 1922–3, the postal packets from 100,265,041 to 347,779,584 and the parcels from 1,589,722 to 4,565,571. The length of telegraph lines increased in the same period from 3,389 m. to 5,087 m.; the length of wires from 7,740 m. to 19,635 m.; and the number of messages from 7,127,235 to 9,850,157. The length of telephone lines increased from 314 m. to 4,447 m.; the wires from 10,121 m. to 45,704 m.; and the messages from 21,260,918 to 72,328,480.

A great increase both in the number of depositors and the amount of their savings was a feature of the Post-Office Savings Bank in Chosen; in 1911–2 there were 223,599 depositors (4,365,996 yen), and in 1922–3 there were 1,590,470 depositors (19,875,093 yen).

KORNILOV, LAVR GEORGIEVICH (1870–1918), Russian soldier was born July 18 1870 in Ust-Kamenogorodsk, Siberia, his father being a Cossack officer. He entered the army, and was in 1892 commissioned and posted to the Turkistan artillery brigade. He devoted himself to service in Turkistan, whence he undertook journeys into Afghanistan, Chinese Turkistan, Persia and Baluchistan. He saw service as a staff officer in the Russo-Japanese War of 1904–5, and subsequently spent four years (1907–11) as Russian military attaché in Peking. In Galicia, Kornilov commanded an infantry division. He himself was captured and sent to the fortress of Laka, in Hungary, but he managed to escape, reaching Russia in the autumn of 1916. He was at once appointed commander of the XX. Army Corps. At the beginning of March 1917, with the outbreak of the Russian Revolution, Kornilov was appointed to command the troops of the military district of Petrograd.

He found the troops, in such a demoralised state that he asked to be relieved and sent to the front, and at the beginning of May he was made commander of the VIII. Army. Appointed by Kerensky supreme commander-in-chief, Kornilov presented his programme enforcing discipline in the army. The programme was, however, rejected, and this was the beginning of a split between Kerensky and Kornilov and the struggle between them ending in the outbreak of Sept. 8–12; Kerensky gained an apparent victory, and Kornilov was interned in Bikhov. On his release after the November revolution, Kornilov assisted Gen. Alexeyev in forming the Volunteer Army in which he took a command. On March 31 1918 he was killed in the Caucasus by the bursting of a shell.

KOSSUTH, FRANCIS (1841–1914), Hungarian statesman (*see* 15.916), died in Budapest May 25 1914.

KÖVESLIGETHY, RADÓ DE (1862–   ), Hungarian astronomer, was born at Verona, Italy, Sept. 1 1862. Educated at Pozsony and the University of Vienna, he became assistant to H. C. Vogel at Potsdam Observatory and later astronomer at the Ó-Gyalla Observatory. While still a student he evolved from Greenwich observations of velocities in the line of sight a first approximation of solar velocity. He constructed further for the Kis Kartal Observatory a handy and powerful spectrophotometer based on the principle of extinction by polarisation. After a year's collaboration at the Central Institute of Meteo ology and Terrestrial Magnetism at Budapest he became assis ant to Baron Eötvös. In 1897 he was appointed extraordinar and in 1904 ordinary professor of cosmography and geophysi at the University of Budapest. In 1905 he became gener secretary of the International Seismological Association, a pos tion he held till the dissolution of the Association in 1916. I 1905 he founded the Seismological Institute of Budapest. Aft the great earthquake of Messina he investigated the condition under which a rational prevision of earthquakes would be poss ble (*Sur l'hystérisis sismique*, 1912).

KOVNO or KAUNAS (*see* 15.921), with a population of 92 446 in 1923, became the capital of Lithuania in place of Viln (Wilno) when that town was included in Poland. Kovn has changed greatly since the World War. Previously a quie somewhat poor town, with no water supply, gas or moder drainage, it has now electricity and other services and a numb of new buildings, including large shops and theatres. Its im provement is largely due to the fact that the taxes of Lithuani are now spent in the country, since it gained its independence. Lithuanian university, called the Gedimine University in honou of a medieval prince, was opened in 1922. Kovno is the industri centre of the country, nearly one-fifth of the industrial establishments in existence in 1921 being in the city. Kovno was though to be a first-class fortress, but was reduced in a few days b German forces during the World War. Two churches wer wrecked, mills razed and much damage done. Great efforts t Germanise the town were made during the occupation. Th independence of Lithuania was ratified by the Constituent A sembly at Kovno in May 1920.

KRASSIN, LEONID BROISSODICH (1870–   ), Russian pol tician, was born in Kurgan, Tobolsk, the son of a civil servan He was expelled from the St. Petersburg Technical Institute i 1891 for taking part in a political demonstration on the occasio of the funeral of Shelgunov. He was arrested in 1894, 1907 an 1908 and banished for three years to Nijni Novgorod. He combined continuous revolutionary activity with great success i the engineering profession, taking important part in many larg works in Russia and holding eventually a responsible post in th company of Siemens and Schuckert. After the Nov. Revolution 1917, he organised the supply of munitions to the Red Arm during the civil war and became People's Commissar for Trad and Industry. In 1920 he was president of the Soviet delegatio that concluded the trade agreement with England. In 1922 h was a member of the Soviet delegation to Genoa. In London h concluded an agreement with Mr. Urquhart concerning concessions in Siberia, but this agreement was not ratified in Russia owing to the personal intervention of Lenin. When the Commissariats of Internal and Foreign Trade were united, Krassi became assistant commissar. He was for some time Sovie diplomatic representative in Paris and was appointed to Londo at the end of 1925.

KRAUS, KARL (1874–   ), Austrian critic and poet, wa born April 28 1874 at Jičin, Czechoslovakia. He attended th university of Vienna and attracted notice by two brochures *Die demolierte Literatur* and *Eine Kron für Zion*, and by hi periodical, *Die Fackel*. This review, of which he became edito in 1899, was at first largely, and later entirely, written by him It began its career by violent attacks upon abuses in literary theatrical, social and political circles in Vienna, and especiall upon the newspaper Press. Gradually it became the mouthpiec of a pitiless and scathing critic and, though the satirist's poin of view changed in the course of time, the middle classes an the liberal Press always remained the chief objects of Kraus' attack. His satire was most acute in his collected essays *Sittlichkeit und Kriminalität* (1902) and his volume of anti-wa poetry *Die letzen Tage der Menschheit* (1918) was compare with that of Juvenal and Swift. Kraus has great pathos at hi command, but his lyrical talent, as shown in *Worte in Verse* (1918), is cramped by his mordant wit. Nevertheless his influence upon the younger generation in Austria and Germany wa very considerable. As a lecturer upon his own and upon foreig ks, he achieved great success both in his own country and oad. He must also be reckoned, with Lichtenberg, Novalis Nietzsche, among the German masters of aphorism. Kraus's r works include *Sprüche und Widersprüche* (1909); *Pro o et mundo* (1912); *Nachts* (1919).

ee L. Liegler, *Karl Kraus und sein Werk* (1920); B. Viertel, *l Kraus* (1921).

REHBIEL, HENRY EDWARD (1854–1923), American writer critic, was born at Ann Arbor, Mich., March 10 1854. He ied law at Cincinnati 1872–4, but drifted into journalism, oting himself more particularly to musical criticism. He was he staff of the Cincinnati *Gazette*, 1874–80, then editor of New York *Musical Review*, and finally musical critic for the York *Tribune* till his death, which occurred in New York , March 20 1923. He was one of the most influential musical cs of his time, and in addition to lecturing on musical topics, e a number of popular books. Among these are *Studies in nerian Drama* (1891); *How to Listen to Music* (1896); *Music Manners in the Classical Period* (1898); *The Pianoforte and Music* (1911); *Afro-American Folk Songs* (1914); also works aining grand opera plots, motives and music. He was the erican editor of the 2nd ed. of Grove's *Dictionary of Music Musicians* (1904–10), edited Thayer's *Life of Ludwig van hoven*, 3 vol. (1921) and translated a number of foreign ical works.

REISLER, FRITZ (1875–), Austrian violinist, was born ienna Feb. 2 1875. At the age of seven he was admitted to Vienna Conservatoire and in 1887 won the Grand Prix on uation from the Paris Conservatoire, where he studied under senet and Delibes. In 1889 he made a successful tour of the ed States, but then abandoned music for some years, study- medicine and serving in the Austrian Army as an officer in a n regiment. His reappearance on the concert stage in in, March 1899, was followed by a wonderful tour of the ed States and Great Britain in 1900–1, and he later visited chief musical centres of the world. On the outbreak of the ld War in 1914 he rejoined his former regiment, but was nded and discharged from service, thereafter resuming his ical career. He published his war experiences, *Four Weeks e Trenches*, in 1915. He has also written numerous arrange- ts of music for the violin and piano, and his operetta, *Apple soms*, was produced in New York in 1919.

RILOFF, ALEXEI NIKOLAIEVICH (1863–), Russian hematician and naval architect, was born Aug. 3 1863 in yr, Simbirsk province, and educated in the naval school and l academy at St. Petersburg (Leningrad). In 1881 he joined navy. In 1896 and 1898 he read before the Institution of al Architects in London two remarkable papers on the lation of a ship on waves and was awarded the gold medal he Institution. From 1900 to 1908 he was superintendent of xperimental tank at St. Petersburg; and from 1908 to 1910 ctor of naval construction. In 1890 he became professor at naval academy and in 1916 member of the Russian Academy ciences. He devised for the Russian Navy a series of special -grade optical instruments, and published many scientific rs and textbooks, among which the most original are: *Approximative Calculations* (1906) and *On Differential ations of Mathematical Physics* (1912). He was also interested heoretical astronomy and translated into Russian Isaac ton's *Principia* with a valuable commentary, published by naval academy in 1916.

ROGH, SCHACK AUGUST STEENBERG (1874–), Danish iologist, was born at Grenaa and took his doctor's degree in by a thesis on the respiration of frogs. In 1916 he became essor of animal physiology at the University of Copenhagen. gh made important discoveries by his experiments in connec- with respiration, and in 1906 was awarded a prize by the na Academy of Science for the investigations which he ed out and described in a treatise, *Mechanism of Gas ange in Lungs*. In 1920 he was awarded the Nobel Prize for cine for his discovery of the capillary regulation of the con- nce of blood to the muscles. He afterwards continued his investigations of the capillaries and the blood, in which he discovered an element which influences the contraction of the capillaries. (*See* PHYSIOLOGY.)

Among his publications are: *The Respiratory Exchange in Animals and Man* (1916) and *The Anatomy and Physiology of Capillaries* (1922); and articles in *The Journal of Physiology*.

KROHG, CHRISTIAN (1852–1925), Norwegian painter and author, was born at Christiania (Oslo) Aug. 13 1852. After graduating in law, he went to Germany to study painting. During the following 30-odd years he lived alternately at Christiania and in Paris, until in 1909 he was appointed professor and director at the newly founded academy of painters and sculptors, Christiania. Krohg was the pioneer of the art of open-air painting in Norway which had its heyday in the first half of the 'eighties. He specialised in depicting the sea and the life of the pilots, which he rendered with a wonderful vigour and originality of incident and colouring. His deep interest in the social problems of his age is shown in his "Struggle for Existence" (1890) in the Oslo National Gallery. Krohg, besides being an excellent portrait painter, also possessed literary and journalistic talent. A selection of his literary works in four volumes appeared in 1920–1. He died on Oct. 16 1925.

KROPOTKIN, PETER ALEXEIVICH, PRINCE (1842–1921), Russian author (*see* 15.928), returned to Russia in June 1917, and died near Moscow, after a long illness, Feb. 8 1921.

KU KLUX KLAN (*see* 15.942).—On Thanksgiving night in 1915 William Joseph Simmons, preacher, travelling salesman and experienced promoter of fraternal orders, gathered some friends on Stone Mountain, near Atlanta, Ga., before a " fiery cross " and administered the oath of the " Invisible Empire, Knights of the Ku Klux Klan." A state charter gave corporate rights to his organisation. As Imperial Wizard, Simmons could hold office for life and have final authority unless opposed by two-thirds of the Imperial Kloncilium, council of supreme officers and delegates from other states.

Activities of Simmons.—Thus legally established, Simmons called upon the world to witness that his was a " high-class, mystic, social, patriotic, benevolent association " devoted to the sacred duty of protecting womanhood, to the idea of the " Fatherhood of God, Brotherhood of Man," to the principle of "white supremacy "—in short, to " real patriotism " and " pure Americanism." Simmons capitalised the mask of secrecy and roaming by night that had made so effective the old Klan. In the next four years, his order won some 5,000 adherents, mostly in the southern states. They displayed the patriotism of Klansmen on the " home front," against alien enemies, idlers, draft-dodgers, strikers in war industries and immoral women. Nevertheless, the tradition of the old Klan lost vitality. Simmons met financial difficulties. The order would have languished had not new impetus been given.

Growth of the Organisation.—On June 7 1920, Simmons contracted with E. Y. Clarke to increase the membership. As Imperial Kleagle, he was to receive $8 of the $10 admission fee, and $2 for every member added to a local Klan within six months after its organisation. He agreed to pay all expenses of the central office and $75 a week to Simmons. When Clarke's system was perfected, $4 of the original fee went to the local Kleagle, $1 to the King Kleagle or state sales-manager, $0.50 to the Grand Goblin, or head of the local Klan. The remaining $4.50 went to Atlanta. Other revenues accumulated from the sale of regalia by the subsidiary Gate City Manufacturing Company. When Congress made an investigation in Oct. 1921, it found that the Klan had funds enough to purchase an Imperial Palace and to take over control of Lanier University. The Invisible Empire then had a membership little short of 100,000. Expert salesmanship alone, however, did not account for the rapid growth of the Klan. It was not checked by the revelations before the Congressional Committee nor by the devastating attacks of such newspapers as *The New York World*. The control slipped from the grasp of Simmons and Clarke into the hands of Klansmen from the state of Texas and soon the order spread rapidly through the United States.

The Appeal of the Klan.—The appeal of the Klan came to a people suffering from the hysteria of the World War. Those who had enjoyed power in citizens' committees which forced the purchase of Liberty Bonds, intimidated German sympathisers and hounded slackers, saw in the Klan a continued outlet for their patriotism. Those who were outraged by immorality flaunted before inert police used the terror of the Klan to punish evildoers. Those chafed by the deliberation of the courtroom and convinced that the guilty too often slipped through some loophole in the law, found the Klan a direct way to prevent the miscarriage of justice. Whether authorised or not, many acts of violence were perpetrated in the name of the Invisible Empire. But far more numerous were those who cherished the racial and religious prejudices of their ancestors. Kleagles had no difficulty in selling membership in a crusade for Protestant Christianity and native Americanism. In the south, where the negro is a social problem, purity of womanhood and white supremacy are stressed in the creed of Klansmen. On the Pacific coast, Japanese compete with native farmers and labourers. There the cry is against aliens. In the eastern states the Klan is most suspicious of Jews and Catholics. To the Klansman, the Knights of Columbus are in conspiracy against the Constitution to prostrate the American people before the Pope.

From religious hatred the Klan in every section of the United States draws vitality. It has gained its greatest strength in the south and west, among descendants of the first white stock of America, those English and Scotch-Irish pioneers, strong Protestants, who laid the foundations of American society. A secret order offered to such persons escape from the dullness of frontier life into romance with weird ritual, exalted titles and closer friendships. It was the same impetus that during the middle of the 19th century spread "Know Nothing" (*q.v.*) lodges over the land. Jealousy and hatred of the Irish-Catholic newcomers swept them on into politics. For much the same reasons, descendants of the pioneers have joined the Ku Klux Klan and concentrated its power at the polls.

In Jan. 1926 it was impossible to say whether the Klan was still growing, or whether, like its predecessor, the Know Nothing movement, it would prove only another temporary though meteoric organisation.

Simmons, *The Klan Unmasked* (1923); J. M. Mecklin, *The Ku Klux Klan: A Study of the American Mind*, (1924); S. Frost, *The Challenge of the Klan* (1924). (A. B. DA.)

KUN, BELA (1886–), Hungarian politician, was born near Györ, of middle class Jewish parentage. He passed his youth unnoticed, and he eventually entered the University of Kolozsvár, where he graduated in jurisprudence. He intended to become a lawyer, but soon tired of the profession and took up journalism and politics. His upbringing and ideas naturally led him to sympathise with the "under-dog" and he early became an extremely active member of the Socialist party. But his work as a party organiser and agitator did not go beyond the limits of his province, and the same may be said about his influence and popularity. Having entangled himself in the question of the mismanagement of the funds of a workmen's co-operative society, he fell into disgrace and was obliged to withdraw temporarily from public life. He therefore went to Budapest and some time after succeeded in getting a minor post on the socialist daily paper, *Nepszava*.

Soon after the outbreak of the World War he was appointed lieutenant-commander of an ammunition supply column on the Galician front. Captured by the Russians early in the War, he was in Russia at the time of the revolution. He immediately ranged himself on the side of the Bolsheviks and became an apostle of their gospel among the Hungarian prisoners of war. After the Armistice, he planned to return to his country in order to help to win her to Bolshevism. He was already known to, and appreciated by, Lenin. He was therefore furnished with a false passport, and, disguising himself as a Red Cross doctor, succeeded in crossing the frontier together with some of his co
panions in captivity, all anxious to upset the present order.

Although Lenin did not fail to supply Kun with money to
him in his plans, more than money contributed to his succ
namely the critical condition of Hungary at that time: unacc
tomed to self-government, and flooded with crowds of ex-soldi
embittered at finding no employment or means of livelihood a
ready for the first opportunity to revolt. Kun's wild and re
lutionary gazette, *Vörös Ujsag* (*Red News*) which he began
publish soon after his return to Budapest, therefore found
merous readers amongst all those who, for one reason or anoth
disliked the Karolyi Government. Kun soon found himself
conflict with the police and on one occasion shortly before
advent to power was badly injured and imprisoned. He had
yet recovered and was still in gaol when the Karolyi Cabinet a
protest against the harsh conditions of the victorious pow
decided to hand over the government to the Bolsheviks, a
placed Kun at their head.

Kun's programme was to "arm at once, and forcibly trans
every industry and all landed property without conservation i
the hands of the proletariat." At first he collaborated with
Social democrats, but soon shouldered them aside, nationali
all banks, all concerns with over 20 employees, all landed pr
erty over 1,000 acres, every building other than workme
dwellings. All jewellery, all private property above the minim
(*e.g.*, two suits, 4 shirts, 2 pairs of boots and 4 socks) was seiz
servants abolished, bathrooms made public on Saturday nigh
priests, with the insane, criminals and shopkeepers employ
paid assistants were declared incapable of the active or pass
suffrage. International loans of over 10,000 kronen w
repudiated. All this entailed prodigious work and the creat
of a new bureaucracy which was most unpopular. Moreover,
reforms were unsuccessful; in practise the former owners
estates and factories remained on as their managers, the o
difference being that production deteriorated very rapidly a
the State had to pay the wages and make up the deficit. K
started to issue a new currency, which the peasants, alrea
disappointed that the large estates had not been parcelled o
and fearful that their turn would come to be nationalised, refus
to accept. They boycotted the towns; and as the blockade w
still on, the urban population starved, while prices soared.

Kun planned to convert the peasants to communism by fo
of arms; but meanwhile there were foreign campaigns to wa
After a first failure with the "soldiers councils" system, K
and Boehm organised a well-disciplined army, with which th
attacked and defeated the Czech troops occupying Slovak
Kun, who considered himself Lenin's advance guard in Cent
Europe, and held long daily conversations by wireless with
master, made tireless communist propaganda at home and
Vienna, and tried hard and not unsuccessfully to play off t
Allied great and lesser Powers against each other. When, ho
ever, the Entente stopped the Hungarian advance in Slovak
he could no longer appeal to nationalist feelings, and his po
tion became desperate. The peasants were discontented, t
counter-revolution was organising. Kun commenced a "R
terror" against his enemies in Hungary, and again attacked t
Rumanians, but they easily drove his forces back, and he fled
Vienna on Aug. 1. Here he was interned in the local luna
asylum, but after an attempt had been made to murder him
means of poisoned Easter eggs (which, being a Jew, he did n
eat), he was allowed to go to Russia.

Kun was a man of medium size, rather plump, On his sh
neck was a square, massive, bold head. He resembled a sm
shop-keeper rather than a tribune or revolutionary leader.
was, however, the only man amongst the Hungarian Bolshevi
who possessed at the same time an aptitude for ruling a count
and the exalted faith of an apostle. It was this idealism, his fi
belief in the truth of Bolshevism which gave him this superiorit
He was a cruel and violent man only when he thought it nec
sary for the triumph of his ideas. He was, however, impulsi
and incredibly naïve, with an extremely limited knowledge
men. (G. R*.; C. A. M.)

KUPKA, FRANTISEK (1871–), Czech painter, was born Dobruska in Bohemia. He studied at the Academy of Fine ts in Prague, at Vienna and in Paris, where he took up his rmanent residence. His inventive talent, strengthened by a se knowledge of contemporary society and coloured by his eptical outlook, was manifested notably in satirical drawings d caricatures which appeared in such Parisian papers as *corico*, *L'assiette au beurre* and *Le Canard Sauvage.* He be- me known principally through a series of drawings entitled L'Argent" and through his admirable illustrations to the ok *L'homme et la terre* by E. Reclus (1905). In 1908 Kupka ovided the illustrations for a bibliophile edition of *The Fates* C. M. R. Leconte de Lisle and three years later for the Lysis- ta of Aristophanes. He later began to experiment in new ections and looked for a new form of artistic expression. He came an adherent of the tendency known as "Orphism," and oduced large canvases in which the interest of the subject tter is subordinated to the rhythm of the colour scheme. His nical powers of observation, his bold imagery and philosophi- outlook make Kupka one of the most interesting and dis- guished artistic figures of his time.

KURDISTAN (*see* 15.949), is an expression applied to the ographical area stretching north and south from Mount arat down to the river Diyālā, and east and west from Persia the river Kara Su. It is now divided between Turkey, 'Iraq nder British mandate) and Persia, and has a Kurdish pop- tion of approximately 1,500,000 people.

Turkish Kurdistan consists of certain parts of the vilayets of rbekr, Bitlis, Hakkiari, Van, Erzerum and Adana, and is inhabited some of the oldest tribes like the Millis, Haiderans, Ravan- and the large group of tribes known under the generic appella- of Bohtan. 'Iraq comprises the core of Kurdistan proper: the es of the ancient kingdom of Shehrizor, such as Erbil, Kirkuk, aimaniya and the whole region of the two Zab rivers, as well as the ient and famous tribes like the Babans, the Hamavends, Jaffs the historic Bahdinan. Persian Kurdistan consists of the two *yats* (governments) of Luristan and Ardelan, and contains the khtiaris, the Lurs, the Kalhoris, the Ardelanis and their numerous -divisions. Between the lakes of Urmia and Van are scattered great tribes of Shikaks, Jallalis, the Hartoshis, the Mukris and ers. This division of the Kurdish race under three sovereignties kely to retard the growth of the Kurdish people into a homo- eous community, and may result in disastrous consequences for r future.

he Kurds before the War.—From an administrative point of w the Kurds of Persia since 1911 have undergone little change. Young Turk revolution 1908, however, gave new opportu- es to the masses of the Kurdish people. With the fall of dul Hamid were also suppressed the privileges of the so-called rdish Hamidiye Cavalry, which since 1890 had been a scourge scriminately for the peaceful Kurdish and Armenian peas- s. The suppression of the Hamidian régime brought forward e constructive and enlightened elements of the Kurdish ple, and several Kurdish deputies in the Turkish Chamber the Senate took up the cause of their nationality. Kurdish spapers and party clubs were established in Constantinople, hdād and Mōsul to cultivate a common language for the use ll Kurds. This nationalist movement was ably conducted by great Kurdish leaders, Sheikh 'Abdul Kader, a senator (hanged in Aug. 1925 by the Turks) and Baban Zadé Ismail Hakki.

Concurrently with this ensued war between the Young Turks and several Kurdish tribal chiefs. The former met strong opposition in 1909–12 in their attempt to repress those Kurdish chiefs who were favoured by the fallen Sultan. The Young Turks waged regular war against Ibrahim Pasha of the Millis, the Sheikh Barzani near Mōsul, the Hamavends and the tribes of Dersim. In spite of this warfare in particular areas, the tribes and the settled people greatly benefited by the general prosperity which resulted from greater liberty allowed under the Young Turk régime. As a result of the Turkish defeat in the Balkans, Sheikh Said 'Ali, of Khizan (southeast of Bitlis) rebelled in 1913. But he was soon captured and hanged.

The Kurds in the War.—None of the Kurdish tribes had any interest in the World War; yet from the beginning they were involved both on the Caucasian and the Mesopotamian fronts. Most of their manhood was killed in the War, and whole tribes suffered terrible losses owing to forced retreats and the consequent evils.

Kurdistan in the Peace Treaties.—At the Peace conference in Paris in 1919, Sherif Pasha, a Kurd, presented the claims of the Kurdish race demanding independence from Turkey. In the Treaty of Sèvres, Kurdistan was defined as a narrow strip of territory lying between the southern frontier of Armenia and northern 'Iraq. The Treaty of Lausanne did not mention Kurdistan. It left the delimitations of the northern boundary of 'Iraq to a friendly agreement between Great Britain and Turkey; failing this, the dispute was to be solved by the Council of the League of Nations (*see* MOSUL).

While the Council of the League was discussing this essentially Kurdish problem, a Kurdish rebellion broke out in Turkey in Feb. 1925, having Ginj and other middle Taurus heights as its centre. A Sheikh Said, followed by some well-known tribal chiefs, had some initial successes. The Turks collected regular troops, and after some short and decisive assaults broke the Kurdish rebellion and captured the Kurdish ringleaders. It was noted at the time that the powerful tribes of Bohtan, of Sasun and of Armenia in general did not rise in any way. A Turkish court-martial was set up at Diarbekr, which condemned to death Sheikh Said, Dr. Fuad, and 46 other Kurdish Nationalist leaders. They were all executed in Aug. 1925. The Kurdish leaders died with the independence of Kurdistan on their lips. The president of the Turkish court-martial stated later that the Kurdish rebellion had a purely nationalist motive.

KUROKI, ITEI, COUNT (1844–1923), Japanese general (*see* 15.952), was put on the reserve list in 1909 and died in Tokyo Feb. 4 1923.

KUROPATKIN, ALEXEI NIKOLAIEVICH (1848–1921), Russian general (*see* 15.952), died at the village of Shemshurino in the Pskov district on or about Feb. 10 1921.

KUT, SIEGE OF: *see* MESOPOTAMIA, OPERATIONS IN.

LABOR, DEPARTMENT OF (*see* 16.25).—The U.S. Department of Labor is the outgrowth of an agitation that began shortly after the Civil War, when Federal recognition of interests and rights of the great group of wage-earners was first sought. This agitation resulted in the creation of a Bureau of Labor in the Department of the Interior in 1884. In 1888 this bureau was enlarged and made an independent establishment of the Government, with its head reporting directly to the President. In 1903, under the administration of President Roosevelt, the Department of Commerce and Labor was created, and the Bureau of Labor was transferred to this new department. Continued demand that the wage-earners be represented in the President's Cabinet led to the law of 1913 creating the present Department of Labor and transferring to it the Bureau of Labor (now the Bureau of Labor Statistics), the Children's Bureau and the Bureau of Immigration and Naturalisation. By the terms of this organic law, "The purpose of the Department of Labor shall be to promote, foster and develop the welfare of the wage-earners of the United States, to improve their working conditions and to advance their opportunities for profitable employment." The law also gave the Secretary of Labor authority to conciliate industrial disputes submitted to him for settlement, and this conciliation service has become one of the major functions of the department.

At the end of the World War the Women's Bureau and the U.S. Employment Service were taken over as normal and necessary adjuncts to the department, and built up from skeleton organisations left from work in the War. Of the strictly war services only the Bureau of Industrial Housing and Transportation remains, to dispose of the vast amount of property which it acquired for the convenience of workers and for the acceleration of production during the War. The Department of Labor as constituted in 1926, therefore, includes the bureaux of immigration, naturalisation, labour statistics, conciliation, women and children, whose titles sufficiently indicate their scope. (J. J. D.)

LABORI, FERNAND (1860–1917), French lawyer, was born at Reims April 18 1860. Educated at Reims and Paris, he spent several years in England and Germany. He was called to the bar in 1884, and rapidly made a reputation as a brilliant lawyer and advocate, being counsel for the defence in most of the important political trials of the day during a period of nearly 30 years. It was his conduct of the Dreyfus case, however, which placed him at the top of his profession and earned him his unique reputation. He fought with unremitting energy for his client during both the first and second revisions of the trial, in 1898 and 1899, a task attended with considerable danger, as political passions were so strongly excited at the time that Labori was shot at and wounded at Rennes on the eve of his cross-examination of the witnesses for the prosecution. Dreyfus was not finally declared innocent until 1906, and Labori never once relaxed his efforts on behalf of the unfortunate officer. Other notable trials in which he was concerned were the prosecution of Émil Zola for libel (1898) which arose out of the Dreyfus case; the Humbert affair (1902); and the trial of Madame Caillaux for the murder of M. Calmette, editor of *Le Figaro* (1914), when he secured her acquittal. He died in Paris March 14 1917.

LABOUCHÈRE, HENRY DU PRÉ (1831–1912), British politician, was born in London Nov. 9 1831. He was educated at Eton, and, after spending a short time at Trinity College, Cambridge, entered the diplomatic service in 1854, becoming in 1863 second secretary to the British embassy at Constantinople. In 1864 he abandoned diplomacy for politics, and in 1866 was elected Liberal member for Windsor, but was unseated on petition. In 1867 he won a by-election for Middlesex, but failed to be re-elected in 1868. In 1880 he again entered the House of Commons as Radical member for Northampton, and this seat he retained until his retirement in 1906. He began his journalistic career with *The Daily News*, of which he became part proprietor just before the Franco-German War. In 1874 he becam
associated with Edmund Yates on *The World* (*see* 28.908); bu
three years later he started *Truth* which had a remarkable recor
in the exposure of shams and organised impostures, especiall
frauds on the charitable. Labouchère was a strenuous advocat
of the abolition of the House of Lords (*see* 20.845, 846); at th
time of the Parnell Commission he had much to do with th
unmasking of Pigott; and he was a member of the inquiry int
the Jameson Raid, his hostility to Mr. Chamberlain being a
pronounced as against Lord Rosebery when the latter becam
leader of the Liberal party. After 1903 he lived mainly in Italy
at a villa near Florence, where he died Jan. 15 1912. See A. I
Thorold, *Life of Henry Labouchère* (1913).

LABOUR: *see* HOURS OF LABOUR; INTERNATIONAL LABOUR O
GANISATION; INDUSTRIAL RELATIONS; STRIKES; etc.

LABOUR, MINISTRY OF.—This department of the Britis
Govt. was set up in 1916 to deal with the increasing amount
administrative work caused by the extended activities of th
state. It took over certain duties from the Board of Trade an
also the administration of the national health insurance scheme
hitherto under the Treasury. The Ministry looks after mos
matters affecting the welfare of the wage-earners, includin
unemployment insurance, although the inspection of factorie
and workshops remains under the Home Office. It is also th
authority for dealing with industrial disputes. The Minister
Labour is the head of the department: his chief assistants a
the parliamentary secretary, like himself a politician, and th
permanent secretary, who is a civil servant. The head offices
the Ministry are at Montagu House, Whitehall, S.W.1. Some
the self-governing states of the British Empire have a publi
department charged with similar duties, and known as the Mi
istry of Labour.

LABOUR PARTY (*see* 16.28).—The year 1910 found the Labou
party in Great Britain marking time. In Parliament it w
hampered by the conflict between the two Houses; within i
self the Osborne decision (1908), that trade unions could n
legitimately subscribe money to political objects, had create
financial difficulties which had not been got over. In t
election of Jan. 1910 it ran 98 candidates, returned 40 and su
fered a net loss of five seats; in the Dec. election, of the sa
year, owing to financial stringency, it ran only 56 candidat
but returned 42. At the beginning of the year it polled a tot
of 505,690 votes; at the end 370,802. From 1911 till the ou
break of the World War in 1914 the parliamentary emba
rassments of the party continued. Pledged to Home Rule f
Ireland, the provisions of the Parliament Act compelled it
keep the Liberal Govt. in office. and deprived it of comple
freedom of action.

Industrially, the position was not good. The history of t
Labour movement is marked by decided swings backwards a
forwards, between a trust in industrial and in political actio
Between 1906 and 1910, the swing was towards politics; betwee
1911 and the outbreak of the World War it was towards indu
trial, or, as it is called, direct action. Trade union me
bership was on the increase; industry, especially railways a
coal-mining, was disturbed; the Osborne judgment drove acti
trade unionists on to the left as the political road seemed to
barred; trade-union action, as regards this Labour demand a
that, gave swift and decisive results that justified the impatie
mood of the time, whilst political action seemed to be impote
and slow.

Rise of the Syndicalists.—Moreover, in France and Americ
the new school of syndicalists had arisen. Its doctrines we
laid down in the former country by G. Sorel in his *Reflections s*
la Violence (1912), and elaborated in a series of books and pa
phlets written by members of the *Confédération Général d*
Travail; in the latter country De Leon, as a disciple of Ma
preached a similar doctrine, and the Industrial Workers of t

orld, a rival to the American Federation of Labor, was
unded to enforce it. The influence of these doctrines was felt
Great Britain. Several new socialist societies were started
om splits in the existing ones, like the Socialist party of Great
ritain and the Socialist Labour party, and though their
embership never reached more than 100 or 200, their virulent
d virile criticisms had some effect in spreading discontent
nongst sections of the Labour party. This was reflected in the
erature of the time, which consisted largely in defences of the
rliamentary position and of political as against direct action.
oking back upon those years, one really finds the beginnings
what later on has become known as Bolshevism. Upon this
ilosophy of the inevitable revolution the Russian Social
emocratic party split (1903) into the two schools which were
make history by the two revolutions of March and Nov. 1917.

Repeal of the Osborne Judgment.—At last, in 1913, the par-
mentary party succeeded in getting the Osborne judgment
pealed by the Trade Union Political Levy Act. To make
s possible the annual conference of 1911 had decided to
olish the pledge imposed upon all Labour members to act
ch the party and to be independent of other parties. This
litical success was an effective weapon against the syndicalists
d revolutionary trade unionists, and in the year preceding
e outbreak of war, the pendulum had begun to swing back
wards a belief in political action, and syndicalism had evidently
ne beyond its zenith. In addition to the Trade Union Act,
e party in Parliament had directed its attention (1911) to
ctoral reform, the women's suffrage agitation then being in
dence, a minimum wage, the feeding of necessitous school
ldren, and the government proposals for national health
urance. On the question of national insurance, the party
s much divided, and in the report which the parliamentary
mbers made to the annual conference the action of the recal-
rant minority was reported in terms of censure. In that
r (1911) payment of members was begun and a fund from
ich the party had made allowances to its members to meet
ne of their expenses was terminated. The year 1912 was one
ndustrial trouble and was marked by the passage of the Coal
nes (Minimum Wage) Act to end a coal strike—a historical
parture from which much in both government and trade
on policy dates.

The Party before the War.—The question of discipline within
party distracted its attention and reduced its efficiency, and
annual report for this year drew attention to the grave effect
t the action of certain members was having upon party
tunes. Nevertheless, by-elections showed a steady strength-
ng of the grip of the party in the country, the first approaches
a political understanding with the co-operators were made,
The Daily Citizen, the first Labour newspaper, appeared.
anwhile, the party had settled down to face seriously the
estion of organisation, and 1912 and 1913 show a great im-
vement in that respect. The first disappointment with
liamentary methods was still vocal, but was working itself
. The state of the country, owing to the Ulster agitation,
s overshadowing everything else. Civil war seemed to be
minent and preparations for it were being made. Obviously
eneral election had first of all to be held so as to get a vote
confidence for the Government's Home Rule policy. Over-
es were being made to ascertain how the party would stand
he conflict, and offers made to its leaders to join the Govern-
nt; but another cloud was hurrying up to blacken the whole
. The annual conference records are blank between Feb. 1914
Jan. 1916. The World War had come.

abour in the War.—The party hesitated. It had steadily
osed Sir Edward Grey's European policy, and it associated
lf at first with the neutrality committee. On Aug. 2 1914 it
olved to oppose Britain's entry into the War, but on Aug. 6,
a majority, it decided to make no statement when the first
credits were to be voted. Some of its leaders, including Mr.
nsay MacDonald, its chairman, resigned, and thenceforth
activities of the party were those of the nation. Through-
the War, however, it never ceased to discuss the best form of peace. It joined in an international conference of the socialist parties of the Allied countries in Feb. 1915, and issued a declaration of war aims; in May 1915 by a majority it joined the Coalition Govt.; in Jan. 1916 it was instructed by a special national conference to oppose conscription, and the Labour ministers resigned, but withdrew their resignation pending the annual conference which was about to meet. This condemned conscription, but refused by a narrow majority to ask for the repeal of the Act that had just been passed. The ministers remained. When in Dec. 1916 the new Coalition was formed, the party, by a majority, agreed to remain in it with added representation.

Meanwhile, the party was pursuing its discussion of peace terms, and in May 1917 decided to be represented at the abortive Stockholm Conference, to which delegates from the enemy states had been invited. This led to Mr. Henderson's severance from the Cabinet in August. The party was returning to its independence. At the annual conference held at Nottingham in Jan. 1918 a war-aims programme was agreed upon, in furtherance of a forward movement, and a new constitution making the enrolment of individual members possible was considered. Hitherto, the party had been a federation of socialist societies and trade unions; now, it proposed to form local labour parties in the constituencies, consisting of individual members as well as delegates from affiliated bodies. It also took a stand against Bolshevism and in favour of constitutional democracy. At a special national conference held in London in June, the declaration of the policy and principles of the party known as the new social order was launched, the truce had been broken in the Salford by-election won by Labour (Nov. 2 1917), and in Nov. 1918 the party withdrew its ministers from the Govt., and once more stood independent.

Labour in Office.—After the election that followed in Dec., the party strength was only 57, though its poll was increased to 2,244,945. A capital levy was advocated in 1920, and by 1922 the question of unemployment again came to the front. By-elections were encouraging and by the end of the Parliament the Labour party numbered 75 members. The election of Nov. 1922 brought up the number to 142 and Labour became the official opposition. Its vote in the country had increased to 4,236,733. In Dec. 1923 another election was held, and 191 Labour members were elected and the party vote increased to 4,348,379. The Govt., though in a minority, decided to meet Parliament. When it did so, in Jan. 1924, it was defeated by 328 votes to 256 and thereupon the first Labour Govt. in this country was formed with Mr. Ramsay MacDonald as Prime Minister. The Govt. could rely upon the support of less than one-third of the House of Commons and legislation was difficult. It directed its attention to unemployment, housing and to the preparation of national schemes for internal development. It had also to face a dangerous development in the Irish boundary problem and take legislative action to enable it to set up the Irish Boundary Commission.

Its foreign policy was devised to secure international co-operation and to pacify Europe, and it was successful in settling outstanding reparation difficulties at the London Conference (Aug. 1924) and was responsible for the protocol which was drafted at the Assembly of the League of Nations that year. It was also bent upon creating good diplomatic relations with Russia, for both economic and political reasons, and negotiated two treaties which were not ratified by its successor. The Govt. was defeated (Oct. 8) on its handling of a Communist prosecution, but really fell on its Russian policy. When the election came next month, the eleventh-hour publication of a letter, known as the Zinovieff letter, had considerable effect on the results, and, though the party vote increased to 5,551,549, its members fell to 151. The Govt. at once resigned and the party became the official Opposition. (J. R. M.)

LABRADOR (*see* 16.28).—By the end of 1925 considerable progress had been made by the agents of Canada and Newfoundland with the proposed case for submission to the Privy Council for its decision as to the boundary between the areas claimed by the two Dominions. Newfoundland claimed broadly, that her jurisdiction should embrace the whole watershed draining into the Atlantic, while Canada contended that a strip of seaboard a mile deep from high water is all Newfoundland should have. The territory in dispute contains the famous "Grand Falls" of Labrador, one of the greatest waterfalls in the world, besides several minor cascades capable of producing vast hydro-electric energy, while in the river valleys are large areas of forest growth capable of being converted into pulp and paper, so that the potential value of the region is very great. The population of Newfoundland Labrador at the census of 1921 was 3,774: this showed roughly a 10% decrease since 1911, mainly among the Esquimaux population in the Northern section, who were decimated by the epidemic of influenza in the winter of 1918–9. These natives do not exceed 1,000 in all, a decline of about one-half in some 35 years.

Lumbering, which in the period 1900–10 was undertaken in Hamilton Inlet, virtually ceased, largely because of difficulties arising out of the boundary dispute. The missionaries in the north, the Hudson Bay and Revillon Fur Companies further south and Newfoundland traders all over the region conduct its limited commerce. The Grenfell Mission pursues its humane activities among both transient fisherfolk and permanent settlers, and the Churches in Newfoundland, both Protestant and Catholic, maintain missionaries there in the summer, with one or two residing permanently. The hinterland is unpeopled save by some wandering tribes of Indians, who number only a few hundreds altogether, and are slowly dying out. Industrial conditions continue unchanged and the annual value of fish, furs and other articles exported from the coast to foreign markets averages about $500,000. Codfish to the value of about $1,000,000 a year is taken on the coast, brought to Newfoundland to be cured, and figures in the exports from that country.

BIBLIOGRAPHY.—W. T. Grenfell, *Vikings of Today* (1898); W. T. Grenfell, *Labrador* (1922); W. G. Gosling, *Labrador, its Discovery, Exploration and Development* (1910). (P. T. M.)

LACROSSE (*see* 16.54).—Lacrosse still has its stronghold in Canada, where it is looked upon as the national game. The number of amateur clubs to-day in the Dominion is approximately 1,465, as against 950 in pre-War days, but the professional game is practically dead, only three or four clubs having survived. Ontario is perhaps the chief centre, but Quebec, Manitoba, Saskatchewan, Alberta and British Columbia are all strong supporters. In the United States lacrosse is advancing more rapidly than in any other part of the world. The country has over one hundred teams, including many of the large universities and colleges, and the United States Military and Naval academies, whilst in California and elsewhere the game has taken a strong hold in the women's colleges. In Australia lacrosse is making headway, especially round Melbourne, Sydney and Perth.

The Game in England.—In England the game was increasing in popularity up to the outbreak of the World War, when all the clubs were depleted and disbanded. Players in the north of England, chiefly grouped round Manchester and Yorkshire, have always been far more numerous and generally more expert than in the south, where the game is centred round London and Bristol. It is also played at Oxford and Cambridge. In Ireland there has been no serious attempt to revive the game, which once had a good following round Belfast. In 1912 teams from Manchester and London played exhibition matches in Brussels and Ostend, and in 1913 similar teams visited Paris and Stockholm. Preliminary plans were on foot for a visit of a representative English team to tour Canada in 1914, but the World War put an end to the plan. Lacrosse, as played by ladies, has made great strides since the War, and ladies' clubs are numerous. It is largely played in girls' schools all over the country. The laws have been modified to suit the requirements of ladies, and inter-county and territorial matches are annual events. (C. O. L.)

LADD, GEORGE TRUMBULL (1842–1921), American philosopher (*see* 16.59), died at New Haven, Conn., Aug. 8 1921.

LAERMANS, EUGÈNE (1864–), Belgian painter, was born at Molenbeek St. Jean (Brabant) Oct. 22 1864. Deaf and dumb from birth, but gifted with a keen intelligence, he developed his talent in almost total isolation. He devoted himself t painting scenes of humble life, and might be considered a moder Pierre Brueghel the Elder. He has adopted, in place of the passive objectivity or dark humour of the old masters, a libera sympathy similar to that found in the works of Charles Degrou or Constantin Meunier, but which Laermans has interpreted in different manner, with feeling and power inspired by the injustice and inherent misery of an ill-organised social state Denied the usual channels of expression, he expresses, throug the medium of form and colour, his pessimistic view of life This pessimism is not only illustrated by his choice of subjec but also by the design and colour schemes which lend individuality to his work. Notwithstanding the rare harmonies of colou found in the work of M. Laermans which show him to be a master of technique as well as a painter, the artistic value woul appear subservient to its moral significance. This artist, alread deaf and dumb, was further unfortunate in the loss of his sight His works may be seen in the Luxembourg, Paris, and at Venice Brussels, Antwerp, Ghent, Liége and other places. (P. L.)

LA FOLLETTE, ROBERT MARION (1855–1925), America politician, was born on a farm in Primrose township, Dane co. Wis., June 14 1855. He graduated from the University of Wisconsin in 1879, studied law there for one term, and was admitte to the bar in 1880. He began immediately to practise in Madison and served as district attorney for Dane co. for two term (1880–4). From 1885 to 1891 he was a representative in Congress, and, as a member of the Ways and Means Committe helped to draft the McKinley Tariff bill. On being defeated fo Congress in 1891 he returned to practise in Madison. In 189 he was a delegate to the Republican National Convention. H was elected governor of Wisconsin in 1901 and was re-elected i 1903 and 1905. It was largely due to him that state laws wer passed for taxing railways according to valuation (1903), fo nominating all candidates for public office by direct vote of th people (1904) and for regulating the railways in the stat through a state commission (1905). He resigned the governorship in 1905 on being elected to the U. S. Senate, and wa reelected for three succeeding terms.

Mr. La Follette was an unsuccessful candidate for the presidential nomination at the Republican National Convention i 1908. In 1915 he was sponsor in the Senate for the Seamen' bill providing for better working conditions and increase of life saving equipment on board ship. He favoured, in 1916, a embargo on the shipment of arms from America, but supporte armed intervention in Mexico. After America's entrance int the World War he was a pronounced pacificist. The Republica National Convention held at Cleveland, O., in June 1924 rejected a platform presented on behalf of Senator La Follett by the Wisconsin delegation, and he received only 34 votes o being placed in nomination for President. Accordingly a Convention for Progressive Political Action was convened at Cleveland on July 4, at which, following a letter from La Follett denouncing both the Republican and Democratic parties, he was endorsed as a presidential candidate. He selected the nam "Progressive" for his party, and his platform included advocac of public ownership of water power and railways, strict publi control of all national resources, a recognition of agriculture a the basic industry of the country and abrogation of the powe of the Supreme Court to nullify legislation. During the electio campaign the American Federation of Labour agreed to suppor him. In the ensuing election he was beaten by both Republica and Democratic candidates, his electoral vote being 34, a against 382 for Coolidge and 136 for Davis, the popular vot being 4,686,681 for La Follette, 15,748,356 for Coolidge an 8,617,454, for Davis. His own state, Wisconsin, was the only one to give him a majority. He died at Washington, D.C. June 18 1925.

His son ROBERT M. LA FOLLETTE, who was born in Madison Wis., Feb. 6 1895, was elected by a large plurality Sept. 29 1925 to fill the unexpired term of his father's senatorship. He stood as a supporter of his father's platform of 1924.

AGERLÖF, SELMA (1858–), Swedish author, was born 20 1858 at Mårbacke in Vermland where she grew up in a vince rich in local tradition, and became a teacher in Landsa. In a literary competition in a weekly paper she won highest prize for some chapters of her first work *Gösta Bers Saga* (Eng. tr. 1898), which was published in two volumes in and attracted great attention. The book is a collection of ies of Vermland life in the year 1830, related with vivid imagi-on and lyric style. In 1894 she published *Osynliga Länkar* (In-ble Links) and from 1895 onwards was able to devote herself rely to writing. After visiting Italy for the purpose of ex-ling her studies, she published in 1897 *Antikrists Mirakler* g. tr. 1898) depicting life in Sicily. In 1899 appeared *Drott-ar i Kungahälla* (Eng. tr. 1917), historical legends, as well *En Herrgårdssägen* (Eng. tr., *The Legend of the Manor*, 1922). r a journey to Palestine and the East in 1900 she published *salem*, 2 vol. (1901–2, Eng. tr. 1903), describing a religious ement in the Swedish province of Dalarne, which led to an gration to Palestine. She also wrote *Kristuslegender* (1904); *Holgerssons underbara resa*, 2 vol. (1906–7, Eng. tr. 1908), ook for children; *Liljecronas Hern* (1911, Eng. tr. 1913); *karlen* (1912); *Dunungen* (1914), a dramatised novel; *Kej-n af Portugalien* (1914, Eng. tr. 1916); *Troll och Manniskor* *mons and Men*), 2 vol. (1915, 1921) and *Charlotte Löfvens-* (1925). In 1909 she won the Nobel Prize for literature, and 914 was elected the first woman member of the Swedish demy. Most of her books have been translated into English many other languages.

e J. Mortensen, *Literary Biography* (1908); André Bellesort, *uède* (1910); also works with title *Selma Lagerlöf* by O. I. Lever-1904); M. Jepson (1913); M. Kristensen (1917).

AGOS (*see* 16.74), the principal port and capital of the British ny and protectorate of Nigeria, West Africa. The popula-, including Iddo and Apapa, is 99,690 natives and about 1,000 es (1921). The town is built on an island in a large lagoon is reached from the Bight of Benin over a shifting sand bar. es protect the entrance to the harbour and vessels drawing . can enter it. Lagos is linked to Iddo Island, on which the inus of the railway to Kano is situated, by Carter bridge, Iddo in its turn is joined to the mainland by Denton bridge. customs wharf at Lagos is 1,183 ft. long and vessels of 22 ft. ght can lie alongside. At Iddo is a wharf 860 ft. long, draught eet. At Apapa, on the mainland, facing Lagos town, a wharf ft. long, under construction in 1924, was designed to take els drawing 26 ft., to which depth the bar was being dredged. re are several smaller wharfs and floating docks. By the drain-of swamps much has been done to improve sanitary condi-s. The town has fine public and commercial buildings and le water and electric light supplies. Some 25% of the inhab-ts are Christians and 53% Moslems. Lagos has been since the seat of an Anglican bishopric. In April 1925 the Prince Vales laid the foundation stone of the cathedral. The port s all the trade of Nigeria served by the railway to Kano r 700 m. long) and has a considerable canoe-borne trade the neighbouring regions. The former colony of Lagos is part of Nigeria. See *The Nigerian Handbook* (Lagos,).

AGUERRE, JEAN HENRI GEORGES (1858–1912), French er and politician (*see* 16.79), died June 17 1912.

AHORE, India (*see* 16.81), the capital of the Punjab, India, a centre for agricultural produce, is of little importance strially, except for the works of the North-Western Railway. population was 281,781 in 1921. The Dyal Singh College, enominational and affiliated to Calcutta University, was ded in 1910, and the Sanatan Dharma College in 1916. tern towers were added to the Cathedral Church of the rrection in 1913. An iron bridge over the Ravi was opened 915. In 1824 the old fort was taken over by the police, and a fort built by the military.

AIDONER, JOHAN (1884–), Estonian soldier, was born he Viljandi district. He completed his military studies e Vilna military school and the Nikolai military academy in St. Petersburg (Leningrad). On the outbreak of the World War, he was a staff officer on the Caucasian front, and in 1915 became divisional chief of the staff of the Russian Western Front. In 1917 he was promoted lieutenant-colonel in command of the Caucasian Grenadier Division and then chief of staff to the 62nd Division. On the formation of the Estonian National Army he was appointed to command the first Estonian Division. During the period of German occupation (1918) he negotiated with Soviet Russia concerning the prevention of the annexation of Estonia by Germany. He also organised from St. Petersburg the transport of the Estonian Army, via Archangel and Murmansk, to the Allied front. At the beginning of the Estonian War of Independence, (1918–9), Laidoner was appointed commander-in-chief of the Estonian Army; at the same time he became by arrangement leader of the Russian Northern Army until the latter reached Russian territory, when Yudenich took over the leadership. He conducted the operations with both military skill and political ability. On the conclusion of the War he left the army and entered politics, being elected representative of the Agrarian party in the first and second Riigikogu. He became president of the commission for foreign affairs and state defence of the Riigikogu, and Estonian delegate to the League of Nations. In 1925 he presided over the League of Nations Commission appointed to inquire into the Mosul frontier dispute between Great Britain and Turkey. (*See* ESTONIA.)

LAISANT, CHARLES ANNE (1841–1920), French politician (*see* 16.84), died at Asnières, near Paris, May 5 1920.

LAMMASCH, HEINRICH (1853–1920), Austrian jurist, was born at Seitenstetten, Lower Austria, May 21 1853. He was appointed professor at the University of Vienna in 1889, became eminent as a teacher of criminal and international law and his publications on these subjects deeply influenced their practice. Four times a member of the International Court of Arbitration at the Hague, being president three times, he helped to settle, among other cases, the dispute between Great Britain and America on the fishery rights off the North Coast of America in 1910. He was, perhaps, the most prominent Austrian pacifist during the World War and, as such, while incurring bitter hostility in the Austrian Herrenhaus, to which he had belonged since 1899, he inspired confidence elsewhere, and was chosen to preside over the final ministry which liquidated the central administration of the older Austria (Oct. 26–Nov. 13 1918). He published in 1919 *Der Völkerbund* and *Europas elfte Stunde*. Lammasch died at Salzburg Jan. 6 1920.

LAMONT, THOMAS WILLIAM (1870–), American banker, was born at Claverack, N.Y., Sept. 30 1870. He was educated at Phillips Academy, Exeter, N.H., and at Harvard where he graduated in 1892. He was for two years with the New York *Tribune*, and then for some time actively engaged in business. From 1903 to 1909 he was with the Bankers Trust Co. in New York, as secretary and treasurer and, after 1905, as vice-president. In 1909 he was elected vice-president of the First National Bank of New York City, serving for two years. On Jan. 1 1911 he entered the firm of J. P. Morgan and Co. He was active in raising additional endowment for the Harvard School of Business Administration. He took part in floating the British, French and Russian loans in America during the World War and from 1918–22 he was proprietor of the New York *Evening Post*. In 1919 he was financial and economic advisor of the American delegation to the Peace Conference in Paris. He was U.S. delegate on the international consortium for assisting Chinese industries and railways, and visited China as the representative of the American group. In 1921 he became chairman of the American committee for the China Famine Fund, and was chairman of the international committee of bankers which handled the question of the Mexican foreign debt.

LANCIANI, RODOLFO AMADEO (1846–), Italian archaeologist, was born in Rome Jan. 1 1846. He was educated in that city and in 1872 became secretary of the archaeological commission. In 1878 he was appointed director of excavations and professor of ancient topography in the University of Rome. Lanciani devoted his life to the study of the antiquities of ancient Rome, while by no means neglecting those of the Middle Ages; and in both fields he came to be recognised as a leading authority. He made important discoveries in the House of the Vestals, the Basilica Julia, the imperial palace on the Palatine, the baths of Caracalla, the temple of Jupiter Capitolinus, Ostia, Trajan's harbour at Porto and Hadrian's villa below Tivoli. He also worked with the minister, Guido Baccelli, to create the Passeggiata Archeologica, arranged the collections in the Antiquarium and organised the classical side of the Rome exhibition of 1911. In 1911 he was created a senator.

He wrote a great number of works on archaeological subjects in Italian and English of which the most important are: *Ancient Rome in the Light of Recent Discoveries* (1888); *Pagan and Christian Rome* (1892); *The Ruins and Excavations of Ancient Rome* (1897); *Destruction of Ancient Rome* (1899); *New Tales of Old Rome* (1901); *Storia degli Scavi e Musei di Roma* (1902); *Wanderings in the Campagna* (1909); *Ancient and Modern Rome* (1925).

LAND LAWS: *see* PROPERTY, LAW OF.

LAND TENURE (*see* 16.155).—There are in the course of recent history two outstanding and epoch-making events each of which was of great moment in bringing about far-reaching changes in existing conditions of rural tenure: the French and the Russian revolutions. The one has already receded into historic perspective, the second is an actual fact of to-day. The former broke up the feudal land system and did away with the obligations attaching to property in land, with the result that agricultural development became involved in a capitalist economy; the Russian revolution, while abolishing private property in land, swept away the capitalist agrarian conditions which had grown up during the 19th century. The land was nationalised, and the state gave the full use of the land to all who were prepared to cultivate it with their own labour.

Just as the ideas of the French revolution influenced the whole of European agrarian legislation, so the influence of the Russian revolution was felt throughout eastern Europe—that is, in the countries on the borders of Russia, all of which are agricultural countries in the fullest sense. Thus agrarian reform was undertaken by a whole series of states; and, speaking generally, the more closely the states followed the Russian agrarian revolution, the more radical were their reforms, both in principle and in practice. Estonia and Latvia came nearest in this respect, while the model was least closely followed by Finland, Austria and Germany. Between these two groups there lies a whole gamut of variously devised agrarian reforms. The objects of all reform schemes were: by means of a transformation of the existing conditions of land tenure to create a peasantry which is socially and economically sound; and to retain in the country the numbers of peasants who would otherwise emigrate, and thereby to identify them more and more closely with the homeland itself. In the realisation of these aims the War acted as an accelerating and releasing force.

I. THE JURIDICAL BASES OF LAND REFORMS

The juridical bases for the accomplishment of the agrarian reforms are to be found in the agrarian laws of different states.

If the land hunger of the population is to be satisfied—whether by the formation of new holdings, or by the apportionment of additional land to small peasant holdings already existing, or even by assignment of parcels of land to the land workers—a land fund of corresponding extent is obviously a first essential. This was usually achieved by devoting the state lands and the public land to the purpose, and, in varying degrees, by the expropriation of the large estates.

Russia.—A complete expropriation of rural land ownership in favour of the state, acting on behalf of the peasant, has been carried through only in Russia. The first so-called Land Decree of Nov. 8 1917 ordered the expropriation, without exception, of all the landed property of the large landowners, of all lands formerly the appanage of the Crown, and of monastic and Church lands. In the agrarian legislation of subsequent years this fundamental principle was retained (*see* RUSSIA). Some 40,000,000 desiatines in all (not including Siberia) were thus transferred from private large landowners to the peasantry as a whole. A similar solution by expropriation was originally enacted Estonia by the law of Oct. 10 1919. On May 15 1925, howev the Assembly amended this enactment by permitting 50 he tares of land to be restored in usufruct to the original owne In all an area of 2,147,100 desiatines—97% of the area held large estates—was expropriated in Estonia.

Latvia and Lithuania.—Partial expropriation was carried o in certain countries. In Latvia, by the law of Sept. 24 1920, t state land fund was formed of the state domains and forests, a to a limited extent by the expropriation of large estates. On average 50 hectares of land was restored to the original owne After the expropriation the total state property in land amount to 3,700,000 hectares. In Lithuania the law of Feb. 15 1922 e acted that state lands be appropriated, and that landed propert belonging to the former Russian Nobles' and Peasants' Agr cultural Banks, ecclesiastical lands and lands of private owne in excess of 80 hectares in any case, be expropriated. Owne of not more than 150 hectares farming their own lands we expropriated only after the division of the large estates.

Balkan Countries.—In Rumania the law of Dec. 14 1918, lat somewhat modified for the newly acquired territories, contem plated the entire expropriation of crown lands, the estates charitable societies, of absentees and foreigners and the esta lishment of a land fund of 2,000,000 hectares by partial expropriation of the private large landowners of over 100 hectare the size of the expropriation shares increasing as the areas to expropriated became larger.

In Bulgaria, according to the law of May 10 1921, the stat land fund is formed, *inter alia*, by expropriation of private e tates, leaving, however, 30 hectares to the owner when he work the land himself. In the case of non-cultivation by the owne four hectares only are restored to the owner, or 10 hectares f the whole family; under the extending law of July 21 1924 family with more than five members is allowed five hectare per member.

In Yugoslavia the decree of Feb. 25 1919 orders that the en tire landed property, including entails and estates with from 5 to 280 hectares of cultivable ground, be expropriated, providin about 1,100,000, hectares for distribution. In the autumn 1925 a new legislative project was laid before the Skupshtina which was intended finally to settle the question of the expropriation of the large estates. In Greece the agrarian laws 1920–2 provide for an expropriation of properties of over 10 hectares. According to a recommendation of the Ministry Agriculture dated Feb. 11 1925, land is to be restored, distric by district, to the extent of from 300 to 500 hectares. Cultivation is compulsory on pain of fresh liability to expropriation The process of obtaining land in Austria may be ranked as expropriation rather on formal grounds than in actual fact, sinc the expropriation does not press at all harshly and is not to an perceptible extent prejudicial to the tenure of large propert The object of the resettlement laws of 1919 and 1921 was th resumption of cultivation of farms which the large holders, mor particularly the owners of forest land, had devoted to purpose of sport or luxury. In such cases land which had been farme land at any period since 1870 may be expropriated on the deman of a qualified applicant.

Czechoslovakia.—The agrarian legislation of Czechoslovaki followed a middle course. In Czechoslovakia, by a law of Apr 16 1919, the State Land Office is empowered in the first instanc to impose certain restrictions on the property rights of larg land-owners; by the law of April 8 1920 the state must give a least six months' notice of expropriation to persons farming such land. Any area is regarded as a large estate on which there are more than 150 hectares of agricultural land, or which itself exceeds 250 hectares.

Poland.—In Poland, where the state merely regulates the conditions of tenure without forming a proper state land fund, the land reserve according to the Seim decree of July 10 1919, and the agrarian law of July 15 1920, is made up of the following categories of land: the state lands, the property of the former ruling dynasties, of the former Russian Peasants' Bank l of the former Prussian land settlement commission, mort- in lands, and also land acquired by forced sale of private prop- es which are more than 180 hectares in extent. In the indus- l and urban districts this limit may be reduced to 60 hectares, l in the west and east regions of Poland may be extended to hectares.

Jnder a law dated Dec. 28 1925 these limits may be ex- ded, by agreement between the Ministry of Agrarian Re- n and the Ministry of Agriculture, in the cases of large farms ich have a special importance in the economy of the country, h as farms with sugar factories, distilleries, etc., or farms ing employment to many workers, on condition, however, t the aggregate area in the whole country of the farms to ch this provision is applied shall not exceed 500,000 hectares. any case, before a forced sale the owner is given 30 days in ch to effect a voluntary sale of his parcel to the state. The a proposed for the land reserve is estimated at about 5,000,- to 6,000,000 hectares.

Iungary.—In Hungary the state has recourse to expropria- only when the required parcels of land are not to be ob- ned either by purchase in the open market or on the basis of gal right of pre-emption by the state, at the time of the aliena- of parcels. However, there may be expropriated, *inter alia*, perty to the extent of 100 cadastral *joch* (1 *joch*=0·575 hec-), which was bought during the War; such large estates as e changed hands in the way of sale since July 28 1864 and articular so much of each estate as still to allow the remaining tion to be brought under systematic cultivation. The area ing under the reform schemes is estimated at over 7,000,000 tares. For home colonisation in Finland there are available he first place, under the law of Nov. 25 1922 (Lex Kallio), state lands and the lands of public bodies, communities, rches, share companies, etc.; after these the property of rate owners is purchased in the open market, and only when t does not suffice, is the expropriation of estates of over 200 tares (in the north of over 400 hectares) carried out.

enerally speaking the percentage taken of the large property esponds to the number of complete hundreds of hectares uded in it; thus in the case of 200 hectares at least 2% is ropriated, and as a maximum 50% in the case of 5,000 hec- s and over. The lands illegally acquired by the timber com- ies were expropriated before any other lands.

ermany.—Finally, in Germany, under the National Settle- nt Law of Aug. 11 1919, state lands, heath and waste land already set aside for the provision of land for settlement in addition land acquired by the state right of pre-emption the occasion of large sales of private parcels of land. Only r this is recourse had to the expropriation of a part of the e estates. The Land Supply Unions (*Landlieferungsver- de*), the members of which are large landowners possessing r 100 hectares, are obliged to assign for settlement purposes east one-third of the total area of the large estates in the dis- t, or to reduce the cultivable area of the large estates to 10% he total agricultural area in the district. In this way over o,000 hectares of large landed property are to be expro- ted in Prussia in the coming years.

he methods of acquiring land are thus very various—com- e or partial expropriation with notice in advance, pre-emp- by the state on the occasion of alienation of property, pur- se in the open market—and each method is in its turn signifi- t of the spirit in which the land reforms were undertaken.

ompensation for Expropriation.—Very striking differences also found in assessing compensation for the expropriated tes, varying from the expropriation without compensation ussia to the payment of the full value of the land which ob- s in Germany. Latvia, following the precedent of Russia, ded not to give any compensation to the expropriated owners arge estates. In Estonia the question was still under discus- in 1926. In Lithuania compensation is reckoned on the is of the average prices of the years 1910–4. Owners who sess not more than 200 hectares receive the average market es at the time of the surrender of the land for areas under 150 hectares. Pre-War prices are also paid in Czechoslovakia with a corresponding reduction of the price in the case of estates of more than 1,000 hectares. In Rumania 40 years' rental is given for arable land and 20 years' rental for meadow land on expropriation; in no case, however, may the sum paid in compensation exceed the selling price of the year 1913. Compensation in Greece amounts to nearly 1·3 times the selling price. In Poland, as also in Bulgaria according to the law of 1924, half of the average local market price is fixed as the estimate of the compensation. In Yugoslavia, pending the final settlement of the question of compensation, a rent is paid to the expropriated owners up to the amount of the former net return. Payment of the average market price for the expropriated parcels has been established in Hungary, Finland and Austria, as in Germany.

Division of the Land Fund Among the Applicants.—In the distribution of the expropriated lands the principle of priority for ex-service men and their families runs through the whole agrarian legislation of the post-War period. In the states of western Europe measures were also taken for encouraging the settlement of ex-soldiers on the land, and legislation was passed with this object. In particular in England, according to a report of the Ministry of Agriculture ("Land Settlement in England and Wales, 1919 to 1924," London, 1925, p. 139) 16,461 ex-service men were, up to Dec. 31 1924, settled permanently, of whom 14,061 occupied 213,343 ac. of land. Much has been accomplished in this direction in France, Italy, Belgium and other countries.

The size of the peasant holdings newly brought into being is either determined according to an economic principle, or is fixed numerically. The former is the case in Russia, where the measure for land division is applied, sometimes in accordance with the farming system predominant in the different districts, sometimes according to the "work norm," *i.e.*, according to the sum of the work capacity of the family, or according to the "requirement norm," *i.e.*, according to the number of persons in the family. In Estonia, Bulgaria, Yugoslavia and in Finland, the size of the peasant holding is usually determined according to the "work norm," though sometimes also reaching the maximum numerical limit. In Germany the holdings must, according to the law, be of sufficient size to maintain a family. In the other states the average size of the holding is numerically fixed; thus in Latvia it is 22 hectares, in Lithuania from 8 to 20 hectares, in Poland not more than 15 hectares, in Czechoslovakia 6 to 10 or 15 hectares, in Rumania not more than 7 *joch*, in Hungary, 15 cadastral *joch*, and in Greece an average of 10 hectares.

Form of Management of the Farm Undertakings.—The most prevalent form of management of the new type of holdings in all the states is individual. In Russia 3% of the total area of the expropriated land was reserved for collectivist enterprises, 11% for the Soviet estates and 86% for individual holdings. The collectivist holdings have scarcely been able to maintain themselves, and since 1921 their number has fallen off. This seems the more remarkable, as a similar form of ownership was earlier familiar to the Russian peasant in the institution of the *mir*, although this juridical form was imposed on the peasants at the time of the freeing of the peasants in 1861 not on theoretical or socialistic grounds but rather for technical and fiscal reasons. Peasant enterprises managed co-operatively in very various forms are instituted under the agrarian reforms in Estonia, Latvia, in Czechoslovakia, Rumania, Hungary, Bulgaria and Greece. In the latter states the parcels expropriated by the Government are handed over to co-operative societies, which in their turn undertake the distribution of land to their members.

Legal Protection of New Peasant Holdings.—With a view to preventing any reversion, as the result of alienation, division, etc., to the former conditions of the apportionment of agricultural land, special measures have been included in the agrarian legislation of all countries, limiting the liberty of the peasants to dispose of the new holdings. In Russia, for instance, the land can be neither sold nor mortgaged nor given in free gift. It may not even be divided among the members of a family, unless the division leaves economic units of production. In Latvia a minimum limit of 10 hectares, and in Lithuania of 8 hectares, is fixed for the land parcels to be divided in the future. In Poland no parcelling of the newly formed holdings may take place, so long as they are burdened with a mortgage in respect of the unpaid balance of the purchase price, and in no case before the lapse of 25 years from their formation. Peasant holdings in Rumania may only be sold, divided, etc., after the lapse of 5 years from the definite conveyance of ownership. According to the extending law of March 1925, the state has the right of pre-emption in the case of alienation of peasant holdings, etc.

In retrospect it may be stated that in all the land reforms undertaken the endeavour is to modify the conditions of rural tenure within the limits of the existing land property rights. The principle of private property in the land as such is, as perhaps is clear from the expropriation legislation, not merely protected, but even placed upon a much wider basis and riveted more firmly into the general consciousness. In Russia alone not only are the conditions of land tenure reformed, but land tenure itself is subjected to a reform in the socialistic sense by a breaking down of the existing land rights. In the agrarian legislation of Estonia and Latvia some echoes of the theories of Henry George may be noted, and the land reforms in Finland, Austria and Germany rather bear the character of home colonisation.

II. THE RESULTS OF LAND REFORM

If the War, as has been said, acted as an accelerating force in the initiation of agrarian reforms, the period of their execution was very unfavourable from the economic standpoint. In the confusion prevailing in the whole after-War economy, the absence of capital and the depreciation of the currencies, and in view of the special interstate trade relations of the Central European countries, which tend towards an extreme protectionist policy and prevent any speedy re-establishment of the national economic policy in each case, the progress of the land reforms has been beset with difficulties. The distance in time from the introduction of the reforms is still too small to make it possible to pass a final judgment on the economic results of these important changes in land tenure. The results achieved cannot of course be looked upon exclusively as the consequence of the land reforms—*post hoc, ergo propter hoc*—but rather are regarded as the outcome of the whole development of agriculture in the separate countries. But the parallelism in the course of the two phenomena may be noted—the transformation of the conditions of tenure of agricultural land and the simultaneous increase in agricultural production.

Russia.—Virtually the whole of the large landed property was divided into nearly 20,000,000 peasant holdings. The first years of the revolution, during the period of militant communism, witnessed the gradual shrinkage of the area in cereal cultivation. Since the introduction of the new economic policy in 1921, and the publication of the Agrarian Code in 1922, cereal production has steadily increased, and, according to the data published by the International Institute of Agriculture at Rome in Dec. 1925, reached in 1925 the total of 180,000,000 quintals, as compared with an average of 205,000,000 quintals for the years 1909–13. The cereal export has also increased since 1922, and according to the original estimates of the Russian Central Statistical Office, in the commercial season 1925–6 to nearly 600,000,000 *poods, i.e.*, the equivalent of the pre-War annual grain export. In reality, the exports have been considerably lower than was anticipated, owing, amongst other reasons, to the deficiency in the country of industrial products serving either for the farms or for the household consumption of the peasants. The result of this deficiency is that the peasant withholds his grain from the market, and it cannot, therefore, be exported. However, as was remarked in the issue of Jan. 1926 of the *Bulletin de renseignement de l'Office commercial pour la Russie et les pays limitrophes*, published by the French Ministry of Commerce and Industry, "all the evidence confirms that the peasants had their barns well filled."

Baltic States

Estonia.—In Estonia the process of land reform is nearly accomplished. Of the 1,060,400 desiatines of land under cultivation belonging to the large landowners, 431,900 desiatines were already previously rented to small holders. The agricultural land thus available for the purpose of the land reform was 628,500 desiatines. According to official data 30,766 new farms have been established in the years 1919–24, and cover a total extent of 598,837 desiatines.[1] The number of families who have profited by the land reform is course, higher than the number of newly established farms, as larger parcel of land was often assigned to two or more famili Under the new conditions of the distribution of land the producti of flax for seed rose from 78,971 quintals in 1921 to 131,700 quint in 1925 (as compared with 164,126 in 1909–13), and the producti of flax as fibre from 67,202 to 148,100 (as compared with 169,171 1909–13). The export of linseed was 12,768 quintals in 1921 a 28,240 in 1924, and of flax fibre 52,280 and 104,328 quintals in t corresponding years. In both cases in the course of three years the is thus a 100 % rise. The export of butter has also advanced, amour ing to a value of about 2,000,000 marks in 1925 (or over 20 of the total exports), as compared with 1,000,000 marks in the pr vious year.[2]

Latvia.—In Latvia before the land reforms the estates of t nobles in Livonia embraced 463,449 hectares (32·3 % of private owned rural land), and in Courland, 533,689 hectares (30 %). 1924 more than half, viz., 61 % of the agricultural and forest land, h passed under state control, and approximately 50,000 new holdin had been established on such land.[3] The area cultivated in flax Latvia showed an even more rapid increase than in Estonia: fro 30,499 hectares in 1921 it rose to nearly 78,100 hectares in 1925, compared with an average of 69,619 hectares in the years 1909– In absolute figures, the export of flax, as seed, rose from 48,5 quintals in 1921 to 176,122 quintals in 1924, and the export of fl as fibre rose in the same period from 62,758 quintals to 204,4 quintals. In both cases accordingly the export has more tha trebled.

Lithuania.—In Lithuania 36 % of the agricultural area belong before the War to the large landowners, almost all of whom possess more than 2,000 hectares. There were 110,000 small holdings, b longing to 28 % of the agricultural population, which contained an average less than three hectares. Half a million persons, or fro 15 to 20 % of the agricultural population, were landless.[4] In th course of the land reform about 1,360,000 hectares, includin 400,000 hectares of agricultural land and 960,000 hectares of fores passed into the land reserve for the formation of small holdings. this connection also a rapid increase in the production per area is be noted. The flax growing area increased from 51,200 hectares 1922 to about 81,000 hectares in 1925, as compared with the avera area under cultivation of 55,167 hectares in the years 1909 to 191 and the production rose in the same period from 281,500 quintals linseed to nearly 486,600 quintals and from 205,000 to 421,5 quintals of fibre. A fair export trade is developing and amounts nearly half the total production in flax.

Finland.—In Finland, where in 1910 out of the total area 32,997,217 hectares not less than 91·4 % was forest, moorland, etc while the cultivated land only accounted for 5·7 %, and the meado land for only 2·9 %, the forest wealth is naturally the determinin element for the national economy. Of the total rural population 2,820,000 persons (84·2 % of the whole population of Finland), on 40·6 % are owners or tenant farmers and 59·4 % are agricultur workers of different kinds, who draw no assured subsistence from th land.[5] A systematic scheme of land settlement has been in progre since the beginning of the century. Up to Sept. 30 1925, by means grants from the land colonisation fund, 437,319 hectares were settle 11,845 new farms established, 4,078 small holdings enlarged an 6,000 sites for farm workers' dwellings granted.[6] The object post-War legislation has been to facilitate the transition of the tena cies into free ownership, as also the wider employment of land f settlement purposes; 43,343 small holdings were established betwee Oct. 25 1918, and March 1 1925. The wheat production of Finla has risen from 157,538 quintals in 1921 to 202,900 quintals in 192 and the export of butter from 64,652 quintals in 1921 to 131,910 1925; in 1913, 126,400.

Central European States

Poland.—Out of 1,000,400 peasant families in Galicia there we 813,000 who did not make an adequate living out of the land, whi 1,220,000 peasant inhabitants of Russian Poland owned no land all. Up to Jan. 1 1923, 271,197 hectares of land were available f land reform purposes, and 18,018 new farms were establishe 27,256 were enlarged, 3,199 workers' homesteads were erected an 360 special farms instituted.[7] An Agrarian Reform bill was pass in Dec. 1925, which provided for the distribution of 20,0 hectares a year among peasant farmers over a period of ten year the maximum areas tenable being 60 hectares in industrial areas, 3 acres in the border provinces, and 175 in other areas. Compensati to the owners was at the present value, from 25 to 50 per cent bei paid in cash, and the remainder in bonds.

Czechoslovakia.—In Czechoslovakia the land reform was practially complete in 1926. Before the War the great estates of over 500 ectares in extent absorbed altogether one-third of the total agriultural land. The land available for agrarian reform has been 229,688 hectares of arable and meadow land. Of this one-third emains in the hands of the large landowners, 80,000 hectares is left ith the former tenants under the form of tenancy, and 820,000 ectares are being apportioned into small and very small holdings. he number of farms of 2·5 hectares in extent has doubled, and that f farms of from 5 to 10 hectares has quadrupled, and the number f peasant farms of over 10 hectares has increased to a remarkable xtent.[1] The production of sugar-beet advanced from 40,716,551 uintals in 1921 to 84,083,300 quintals in 1925. The export of sugar eturned in 1921 as 376,328 metric tons, amounted in 1924 to 1,015,55 tons. The republic holds the first place among European sugarxporting countries and the third on the international sugar market.[2]

Hungary.—In Hungary before the land reform large estates of ver 1,000 *joch* amounted to 35·88 % of the agricultural area, the edium-sized estates of 100–1,000 *joch* to 16·62 %, and the small oldings under 100 *joch* to 47·5 %.[3] The very small holdings up to hectares formed 53·6 % of the total number of holdings and only ·8 % of the agricultural area; holdings larger than 575 hectares ormed 0·2 % of the total number of holdings, but nearly one-third f the entire agricultural area. Before Jan. 1925, 597,094 *joch* ad been assigned to the peasants, and 127,471 sites allotted for ouses. The production of wheat has risen from 8,052,950 quintals 1921 to 18,385,000 quintals in 1925. The wheat exports have also creased very considerably, having in fact advanced from 176,949 uintals in 1921 to 1,803,918 quintals in 1924. A great impetus has een given to the cultivation of vines, but owing to tariff difficulties e export of wine is at present very much reduced.

Austria.—In Austria only 156 peasant holdings, covering 2,824 ectares, had been settled up to June 30 1924, in accordance with the esettlement law.[4]

Germany.—In Germany 1,468,915 hectares of large landed proprty in Prussia ought, according to the Land Settlement law, to have een made available for home colonisation in the years 1919–22, hereas the area actually so available was only 95,576 hectares. hat form will be taken, under stable economic conditions, by this ome colonisation, as it was envisaged by the originator of the scheme, rof. Max Sering, and how far the cry of the land-hungry population really stilled,[5] only the future can determine.

BALKAN STATES

Rumania.—In Rumania nearly half of the total agricultural ea belonged before the War to the large landowners, though eir number was scarcely more than ½% of the total numer of all the agriculturists. At the beginning of 1925, 5,713,598 ectares of land, or 30 % of the whole agricultural area, were exproiated under the land reform and assigned to the applicants for nd. In consequence of this the small holdings now amount in Old umania to 80·94 % of the cultivable area and in Transylvania to 9·34 %.[6] The production of wheat had fallen off in Rumania, s compared with the pre-War production, but it again shows a very arked upward tendency. The area under wheat increased from 488,335 hectares in 1921 to 3,300,900 hectares in 1925, and the roduction from 21,381,484 quintals to 28,946,700 in the correspondg years. The wheat export has also recovered to some extent: it ose from 756,903 quintals in 1921 to 1,216,150 in 1924, and the heat flour export from 194,223 to 1,165,270 quintals. Expansion the cereals export was, however, made impossible on account of the creased duty, partly imposed on political and financial grounds, artly with a view to ensuring low prices for bread in Rumania, but is duty was eventually reduced. Quite apart from this, it has been ecessary to import a considerable volume of cereals into Transylania from the parts of Rumania where the supply was abundant.

Yugoslavia.—In Yugoslavia the conditions of rural land tenure aried very much according to the provinces. Generally speaking, very peasant in Old Serbia had his piece of land, and there was little cope for land reform. In those provinces, however, which were reviously under Turkish rule, mediaeval feudal conditions still preailed in the country districts: in Bosnia and Hercegovina, the *met* régime, in Macedonia and a part of Montenegro the *Tchiftchius* ystem. The agrarian reform completely did away with this régime, nd the former *Kmets* became small proprietors. In the former ustrian provinces such as Croatia, Slavonia, etc., more than half the agricultural land was in the hands of the large landowners, p to the end of 1923 in the whole of Yugoslavia 501,966 *joch* of ltivable land were divided among 185,905 families.[7] Wheat growing has made satisfactory progress, the yield rising from 14,100,300 quintals in 1921 to 22,403,100 in 1925, while the wheat export advanced from 470,729 quintals in 1921 to 1,772,764 in 1924.

Bulgaria.—In Bulgaria it is hardly possible to speak of a predominance of large ownership. The principal object of the land reform was to secure a better distribution of land between the medium sized and small farms, and up to the end of 1923, 1,885 hectares of land had been assigned to 780 persons. The cultivation of tobacco, which takes an important place in the agriculture of Bulgaria, has shown remarkable progress. In 1924 the production amounted to 436,975 quintals as compared with 129,848 quintals in 1914. In 1924 there was an export of 31,735,000 kg. of tobacco of the value of 1,828,109,000 leva.[8] In 1925 for various reasons the production of tobacco fell off to a perceptible extent.

Greece.—In Greece 832 large estates were expropriated up to 1923, and 7,500 small farmers were presented on an average with 13·5 hectares each. The peasants grow for the most part commercial crops, such as currants and wine-grapes, the export of which has noticeably increased.

WESTERN EUROPEAN COUNTRIES

In western Europe even less than in Germany or Austria is it possible to speak of agrarian reform in the sense in which it has occurred in the countries of eastern Europe. The conditions of tenure of agricultural land have undergone slow though continuous modification without any remarkable alteration having come about in the traditional agrarian system of the separate countries. In England, the classic instance of a country of large estates and large and medium sized tenancies, the number of occupying owners has almost doubled. In 1910 there were 55,433 such owners, holding 3,329,015 ac., while the total number had in 1924 become 94,236 holding 6,574,074 ac., or nearly one-quarter of the total area of England and Wales, 29,739,000 acres.[9] Thus there has come about in this country what the Hon. Edward Wood (Lord Irwin) called (Dec. 9 1924) "a silent revolution." Indeed, in view of the fact that the rôle of the large landowner as the provider of credit for agriculture is disappearing, while at the same time this function devolves more and more upon the state, he added ". . . and so you may well find yourselves in the course of the next 30 or 40 years within measurable distance of something like nationalisation by a side wind." This would imply the virtual realisation of the land reform programme as proposed by Lloyd George—the taking over of the land by the state, which then assigns it to tenants in hereditary usufruct.

Italy.—In Italy there were in 1912 4,931,000 agricultural holdings, including 3,275,000 of less than one hectare each, 614,000 of from one to two hectares, and 450,000 of two to four hectares. At the same time in some provinces the extent of the latifundia was very considerable for example, in Caltanisetta, out of the whole area of 322,865 hectares, 134,807 were latifundia, or 41·7 %; in the province of Palermo the percentage was 35·0, and in the provinces of Sicily taken as a whole nearly one-third.[10] A bill of the transformation of the latifundia for purposes of home colonisation was passed by the Chamber of Deputies on Aug. 19 1922, but was thrown out by the Senate at the end of the same year.

Denmark.—The agrarian policy is directed increasingly towards the promotion of rural small ownership. The object of the so-called old Small Holdings Act of 1899 was mainly the settlement of land workers. The land was procured for this purpose on the open market with the help of state loans. From 1900 to 1924, 11,451 small holdings were formed in this way, the state assistance amounting to about 100,000,000 crowns.[11] (*See* DENMARK: AGRICULTURE).

The intention of the framers of the new Small Holdings Act of Oct. 1919 was to establish peasant holdings as economically independent units, the Govt. supplying land on favourable terms to applicants by purchase of church lands, of entailed lands, etc. The average size of the holdings is now fixed at 7½ hectares, as compared with 3½ before the War. In accordance with this law in the years 1920–24, 2,251 new holdings were formed covering 15,874 hectares, and 3,040 hectares were allotted for 1,258 very small holdings. In all 14,960 peasant holdings have been formed since 1900. At the present time the question is being asked whether the obtaining of land for small holdings would not be greatly facilitated by expropriation of land in the case of property which exceeds a given extent.

III. CONCLUSION

The changed conditions of tenure of agricultural land are to be traced back almost entirely to social causes, and land reform is thus rather a problem of the more equal division of property than one of increase of production from landed property. None the less the land reforms are already of proved economic value, although the peasant holdings that are their outcome are still in the first stage of adaptation to the new conditions. The advance of agricultural production is determined, not merely by the greater or less area of the peasant farms, but in a marked degree also by the psychological attitude of the peasant to his land, his joy in production and will to work. It is this imponderable factor, defying measurement, but, when multiplied a million fold, yielding in due time great results, that is the true achievement of the agrarian reforms. The lessons of the War come to this, that a sound distribution of ownership, together with a large peasant class, tends to conditions of agricultural progress and forms the essential presupposition of social peace. LANE, FRANKLIN KNIGHT (1864–1921), American public official, was born near Charlottetown, P.E.I., Canada, July 15 1864. He graduated from the University of California in 1886. He began his career as a newspaper reporter, studied law and was admitted to the bar in 1889. He practised in San Francisco, drafted a charter for that city and soon afterwards, in 1897, was elected city attorney, to which office he was twice re-elected. In 1902 he was the unsuccessful Democratic candidate for governor of California, and the following year failed in his election for the U.S. Senate. In 1905 he was appointed by President Roosevelt a member of the Interstate Commerce Commission and was retained by President Taft, serving for eight years, part of the time as chairman. In 1913 he entered the Cabinet of President Wilson as Secretary of the Interior. During his term of office the wealth of Alaska was made more accessible by the construction of a Government railway. Dams were built in several western states for conserving the water supply in dry regions. To the Indians he gave special attention, maintaining that perpetual tutelage was wrong. He advocated development of national resources without waste as being reasonable conservation. He was an earnest advocate of reclamation of lan In 1916 he was a member of the American-Mexican Joint Hig Commission, and the following year became a member of th Council of National Defense. In 1920 he resigned his post a Secretary of the Interior. He was treasurer of the Europea Relief Council. He died at Rochester, Minn., May 18 1921. H was the author of *The American Spirit* addresses delivered i War time (1918). See also A. W. Lane and L. H. Wall, *Th Letters of Franklin K. Lane, Personal and Political* (1923).

LANE, SIR HUGH PERCY (1875–1915), Irish art collecto was born in Co. Cork Nov. 9 1875, the son of the Rev. J. W Lane. He entered the firm of Colnaghi & Co. in 1893 and rapidl made a name as a connoisseur of extraordinary perception. I 1898 he began dealing on his own account. He took a prominen part in the revival of an interest in art in Ireland, especially i establishing a gallery of modern art in Dublin. A fine collectio was ultimately made, and housed in Harcourt Street, Dublin where it was opened in 1906. He was knighted in 1909. Lan offered a number of old masters to the city of Dublin but, owin to the attitude of the Dublin corporation, his gift did not tak effect. He acted as adviser on the formation of the Johannesbur Municipal Gallery of Modern Art (1909), and brought togethe the Cape Town National Gallery collection of 17th centur Dutch pictures (1912). He was in 1914 appointed director of th National Gallery of Ireland. He was drowned in the sinking o the "Lusitania," May 7 1915.

See Lady Gregory, *Hugh Lane's Life and Achievements: with some account of the Dublin Galleries* (1920).

LANESSAN, JEAN MARIE ANTOINE DE (1843–1919), French statesman and naturalist (*see* 16.169), retired from politics in 1914. Among his latest works were *La crise de la République* (1914); and *L'histoire de l'entente cordiale Anglo-Française* (1916). He died at Écouén, Seine-et-Oise, Nov. 8 1919.

LANG, ANDREW (1844–1912), British writer (*see* 16.171), died at Banchory, Aberdeenshire, July 20 1912.

LANG, COSMO GORDON (1864–), Anglican divine, was born in Aberdeen Oct. 31 1864, the son of John Marshall Lang, sometime moderator of the Church of Scotland. Educated at Glasgow University and Balliol College, Oxford, he graduated in 1886 and two years later was elected a fellow of All Souls. In 1890 he was ordained and was appointed curate of the parish church of Leeds. From 1893 to 1896 he was fellow and dean of divinity of Magdalen College, Oxford, and from 1894–96 vicar of the University church of St. Mary's. In 1896 he became vicar of Portsea, and in 1901 suffragan bishop of Stepney, London, and canon of St. Paul's Cathedral. In 1908 he was appointed archbishop of York. His eloquence and clear common sense made him an influential member of the House of Lords, and in 1909 he was appointed a member of the royal commission on divorce.

His published works include *The Miracles of Jesus as Marks of the Way of Life* (1901); *Thoughts on some of the Parables of Jesus* (1906); *The Opportunity of the Church of England* (1905).

LANGLOIS, HIPPOLYTE (1839–1912), French general (*see* 16.177), died in Paris Feb. 12 1912.

LANGMUIR, IRVING (1881–), American chemist, was born in Brooklyn, N.Y., Jan. 31 1881. He studied at the Columbia school of mines, proceeding in 1903 to the University of Göttingen. He was instructor in chemistry at Stevens Institute, Hoboken, N.J., from 1906 to 1909, since which time he has engaged in physico-chemical research for the General Electric Co., Schenectady, New York. He invented the gas-filled tungsten lamp and the condensation pump for producing high vacua; his inventions in the field of electric discharges are largely responsible for the modern vacuum tube used in radio. In 1911 he discovered the atomic form of elementary hydrogen, and subsequently developed a process for welding metals by flames of atomic hydrogen. In 1917–8 he was engaged at the Naval Experimental Station, Nahant, Mass., developing devices for submarine detection. For his work in the field of molecular physics he received in 1918 the Hughes Medal of the Royal Society, London.

LANKESTER, SIR EDWIN RAY (1847–), British biologist, s born in London May 15 1847, and was educated at St. Paul's hool, Downing College, Cambridge, and Christ Church, ford. In 1872 he was elected to a fellowship at Exeter Col- e, Oxford. During 1874–90 he was professor of zoology and nparative anatomy at University College, London, and from 91–8 Linacre professor of comparative anatomy at Oxford. om 1898 to 1907 he was director of the natural history depart- nt of the British Museum, and from 1898–1900 he held the llerian professorship of physiology and comparative anatomy the Royal Institution, London. He did valuable research k on the comparative structure of animals, both living and inct. To the general public he became known owing to his ccessful presentation of scientific subjects in a popular form. was elected F.R.S. in 1875, and was awarded the Royal edal in 1885 and the Copley Medal in 1913. In 1884 he founded e Marine Biological Association, becoming its president in 92. He was awarded K.C.B. in 1907. His numerous publica- ns include *Comparative Longevity* (1871); *Degeneration* 880); and the several editions of *Science from an Easy Chair* 908, 1910, 1912); *Diversions of a Naturalist* (1915); *Science d Education* (1919); *Secrets of Earth and Sea* (1920); and *eat and Small Things* (1923). He was for many years editor *The Quarterly Journal of Microscopical Science.*

LANREZAC, CHARLES LOUIS (1852–1925), French soldier, as born at Pointe-à-Pitre, Guadeloupe, July 31 1852. While the École de Guerre, the new French doctrine of strategy and ctics was being established under the influence of Maillard, anglois and Bonnal. To this doctrine Lanrezac himself con- ibuted in his study *La manoeuvre de Lützen*. He became colonel 1902, general of brigade in 1906, and general of division in 11. In 1912 he commanded the XI. Corps, and on April 10 1914 cceeded Galliéni as a member of the Conseil Supérieur de la uerre and commander-designate of the V. Army. His theories summarised in the article *Stratégie* of the *Dictionnaire mili- ire* were not in accordance with the modern theory of an inces- nt and universal offensive, of which plan 17 was an example. his plan assumed that the V. Army would attack east of the euse towards Neufchâteau. Lanrezac pointed out in his report July 31 1914 that if the extreme German right crossed the euse north of Givet the V. Army at Neufchâteau would be rned. Neither he nor Joffre anticipated the magnitude of the erman attack, though he feared an enemy attack between amur and Givet aimed at Chimay and the sources of the Oise d the direct road to Paris. He therefore sought and obtained rmission on Aug. 12 to place the I. Corps (left) in the Dinant gion, and to make preliminary arrangements for moving the rest his army towards the northwest. On Aug. 15 the Germans hav- g endeavoured to cross the Meuse at Dinant, General Joffre rdered the transfer of the army on the left bank.

On Aug. 21 Lanrezac asked Joffre whether he should attack e following day, but was then violently attacked by Von ülow's army, and the battle of Charleroi began. The arrival of e III. German Army forced the I. French Corps to fall back the Meuse, while the III. Corps had to yield. On the evening the 23rd Lanrezac was obliged to order a retreat, which lasted om Aug. 24 to Sept. 5. On Aug. 27 orders were given to renew e offensive at Saint-Quentin in order to assist the British. This rder provoked a violent disagreement between Joffre and Lan- zac. Nevertheless Lanrezac renewed his offensive on the 29th d at the battle of Guise, won a brilliant tactical success. But e retreat continued, and on Sept. 3 Gen. Lanrezac was lieved of his command. In 1917 he was offered the post of ajor General of the armies by M. Painlevé, but he refused d suggested Gen. Pétain. "He is one of my own children," said, "and I can answer for him." On July 3 1917 he was ade grand officer of the Legion of Honour and on Aug. 29 1924 was given the grand cross of the same order. He died on n. 18 1925.

See Lanrezac, *Le plan de campagne français et le premier mois de la uerre* (1920); Jules Isaac, *Joffre et Lanrezac* (1022); F. Engerand, *anrezac* (1926). (H. Bi.*)

LANSBURY, GEORGE (1859–), British politician, was born on Feb. 21 1859 in Suffolk. Working in a timber business, in London, he became a member and trustee of the National Union of General Workers. He abandoned his early Liberalism to found the Church Socialist League and to join the Independent Labour party. In 1909, as a member of the Royal Commission on the Poor Laws, he signed the Minority Report, and started an active campaign for its adoption. Elected M.P. for Bow in 1910, he supported the militants in the women's suffrage movement, and in 1912 resigned his seat to test opinion on the subject, but was defeated; he recaptured it, however, in 1922. In 1913 he became editor of *The Daily Herald*, which he carried on as a weekly during the War period. From 1920, on its revival as a daily, he was again editor, becoming general manager in 1922. In 1925 he resigned this post and founded *Lansbury's Weekly*, a journal friendly to communism. He visited India and Russia, publishing his book, *What I Saw in Russia*, in 1920. He was elected a borough councillor in 1901 and was mayor of Poplar from 1919–20 but he refused a post in the Labour Govt. (1924) and criticised its policy in many respects.

LANSDOWNE, HENRY CHARLES KEITH PETTY FITZMAURICE, 5TH MARQUESS OF (1845–), British statesman (*see* 16.184), had, during his tenure of office as Foreign Secretary (1900–5), definitely set his mark on British foreign policy at a critical period of history. In 1900 Great Britain felt all the disadvantages of isolation. Lord Salisbury's system of a general reliance on Germany and the Triple Alliance (Germany, Austria and Italy) had become no longer possible, in view of the open expression of German ill-will during the Boer War, and of the German resolve to build a fleet sufficiently large to constitute a serious challenge to the British Navy. On the other hand, Great Britain had nearly come to blows with France over Fashoda (Kodok), and her historical friction with Russia continued. Her isolation was especially marked in the Far East. Germany, Russia and France had forced Japan, after her Chinese War, to relinquish her conquest of the Liaotung peninsula. England had refused to join the other European Powers in their action, but had simply stood on one side. Subsequently Russia had over-run Manchuria and seized Port Arthur; France had effected a favourable revision of her frontier in the Mekong valley, and Germany had seized Kiaochow. It is Lord Lansdowne's main title to fame that he rescued Great Britain from this position of peril, procured her an ally in the rising maritime Power of the Pacific, Japan, and in Europe established her on terms of friendship and mutual understanding with France, by clearing away all the sources of bickering between Paris and London.

When the Duke of Devonshire resigned from Mr. Balfour's Government in 1903, Lord Lansdowne became the Conservative leader in the House of Lords, and though the fall of the Ministry in Nov. 1905 transferred him to the Opposition bench he remained the leader of the majority of that House till Dec. 1916. His polished and courteous manner, his thorough acquaintance, both with his work and with the idiosyncrasies of the peers, his cool temper and the sweet reasonableness of his expositions of policy speedily rendered his leadership most acceptable to his followers, in spite of the drawback, from the point of view of the Tory majority among them, that he was himself an old Whig. He rendered consistently patriotic support to the development by Sir Edward Grey of the foreign policy for which he himself had been responsible. In domestic politics he endeavoured, as far as possible, to limit points of difference with the Commons; but the measures of the Liberal Ministry almost inevitably brought about a conflict, which came to a head over Mr. Lloyd George's budget of 1909. In advising the Lords to reject it—as they did—he claimed that it was not an ordinary budget, but emphatically one which ought to be referred to the electorate to decide. Next year, however, he accepted the result of the general election of Jan. 1910, as making it obligatory on the peers to pass the Finance bill.

After the second general election of 1910 on the point of the Lords' veto, Lord Lansdowne brought forward in 1911, as an alternative to the Parliament Bill, a scheme for reconstructing the Upper House, which however was dropped after a second reading. When the Parliament Bill itself came up to the House of Lords, he moved and carried, by 253 to 40, an amendment providing for a submission to a popular vote of bills affecting the constitution or otherwise of great gravity. From that amendment he and his friends would not, he said, recede so long as they were "free agents." Ministers immediately announced that they would not accept the amendment, and that the King had consented to create, if necessary, sufficient peers to ensure the passage of the bill in its original form. Lord Lansdowne held that, after this threat of coercion, the peers had ceased to be free agents, and he therefore advised them to desist from further resistance. In this advice he was supported by Mr. Balfour; but a vehement opposition developed in the Conservative party, headed by the ex-Lord Chancellor, Lord Halsbury, and these "Diehards" were supported by such a large body of opinion that the bill was only carried eventually by 17 votes.

This episode gave a shock to Lord Lansdowne's authority both in the House and in the Conservative party, but he remained leader and co-operated cordially with Mr. Bonar Law after Mr. Balfour's resignation. He fought the Irish Home Rule Bill and the Welsh Disestablishment Bill strenuously on their successive appearances in the House of Lords, and procured their rejection by large majorities. But he was always ready for an agreement by consent over the Irish question, to avoid the "irremediable misfortune," the "overwhelming catastrophe," of civil war. The World War reduced all these issues to minor significance, and Lord Lansdowne associated himself with Mr. Bonar Law in tendering at once the support of the Opposition to the Government in rallying to the assistance of France and Russia. In 1915 he joined Mr. Asquith's Coalition Ministry without portfolio; and took the lead in pressing the military service bills on the House of Lords. At the close of that Ministry he retired from office, the leadership of the House and of the Conservative majority passing to Lord Curzon. In his retirement he got somewhat out of touch with public opinion, and published in *The Daily Telegraph*, in Nov. 1917, a letter in which, to the general surprise, he advocated a negotiated peace instead of the policy of Thorough, on which the Ministry and the Empire were set. His ideas received hardly any support save from the small pacifist section. In subsequent years he suffered much from ill-health, and so took little or no active part in politics.

Lord Lansdowne's great and various services to his country were rewarded with the K.G., G.C.S.I., G.C.M.G. and G.C.I.E. He was a trustee of the National Gallery and chairman of the British Royal Red Cross Society 1915–20; he received honorary degrees from Oxford, Cambridge, McGill and Leeds. His elder son, Lieut.-Col. the Earl of Kerry, D.S.O., married Elizabeth Caroline, only daughter of Sir E. S. Hope. His younger son, Lord Charles Mercer Nairne, was killed in action in France in 1914. Of his two daughters the elder married the 9th Duke of Devonshire and the younger the 6th Marquess of Waterford and, after his death, Lord Osborne de Vere Beauclerk. (G. E. B.)

LANSING, ROBERT (1864–   ), American diplomatist, was born at Watertown, N.Y., Oct. 17 1864. He graduated from Amherst in 1886, was admitted to the bar in 1889, and for the next 18 years practised at Watertown. In 1892 he was associate counsel for the United States on the Bering Sea Commission, and later was American counsel or agent before several important arbitral tribunals or mixed commissions, including the Alaskan Boundary Tribunal (1903), the Hague Tribunal for the arbitration of the North Atlantic fisheries (1910) and the Anglo-American commission (1911) for settling outstanding claims between Great Britain and the United States. In 1914 he was appointed counsellor of the Department of State. When W. J. Bryan resigned (June 8 1915), Mr. Lansing was appointed Secretary of State *ad interim*. He was definitely appointed Secretary of State on June 23 1915. In his attempts to uphold American rights he was called upon to direct notes to all the countries at war. In reply to a note addressed by England to neutrals, asking that all belligerent submarines be excluded from neutral waters, he said that the nature of each submarine must govern the decision. He thus drew an important distinct between the "Deutschland," which had peacefully brough cargo to America, and the U53, which had raided several sh off the New England coast, Oct. 7 1916. In 1917 he notif President Carranza, of Mexico, that the United States wo not adopt his proposed Pan-American plan of stopping shipment of food and munitions to all the European belligere In Nov. 1917 he signed an agreement with Japan (the Lansi Ishii agreement) which, while recognising Japan's special int ests in China, provided for a continuance of the "open doo policy for commerce.

Lansing was a member of the American commission to ne tiate peace at Paris, 1918–9, and, together with Viscount C and Col. House, prepared a draft of the League of Nations Jan. 1919. On Feb. 13 1920 he resigned as Secretary of St on being reprimanded by the President for having called gether the heads of the executive departments of the Gove ment. Such meetings of the Cabinet had, however, frequen been called before during the President's illness, naturally the Secretrary of State as ranking member. In Aug. 1920 opened a law office in Washington. He was the author of *Peace Negotiations* (1921); and *The Big Four and Others* (19

LAPWORTH, CHARLES (1842–1920), British geologist 16.208), died at Birmingham March 13 1920.

LARDNER, RING W. (1885–   ), American author humorist, was born at Niles, Mich., March 6 1885. He recei his education at the Niles High School and the Armour Instit of Technology, Chicago. He was a reporter on the South B (Ind.) *Times*, 1905–7, after which he spent four years in Chica contributing to the sporting columns of various newspapers th He was editor of *The Sporting News*, St. Louis, 1910–1, and sp ing writer for the Chicago *Tribune* 1913–9, after which date was connected with the Bell syndicate. His humour is base part on its racy use of vernacular and the language of illitera He wrote a number of books, among which are *Bib Ball* (1915); *You Know Me, Al* (1916); *Gullible's Travels* (19 *Treat 'em Rough* (1918); *The Real Dope* (1919); *How Write Short Stories* (1924); and *The Love Nest* (1926).

LARMOR, SIR JOSEPH (1857–   ), British mathematici was born at Magheragall in Ireland on July 11 1857, and educated at the Royal Belfast Academical Institution, Quee College, Belfast, and St. John's College, Cambridge. Fr 1880–5 he held the post of professor of mathematics in Queen's University, Ireland, and from 1885–1903 he was turer in mathematics in the University of Cambridge, su quently becoming Lucasian Professor there. He carried much valuable research work in mathematics and mathemat physics, displaying a particular interest in the problems of e trodynamics and thermodynamics, and in the electrical pro ties of ether and matter. He was intimately connected for m years with the Royal Society, of which he became a fellow 1892, serving on the council and acting as secretary from 19 12. He received the Royal Medal in 1915, and the Copley Me in 1921. In addition to these he was the recipient of m British and foreign honours and awards, including in 1914 de Morgan Medal of the London Mathematical Society of wh he was at that time President. He was knighted in 1901, from 1911–22 was Unionist member of Parliament for C bridge University. His writings include *Ether and Ma* (1900), and numerous memoirs on mathematics and physics.

LASCELLES, HENRY GEORGE CHARLES, VISCOUNT (18), eldest son of Henry Ulick Lascelles, 5th Earl of Harewo was born Sept. 9 1882. He was educated at Eton and ente the Army as a lieutenant in the Grenadier Guards. For a ti he exchanged military for diplomatic service, becoming an h orary attaché to the Embassy in Rome 1905–7, and A.D.C the governor-general of Canada (Earl Grey) 1907–11. He ser in France during the World War, being three times wounc and winning the D.S.O. with bar, as well as the Croix de Gue In 1922 (Feb. 28) he married Princess Mary, only daughte King George V., and he was the same year created a Knigh the Garter. Through his grandmothet, Elizabeth Joan ughter of the 1st Marquess of Clanricarde, he inherited property, though not the titles, of his great-uncle, the ond and last marquess, who died April 12 1916.

LATIN LITERATURE (*see* 16.257).—During the period from t to 1926 the progress of Latin scholarship ran on well- rked lines. The closing decades of the 19th century witnessed great revival of classical study, parallel, if not due, to the at discoveries in natural science. It was realised that the doc- nes which were current, in almost every branch of the study antiquity, needed to be re-examined; and that the evidence ilable was far more extensive than previous generations of olars had been willing or able to contemplate.

Hence came a great addition to the original sources of infor- tion accessible. Newly discovered inscriptions, papyri, numents of stone and bronze and ancient remains of every d; manuscripts and the products of ancient and medieval olarship were newly read or newly analysed, and so made ilable for wholly new study, often in monumental publica- ns like the *Corpus Inscriptionum Latinarum*, which, despite 15 volumes, is still not yet complete. This new stream of earch, strictly scientific in character, still continues with rdly any diminution; and students of Latin literature have rnt to give heed to the methods and the fruits of these studies.

Study of the Great Writers.—But the special feature of the rs since 1910 has been a reassertion of the older and larger jects of classical study, namely, the interpretation and appre- tion of the greatest authors, not in a spirit of opposition to new research, but in alliance with it, and on the strength of results. Thus, for example, in 1896 Theodor Mommsen was ntent to determine the date of an inscription, then newly dis- vered on the island of Philae in the Nile, and to show that it s probably one of the monuments set up or permitted to be up in his own honour by Cornelius Gallus during his governor- p of Egypt in 26 B.C.; and hence that it was one of the causes the anger of Augustus and of the fall and suicide of Gallus— good history, but, so far as Mommsen took it, with no par- ular literary bearing.

But Mommsen's results have since[1] been combined with what have now learnt about the poet-soldier Gallus from a deeper dy of Virgil's *Eclogues*, and with what the ancient commen- ors record about the curious ending—or want of ending—of ok IV. of the *Georgics*, so as to make clear how it was that gil came to mutilate what was probably the most perfect em he ever wrote; and to suggest also how innocent his bosom- end Gallus, despite his Gascon vanity, had been of the graver rges laid against him. In this way a fact of Virgil's expe- nce, which must have contributed profoundly to shape his neral outlook, appears in clearer light, and the standing riddle the Aristaeus-Proteus-Orpheus-digression has found its l solution; the whole patchwork is nothing but a half-hearted empt to replace the *Praise of Gallus* (and of Egypt) by piecing ether three epyllia, of the poet's own earlier work, short rative poems in the Alexandrine style.

Of similar interest is the discovery by Prof. G. E. K. Braun- tz, in the course of studies of the ancient place-names of rth Italy and of the family-names of the same area recorded inscriptions, of new evidence which places Virgil's farm near lvisano, 30 Roman m. northwest of Mantua, not at the tradi- nal site two m. to the southeast in the marshes of Pietole. is has elucidated the story of his expulsion from his farm in B.C., and thrown much light on all the *Eclogues* whose scene aid in North Italy—that is, as has been now pointed out, all se with odd numbers.

New and more searching methods of manuscript study have added much to our knowledge of Latin authors. The ford series of texts with critical notes, though they vary a d deal in the fullness of their record, have at least made it icult for an editor of any ancient book to frame his text or nment without regard to the evidence of the different manu- ipts and the judgment of competent scholars upon their rth; just as no future editor of Juvenal can dispense with Prof. A. E. Housman's text (1905), or of the *Culex* (now attributed to Virgil by a clear and marked preponderance of expert opinion) without the same scholar's *Apparatus Criticus;* or of the *Metamorphoses* of Ovid without the critical edition by H. Magnus. Dr. J. P. Postgate's *Tibullus* and *Phaedrus*, and Profs. R. S. Conway and C. F. Walters' Livy I.–V. and VI.–X., Prof. H. W. Garrod's Statius (*Thebaïd* and *Achilleid*)—all five volumes in the Oxford series—have offered similar service towards the better understanding of these authors.

Further, the more profound analysis of the history of manuscripts due to such scholars as L. Traube, A. C. Clark and E. K. Rand, besides the editors just mentioned, has revealed the frequency, not to say regularity, of certain causes of corruption—especially the loss of whole lines, or groups of lines, in uncial codices, and has thus imposed a certain check on haphazard emendation, and given new guidance for our procedure (or non-procedure) in difficult cases. One result is that the formula with which the most brilliant critical scholar of the 19th century, J. N. Madvig, was wont to cut the worst knots—"Livius scribere debuit" (so and so)—has disappeared from the work of self-respecting scholars. We have learnt so much more of the possibilities of error in tradition that we are humbler in framing judgments on the writings of great authors in the form in which the centuries have left them.

These illustrations will suffice to show the way in which new knowledge in epigraphy, in the study of place names and in textual criticism has deepened the study of ancient literature. It would be easy to increase their number by others drawn from comparative grammar, comparative religion, glossography and the many recent developments of archaeology. A typical example of the application of several different lines of inquiry to a literary purpose is W. Warde Fowler's exposition[2] of the *Carmen Saeculare* of Horace and its performance on June 3 17 B.C., which combines the results of his own studies of Roman ritual with the evidence of recent excavation on the Palatine and of the inscription of Augustus (discovered in 1890) recording the celebration and containing the words *Carmen composuit Q. Horatius Flaccus.*

To such indications of growing knowledge perhaps it may be serviceable, so far as the judgment of an individual scholar may be trusted in such a matter, to suggest a few parts of the field of Latin study which seem to have been comparatively neglected in the period under review. Chief among these is certainly the text of *Horace*, where the number of MSS. is very large, and our knowledge of them, both in quantity and quality, lamentably small. Next, the metre and language of *Plautus;* for, despite the work recorded below, no commentator seems yet to have realised the far-reaching effects of the Sonnenschein-Wallstedt[3] discovery of the lawfulness of a spondee, even one whose first syllable bears the word-accent, in the fourth foot of an Iambic Senarius, provided that accent and ictus coincide in the fifth and sixth feet; *e.g.*, in Trinummus, 410,

> "Quam si tu obicias formicis papaverem,"

the fourth foot *micis* is a spondee with the first syllable accented, but is legalised by the coincidence of word-accent and verse-ictus in the quadrisyllable (*papăverem*); a similar solution applies to the corresponding difficulty in Trochaics.

Catullus, Tibullus and Statius, though frequently edited in whole or part, have not yet been adequately handled in the light of our present knowledge, though on Statius much valuable work has been recently done. For a commentary on the *Natural History of Pliny*, that discursive encyclopaedia of ancient learning, the student is often obliged to go far back into the 19th century, or farther still, for even the most obvious kind of help.

Besides actual commentaries, this period has produced a wealth of critical studies, directed to determining as precisely as possible, in the light of all the evidence yet available, what were the actual thoughts and motives of the greatest authors viewed in relation to the history of their times, rather than to appraising their merit in the abstract—a vain ambition, responsible for much writing of a type fashionable in the 19th century, which now seems superficial. Contrast, for example, Conington's introduction to his edition of Virgil with that of S.G. Owen to Ovid's *Tristia* (Book 2); or with the series of volumes initiated by Warde Fowler, devoted at first to the interpretation of the *Aeneid*, book by book, and later to other Virgilian topics; such a series could hardly have been projected or published in any earlier epoch of scholarship.

---

[2] *See* below, *Roman Essays and Interpretations*, p. 3.

[3] Emil Wallstedt, *Studia Plautina*, Lund Univ. Arskrift, 1909. Afd. 1 (esp. p. 89 ff.). E. A. Sonnenschein, *Accent and Quality in Plautine Verse*, Class. Rev. 20, p. 156 (1906).

Linked with this interpretative effort has been a desire, manifest alike in Britain, America, France, Italy, Germany, Holland and Scandinavia, to arrive at a clearer conception of the personality of the different authors, a desire more manifest than in any period since the New Learning of the 16th century. Indeed, in this and other ways the enterprising spirit of scholarship in the last quarter of a century has proved itself akin to that of the times of Thomas More, Spenser and Ben Jonson. Another is the multitude of translations of Latin authors begun in this period and still being poured out in many different series, affording no less clear evidence of quickened popular interest in classical study than did, in their own great way, the famous renderings of the Elizabethan era, North's *Plutarch* and Holland's *Livy*, to name no others; and in yet another feature, the abundance of what may be called propagandist literature which has grown up around Latin studies, the work of the 20th century shows a striking tendency to parallel, if not to imitate, the warm-hearted pleading of Roger Ascham or Sir Philip Sidney.

It is well to add that one of the features of the period has been the new organisation of the classical periodicals published in Great Britain; others have been newly established in the United States, Italy, Germany and Sweden. *The Classical Quarterly* had been separated, as an organ of research, from *The Classical Review* in 1906; but in 1910 both became the property of the Classical Assn., a body whose influence has done much to evoke and to guide the active work just described. In 1910 also a concordat was made between that association and the Society for promoting Hellenic Studies and the then newly formed Society for promoting Roman Studies respectively, by which the province of *The Classical Quarterly* was declared to be Greek and Latin language and literature (including texts, manuscripts and Indo-European Philology) approached by all methods save those mainly dependent on architectural remains or other archaeological evidence; whereas all study largely concerned with these was reserved for *The Journal of Hellenic Studies* and *The Journal of Roman Studies* in their proper spheres. This agreement has been happily carried out.

Further, when *The Journal of Philology*, long maintained by the support of the Cambridge Philological Society, was allowed to lapse (in 1920), that support was transferred to *The Classical Quarterly*. The *Review* and the *Quarterly*, with *The Year's Work in Classical Studies*, established by the Classical Assn. in 1906, are managed for it by the Classical Journals Board, on which the philological societies of Oxford and Cambridge are represented. All the Classical periodicals of Great Britain are therefore now conducted on a definite scheme which precludes overlapping. In America, beside the old-established *American Journal of Philology* and *Classical Philology* (a quarterly established in 1907), *The Classical Journal* (appearing in nine months of the year), which was founded in 1905, had by 1916 become the organ of the three powerful associations which now represent Classical studies in nearly the whole area of the United States.

In Italy the *Rivista Indo-Greco-Italica* began in 1916; in Germany *Glotta* (*Zeitschrift für Griech. u. Lat. Sprache*) at Göttingen in 1911; *Die Antike* (at Berlin) in 1923; and *Gnomon* at Berlin in 1924. In Sweden there was founded in 1925 *Litteris, an International Critical Review of the Humanities*, edited by Scandinavian scholars with associates in Germany, Denmark, England and France.

To this brief survey of the general tendencies of Latin scholarship may be added for practical purposes a brief list of the chief contributions to its different branches which have appeared in the period under review. The list is necessarily incomplete, b care has been taken to make it as representative as possible. is largely based on surveys by Prof. J. F. Dobson and Mr. A. Nock in *The Year's Work*, where fuller information will be foun

The following list excludes (*a*) all publications dealing with portion only of some large work, and (*b*) all new editions books published before 1911, save a few in either class of excep tional importance.

A. Critical Texts of Latin Authors; and Textual Studies.

1. Five excellent Series, two begun in this period, all continu (*a*) in the Oxford Bibliotheca Classica, *Livy 1–5* (1914) and *6*- (1919); R. S. Conway and C. F. Walters jointly (*21–25* in the press Ovid, *Tristia, Halieutica, Fragmenta*, S. G. Owen (1915); Phaedru J. P. Postgate (1919); Statius, *Silvae* (2nd ed., 1918), J. S. Phil more; *Thebaid* and *Achilleid* (1911), H. W. Garrod; *Tibullus*, J. Postgate (1914).

(*b*) In Teubner's texts (many re-edited): *e.g.*, *Apicius*, C. Giarr tano and F. Vollmer (1922); *Cato* (1923), G. Goetz; *Livy 41–45* ar *Fragments* (1912); W. Heraeus; *Martianus Capella*, A. Dick (192

(*c*) In the Corpus Paravianum (Turin): *e.g.*, *Caesar*, *Bellu Civile* (1916), D. Bassi; *Catullus* (1916) and *Cicero, De Republi* (1916), both by C. Pascal; *Justin* (1921), M. Galdi.

(*d*) In the Collection Budé (Paris): *e.g.*, *Lucretius*, A. Ernou *Ovid, Ars Amatoria*, H. Bornecque; *Seneca, Consolationes*, R. Walt

(*e*) In Hans Lietzmann's *Kleine Texte* (Bonn): *e.g.*, *Cicero P Milone*, with Asconius and the Schol. Bobiensia (1911), P. Wessne *Vitae Virgilianae* (1911), E. Diehl.

2. Single works: *Ovid, Metamorphoses* (Berlin, 1914), H. Magnu *See* also under B.

3. *Textual Studies: Apuleius*, D. S. Robertson, *Class. Quarter* (18), 1924. *Ibis*, A. E. Housman, *Journal of Philology*, 35 (1920 p. 287. *Livy;* R. S. Conway, C. F. Walters, J. F. Dobson, A. Ky Florence Whitehead, *Class. Quarterly*, 4–2 (1910–8), W. B. Anderso in *Class. Quarterly*, from 5 (1911) to 11 (1917). *Martial* and *Persiu* A. E. Housman, *Class. Quarterly*, 13 (1919) and 7 (1913); *Thebai* E. H. Alton, *Class. Quarterly*, 17 (1923), p. 175. *Thebaid* 2: W. Anderson, *Class. Quarterly*, 18 (1924), p. 203. *Virgil: Culex*, E. Alton, Hermathena, 14 (1920), p. 68 (based on A. E. Housman "Apparatus Criticus to the Culex," *Camb. Phil. Soc. Trans.*, 7, 1908

B. Editions with Commentary:

Prose authors: Caesar, *Bell. Gallicum* (Oxf., 1914), T. Rice Holme Cicero, *De Divinatione* (Illinois, 1923), A. S. Pease; *Disput. Tu culanae* (Berlin, 1918), M. Pohlenz; *Ad Q. Fratrem* (Leipzig, 1911 H. Sjögren; *De Finibus 1, 2* (Camb., 1925), J. S. Reid; of the gre commentary on the whole *Correspondence* (Dublin, 7 vol.), R. Tyrrell and L. C. Purser, the second edition as far as vol. 5 w completed by L. C. Purser in 1915; *Livy 6–8*, O. Rossbach (1925 *Ammianus Marcellinus*, C. U. Clark (1910 onwards); *Asconi* (Rome, 1920), C. Giarratano; Apuleius, *Apologia* (Città di Castell 1914), G. Marchesi, also (Oxf., 1915), H. E. Butler and A. S. Owe *Quintilian*, Book 1 (Camb., 1924), F. H. Colson; *Minucius Fel* (Utrecht, 1923), J. Van Wageningen; *St. Augustine, De Civitate D* (London, 1924), J. E. C. Welldon.

Poets: Ennius (Cambridge, 1925), Ethel M. Steuart; Lucretius and 2 (Paris, 1925), A. Ernout; and posthumously (Berlin, 1923 H. Diels; Horace, *Odes and Epodes* (Cambridge, 1921), H. Darnle Naylor, also (Berlin, 1917), R. Heinze; *Satires* (Paris, 1912), Plessis and P. Lejay jointly; Virgil, *Culex* (Paris, 1912), C. Plésent *Bucolics* (Paris, 1915), F. Plessis; *Georgics* (Paris, 1915), P. Leja *Grattius* (Oxford, 1918), P. J. Enk; *Manilius 1–4* (London, vol. 1921), A. E. Housman, also completely (Amsterdam, 1921), J. Va Wageningen; Ovid, *Tristia* 2, (Oxf., 1925), S. G. Owen.

C. Translations.

1. *Series:* (a) *Oxford Translations*, *e.g.*, *Catullus* (in English vers 1924), Sir W. S. Marris. (b) *Loeb Series: e.g.*, Caesar's *Gallic W* (1914), H. J. Edwards; *Cicero's Letters to Atticus* (1914), E. O. Wi stedt; *Velleius* (1914), F. W. Shipley; *Apuleius' Metamorphos* (1914), S. Gaselee. (c) *Bell's Classics; Varro on Farming* (Londo 1912), Lloyd Storr-Best.

2. Singly: *Lucretius on the Nature of Things* (London, 1918 Sir R. Allinson.

D. Literary Studies and Surveys.

1. *Studies:* (a) *Of the poets: The Original Element in Plaut* (Camb., 1917), K. M. Westaway; *Plautinisches in Plautus* (Berli 1922), E. Fränkel; *Ennius und Vergilius* (Leipzig, 1915), E. Norde *New Light on Lucretius*, John Rylands, *Lib. Bulletin*, 1926), J. P Postgate; *The Carmen Saeculare* (*Cl. Quarterly*, 4, p. 145), W. Ward Fowler; *Horace and His Age* (London, 1917), J. F. D'Alton; *Orazio Lirico* (Florence, 1920), G. Pasquale; *Horace, a New Interpretation* (London, 1924), A. Y. Campbell.

Of Virgil: In Blackwell's series (Oxford; continuing) *Vergil's Gathering of the Clans* (1916), *Aeneas at the Site of Rome* (1917), *The Death of Turnus* (1919), all by W. Warde Fowler; *Beasts, Birds and Bees in the Georgics* (1914), T. F. Royds; *Culex* (1926), D. L. Drew.

:r studies: *The Culex*, S. Elizab. Jackson, *Cl. Quarterly*, v. (1911); ıe Nationality of Vergil," *Class. Review* (1915), G. E. K. Braunz; "Copa Eclogue 5" and "Georg. 3, 1–48," *Class. Quarterly* 2–5), D. L. Drew; *Die Geburt des Kindes, Eclogue 4* (Leipzig,), E. Norden; *Where Was Vergil's Farm?* (Eclogues 1 and 9; ı Rylands, *Libr. Bulletin*, 1923), R. S. Conway; *Der Bukoliker* *ril* (Stuttgart, 1922), K. Witte; *Vergil's Biographia Litteraria* :., 1920), N. Dewitt; *Virgil and His Meaning to the World of* *lay* (Boston, 1924), J. W. Mackail.

f Horace, Virgil and others: *Collected Studies in Greek and Latin* *ılarship* (Camb., 1913), A. W. Verrall; *Roman Essays and In-* *retations* (Oxf., 1920), W. Warde Fowler; *New Studies of a Great* *eritance* (Cicero, Horace, Virgil and Livy; London, 1921), R. S. way; *Les Sources de Lucain* (Paris, 1912), R. Pichon; *Studi di* *eratura e Filologia Latina* (Turin, 1917), E. Stampini; *Latin* *ry* (London, 1922), E. E. Sikes.

) *Of prose authors: Cicero of Arpinum* (Yale, 1914), E. G. Sihler; *ro, a Biography* (Univ. of California, 1920), T. Petersson; *Les* *édés d'art de Tacite dans les Histoires* (Paris, 1918), E. Courbaud; *lies in Fronto* (Camb., 1912), M. Dorothy Brock; *Studia Ammia-* (Upsala, 1921), H. Hagendahl.

. *Surveys: The Love of Nature Among the Romans* (London, 1912), Archibald Geikie; *Agricola* (ancient Italian agriculture; Camb., 2), W. E. Heitland; *The Silver Age of Latin Literature* (London,), Walter C. Summers; *Geschichte d. Lat. Litteratur* (vol. 1 down 00 B.C., Berlin, 1913), F. Leo; *Storia della Letteratura Romana* vol., Naples, 1912, 1916), A. G. Amatucci; *The Legacy of Rome* f., 1923), edited by C. Bailey; *The Writers of Rome* (London, 1923), Vight Duff; *Kleine Schriften von Fr. Skutsch*, ed. by W. Kroh 14).

LEXICA AND INDICES.

'he vast *Thesaurus Linguae Latinae* (Berlin) is being resumed with Norden in place of F. Vollmer as editor-in-chief: in 1909 the letter as completed in vol. 4; in 1913 appeared vol. 3 of the *Onomasticon* w separate), with Proper Names beginning with C. *Index Catul-* *us* (New Haven, 1912), N. ATVIA.—A Baltic state and a member of the League of Nans. The Republic of Latvia, lying east and south of the Gulf Riga, was proclaimed on Nov. 18 1918. It embraces the vinces of Vidzeme, Kurzeme, Zemgale and Latgale, covering area of 24,400 sq. m., with a population of approximately 00,000 inhabitants, mostly Lutherans, divided, according to census of 1925, in the following proportions: Letts 75·93%, ssians 10·28%, Jews 4·5%, Germans 3·4%, Poles 2·5% and ıer nationalities 3·39%. The principal towns with their popuions are Riga, 337,699; Libau (Liepaja), 60,762; Dvinsk augavpils), 40,640; Mitau (Telgava), 28,325; and Windau entspils), 16,384.

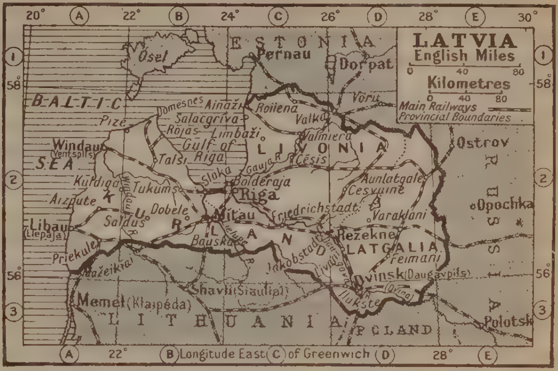
I. CONSTITUTION

The Constitution law, passed on Feb. 15 1922, came into force on Nov. 7, on the election of the first Latvian Parliament (Saeima) composed of one Chamber. The supreme executive power is vested in the electorate, which is composed of authenticated citizens of either sex who have attained the age of 21 years.



No lists are made of the electors, and consequently the voters are not bound to wards. The elections are effected by general, equal, direct voting, on the basis of proportional representation. The electorate is entitled (*a*) to elect 100 members of Parliament (Saeima); (*b*) at the instance of the president of the republic to decide, by means of a referendum, upon the dissolution of the Saeima, and thus indirectly on the president's resignation; (*c*) to submit to the Saeima amendments of the constitution or other proposed legislation on the demand of not less than one-tenth of the electorate; and finally, to demand a referendum for the adoption or rejection of bills and legislative resolutions. This right may be exercised in three ways: (1) by the obligatory referendum for proposed amendments to the constitution; (2) by the permissive referendum, in case on his own initiative or on the motion of at least one-third of the members of the Saeima, the president postpones for two months the promulgation of a law passed by the Saeima, and if not less than one-tenth of the electorate demand a referendum; (3) a legislative proposal brought forward by the nation is also put to the public vote if not accepted by the Saeima without alterations in the text.

The Saeima is elected for a term of three years, and its authority expires on the convocation of the new Saeima. The elections take place on the first Saturday and Sunday in Oct., and the new House assembles on the first Tuesday in November. The minority of the Saeima (not less than one-third) may demand the establishment of an inquiry commission and the shelving of a law passed by the Saeima for two months pending a referendum. The president of the republic is elected by the Saeima for a term of three years, with the possibility of being returned for a further period of three years, but his tenure must not exceed six consecutive years. The president has the power of initiating legislation, of granting amnesty rights, he is the chief of the armed forces of the state, and is vested with a suspensive veto right, though he may dissolve the Saeima only after a referendum. He may not be under 40 years of age.

The Cabinet of ministers is the executive organ. The responsibility of the Ministers to the Saeima is formulated in Article 59 of the constitution. The Prime Minister and the members of his Cabinet require the confidence of and are responsible to the Saeima for their official actions. The whole Cabinet must resign if the Saeima passes a vote of censure against the Prime Minister. If a vote of no confidence is passed on one of the ministers, he must resign, and the Prime Minister appoints another person in his stead. By the Cabinet law of April 1 1925, a vote of confidence of the Saeima is required before the Cabinet or a new minister may take up office. The Cabinet has the right in certain cases to proclaim martial law, and to issue emergency regulations. Resort was had to these powers on different occasions in the early days of the republic. The constitution secures freedom of action for the courts of law. The State Control law of Aug. 2 1923, based on paragraph 88 of the constitution provides Latvia with a completely independent and active State Control Department. The constitution of the Latvian Republic does not contain the usual legal guarantees for the citizens, but the right of assembly and the freedom of the Press are guaranteed by special laws which were passed by the first Latvian Parliament. The cultural autonomy of the national minorities has been legalised by the National Council.

II. POLITICAL HISTORY

Latvia's geographical location contributes to its political importance. This constant factor has always influenced the historical development of the country. Thus an important part is played by Latvia in connection with the problem of the *dominium maris Baltici* in the history of north-eastern Europe. The solution of this problem one way or the other has always affected the political position of the peoples on the Baltic seacoast. In the 9th century the Vikings crossed the Baltic to Russia, in the 12th the Germans proceeded from Bremen and Lübeck to colonise the Baltic coast, establishing a staple market at Wisby (Gothland). By then, the already politically organised Latvian tribes (Kurs, Semgallians, Seli, Talavians, Latgalians), moving seawards, had reached the mouth of the river Dvina and the seacoast, and assimilated the inhabitants of the coast, the Livs (of Finnish origin). The Latvian tribes, however, had not yet crystallised into an organised united state, and, while the Scandinavians were distracted by internal disturbances, the Germans gained a footing in Livonia.

After fighting until about 1450, an episcopal state was founded in conjunction with the Livonian Order, as the precursor of the Federal State of Livonia founded about the middle of the 15th century, and embracing Estonia and Latvia of to-day. The problem of the Baltic Sea was again acute towards the middle of the 16th century, when Moscow turned to the Baltic coast after having destroyed the trade of Novgorod (a Hanseatic creation) and annexed the Ruthenian duchies bordering on Latvia. Then it was that the Hanseatic structure of all the Baltic began to fall, while Germany was in the throes of the reformation movement and Sweden evinced a desire to establish itself beyond the Baltic Sea. Having made a union with Lithuania, Poland too, showed a tendency to expand in the same direction. These conflicting efforts led to a partition of Livonia, and so Estonia became Swedish, Livonia Polish, Pilten in North Courland and the isle of Oesel Danish, while Courland was converted into a duchy under Polish suzerainty, and later became an important state under Duke Jacob, a godson of James I. of England.

Simultaneously with the expansion of Sweden's power, Livonia and Riga were occupied at the beginning of the 18th century, whereby the Swedes contributed largely to the cultural progress of these parts by founding schools, establishing legal and clerical order, protecting the peasantry and translating the Bible. Latgalia alone was left under Polish rule. By then an united Latvian people had evolved out of the separate tribes, though the estate owners were not Latvians. This continued until the beginning of the 18th century, when, in alliance with Poland, Russia undermined Sweden's power and under the Treaty of Nystad, 1721, occupied South Finland, Estonia and Livonia, afterwards turning on Poland and destroying her.

The whole of Latvian territory was united under Russian rule after the partitions of Poland (1772–95). The reforms introduced by the Swedes were rescinded, and the estates which were formerly held in fee became the hereditary possession of the nobility. The position of the peasants grew worse, and repeated revolts ensued. Only in 1807 a law was passed in St. Petersburg giving the peasants hereditary possession of the land cultivated by them on their own behalf. But after Napoleon's downfall, this law was modified to the effect that the landlords retained possession of the land, which the peasants could acquire by purchase only. The landed proprietors, mostly German Balts, also recovered all their feudal privileges, as game and fishing rights, and patrimonial rights. They also enjoyed the sole right to establish industrial enterprises.

This state of affairs lasted till the beginning of the 20th century, and only shortly before the World War was the idea of a limited self-government with the participation of the more important small landowners conceived. During the 19th century the co-operative movement, loan-banks, etc., enabled the growth of a larger and more independent class of Latvian small farmers; the landless proletariat went to the towns and evolved in a revolutionary direction. A Latvian educated class came into being; a Latvian daily press and theatre were founded. A nationalist and revolutionary movement began to grow. The national leaders, A. Kronvalds, K. Valdemars, J. Kalnins, F. Grosvalds and others, received much valuable assistance from some liberal German clergymen. In the Latvian revolution 1904–5, the first declaration of Latvian independence was mad Russia had to reinstate herself by armed force. She put t revolution down with much bloodshed. There was practical no improvement in the position of the peasants, as not even t Russian conception of self-government (the Zemstvo) was e tended to this region (*see* also LITHUANIANS AND LETTS, 16.78

The War Period.—At the outbreak of the World War, the fu force of the attack fell on Latvia and the other frontier region In the year 1915 Tsar Nicholas II. permitted the organisati of a national Latvian Army, which subsequently proved to the foundation of Latvia's political independence. Neverthele the Latvian nation was subjected to great suffering in cons quence of compulsory evacuation to Russia.

After the Russian revolution in 1917 the Latvian Refuge Committee developed into a powerful organisation, and depute its representatives J. Chakste and Z. A. Meierovics to Stockhol and from thence to Paris, where they took part in the pea negotiations. On Nov. 30 1917, shortly after the Bolshevi revolution, the Latvian National Council, under the leadersh of V. Zamuels, was formed in Walk, Riga having been und German occupation since September. The National Counc issued an exhortation to the people to make practical use of th right of self-determination proclaimed by President Wilso The delegations sent to Paris and London were vested with fu powers by the National Council in Walk. The Brest-Litovs Treaty of 1918 was most emphatically rejected by the Latvia National Council. Solemn protest was raised against the di memberment of the Latvian nation by the then leaders of Ge many's eastern policy, which purported to create a Duchy Courland in personal union with the Kingdom of Prussia, an to make of Livland, Estonia and the adjacent islands a Balt state under German suzerainty. Latgale was to be ceded Russia in order to lend another direction to Polish irredentism Germany's Baltic policy was really introduced by the agraria regulation of Field-Marshal Hindenburg of July 17 1918 for th colonisation of Courland. A colonisation union, after the Germa pattern, was formed in Courland, at the disposal of which on third of the landed property of the Baltic nobility was volu tarily placed. The Hindenburg agrarian order nullified Balt private rights in respect of land agreements for a period of years, but made no provision for Latvian peasants.

The Allied victory in the autumn of 1918 frustrated the plans. The Democratic Bloc led by K. Ulmanis was formed Riga, and pursued the aims of the National Council in Wal After the collapse of German power in the Baltic, the Dem cratic Bloc gained a firmer footing and by Nov. 18 1918 th members of the Refugees' Committee in Petrograd and those the Walk National Council had arrived in Riga. The All-Latvi National Council was composed of representatives of the pea antry, of the workmen, making together two-thirds, while th last third was made up of the representatives of Latvian me chants and manufacturers, house-owners and national minor ties, of whom the representatives of the liberal Balts wer particularly active.

Independence.—The *de facto* recognition of the Latvian Na tional Council by Great Britain on Nov. 11, and shortly afte wards by other Powers, led to the solemn proclamation of th Latvian Republic on Nov. 18 1918. A provisional governmen was formed under K. Ulmanis pending the convocation of Constituent Assembly. J. Chakste, a barrister and former Lat vian deputy in the Russian Duma, was elected president of th National Council, then president of the Constituent Assembl and eventually by the Parliaments of 1922 and 1925, presiden of the republic.

The Provisional Govt. was practically penniless, and lacke military power. The Latvian regular troops, left in the lurc by the Russians, had retreated before the advancing German from the Dvina front to Russia, where their sense of disciplin was exploited by successive governments. Only after the con clusion of the Latvo-Russian peace treaty in 1920 were they able to return home. The work of national organisation wa rupted by Bolshevist invasion until May 22 1919. The isional Govt. and the National Council retired, under Bol- st pressure, to Libau, where they held their ground with elp of troops mobilised in Courland. A Latvian Army was ed, commanded first by Col. Kolpaks, and after his death ol. (General) Balodis. The German-Baltic Landeswehr also d the anti-Bolshevist front. Libau was then the seat of the nan occupation administration under Gen. von der Goltz. social democrat Winnig functioned as representative of the nan Government. Amidst these chaotic conditions the Ger- "Putsch" of April 16 1919 was foiled in the attempt to hrow the Cabinet of K. Ulmanis.

ie loyal forces, with the Baltic Landeswehr, advanced nst the Bolsheviks, liberated Riga on May 22 1919 and ned the enemy to the Russian frontier. Similar operations conducted in North Livland by the North Latvian Army r Col. Semitan, with whom the Estonians sided against the neviks. After the failure of the second adventure of the nan Balts near Wenden, the Provisional Govt. headed by lmanis returned to the capital on July 7 1919 and resumed vork of organising the state, despite the obstacles presented continuous state of war. The complete repulse of the Bol- ists would have been effected much sooner had Riga not attacked on Oct. 8 1919 by the "Bermondt-Avalov" os, composed of Russians and Germans in disguise, insti- d by the Baltic nobility. This invasion from the direction ithuania and Courland was liquidated by the end of Nov. with the help of British and French naval artillery. Latgale liberated from the Bolshevists in Jan. 1920 by combined sh-Latvian action; all Latvian territory was now free. With nany, which had assumed the protection of the Bermondt os, an agreement was made on July 15 1920 for the resump- of normal relations. Peace was concluded with Russia on 11 1920.

eanwhile the Latvian Constituent Assembly had met on 1 1920 and elected Mr. J. Chakste to the presidency. The stituent Assembly, summoned by general vote, passed the rian law of Sept. 16 1920, which liquidated the system of anded properties, and placed the expropriated land at the osal of a special land fund. The landlords were left in pos- on of a certain portion of their estates, not larger than 50 ares, with live stock and inventory. The law limits the area ne new farms to 22 hectares. In this way the number of l farms was increased to over 200,000 and the state was ed on a firm social basis (*see* FINANCIAL AND ECONOMIC HIS- , below). Many other important laws were passed, *e.g.*, Free Port Law of May 20 1920.

litical Parties.—The first Latvian Parliament, which met on 7 1922, consisted of 62 non-Socialist and 38 Socialist members. ne second Parliament, elected in Oct. 1925, there were 63 non- lists, and only 37 Social Democrats, four of whom belong to Revisionist branch. Communism is weak in Latvia, and is y banned. The non-Socialist deputies are divided among al parties. Many non-Socialists are returned by the peasantry. ne second Parliament, for instance, the Farmers Bloc, including sentatives of the so-called Young Farmers, was 27 strong. The speople elected representatives of the middle classes, besides Social Democrat deputies. There is also a conservative repre- tion originating from the parishes. The number of parties is y due to the system of proportional representation, which en- every 100 electors to add to the list of candidates. Moreover minorities form national groups in Parliament. In the second ament there were 5 Germans, 5 Russians, 2 Poles, 4 Jews.

ne Social Democrats adhere to the Second International, and l for the promotion of industry, protective labour legislation, the international neutralisation of Latvia. The Farmers' Union l for development of agriculture, for protective duties, ameliora- credits, restoration of the devastated regions, in general for sifying agriculture, and for efficient means of defence, civil , property rights and, politically, for a union of the Baltic es. The Democratic Centre share radical democratic views based ever, on the sovereignty of the state. The groups of the Right, xample, the National Christians, are strongly clerical. Another on represents trade and industry. The different Latgallian es present a variety of local demands, though they side with corresponding Lettish parties in questions of general State y. In ecclesiastical matters certain groups of the Left demand eparation of the Church from the state and the cessation of the state subsidy to the Church. The racial minorities make special demands, the Jews asking for extensive modifications in the law regarding citizenship, while others watch the interests of the landowners dispossessed under the Agrarian Reform laws.

Foreign Relations.—In the sphere of foreign policy the idea of a Baltic States Union is predominant. The so-called "small" programme seeks a union with Estonia and Lithuania—a lesser group advocating a Baltic Union embracing Finland and Poland. Towards proposals for a four-state-union excluding Poland, Finland maintains an attitude of reserve. In accordance with the Latvo-Estonian Treaty of Nov. 1 1923 negotiations were undertaken for a Customs Union between these two states. Latvia also entered into a defensive alliance with Estonia. No passports or visas are required for nationals crossing the Latvo-Estonian frontier. Negotiations with Poland led only to the conclusion of a consular convention. With Finland, as with the Scandinavian states, a treaty of commerce has been concluded, together with an arbitration agreement which was signed by the representatives of Latvia, Estonia, Finland and Poland at the conference of the Baltic states in Helsingfors in 1924. Latvia has also entered into a number of trade agreements and legal protection treaties with the European Powers, in particular a Treaty of Commerce and Navigation with Great Britain on July 22 1923, a trade convention with France on Oct. 29 1924, as well as trade agreements with Switzerland, Czechoslovakia, Turkey, Hungary, Austria, Japan, Belgium, Italy and the United States. In its trade agreements Latvia makes provision for the so-called Baltic and Russian clause, reserving the possibility of closer economic contact with the Baltic states and the development of transit traffic with Russia, which was facilitated by the technical agreements concluded in Aug. 1924. Relations with Russia are good and becoming more and more normal.

Latvia joined the Permanent Court of International Justice at The Hague, and couples the conclusion of trade agreements with the signature of legal protection and arbitration conventions. Negotiations for an economic treaty were begun with Lithuania on May 19 1924. With Germany an agreement was reached in principle regarding an arbitration convention and mutual settlement of claims.

As Latvia was recognised *de jure* by the Great Powers on Jan. 26 1921, and admitted to the League of Nations on Sept. 22 of the same year, diplomatic relations are maintained with the corresponding states. A concordat was signed with the Holy See on May 30 1922.

III. ADMINISTRATION, EDUCATION, ETC.

There are some 6,000 state officials. Teachers, judges, foresters, railwaymen, the agents and employees of government enterprises and monopolies are paid by the state. The Latvian Army is directed by experienced staff officers and graduates of the Riga Officers' School, who complete their military education in France and in Poland. Apart from the regular army there is a territorial voluntary defence force, divided into regiments and companies after the model of the Finnish Defence Corps. The Latvian Defence Corps include cavalry and cyclist companies. Military games and rifle clubs are also popular. The young people receive military training, and the Boy Scout movement is well developed in Latvia.

The whole country is divided into 19 administrative districts and 3 prefectures: Riga, Libau, Daugavpils. Extensive autonomy is granted to the towns and parishes. The smallest units of rural self-government are the rural communes, of which there are about 510 in all. Markets are held in 80 towns and villages, 37 of these having town councils.

Justice.—The administration of justice is entrusted to the justices of the peace, four district courts, the Court of Appeals and the Senate. The judges cannot be dismissed from office. The old local Baltic provincial law is still in force; and in Latgale the Russian law in part, pending codification. As the constitution provides only for a single legislative Chamber, the Saeima, the functions of a second Chamber are to some extent fulfilled by various committees in the different departments, as, for example, the financial council attached to the Ministry of Finance, the Agricultural Council to the Ministry of Agriculture, special committees for music, theatres, etc., attached to the Ministry of Education, and so forth. Civil interests are protected by numerous recognised associations, as chambers of commerce, guilds, etc.

Vital Statistics.—The bulk of the population of Latvia are engaged in agriculture, only 35% of the population being urban. 41,172 births and 28,399 deaths were registered in 1924.

Co-operation.—The co-operative system is widespread and both consumers' and agricultural societies are largely developed. The system of social clubs and unions is extensively adopted in rural districts, and is generously supported by the so-called Culture Fund created by levying a 3 % tax on railway tickets. It has thus been possible to establish public libraries, co-operative houses, etc., in the country. Education is further promoted by an itinerant theatre, several provincial theatres, and an opera house in Libau ranking second to the National Opera House in Riga.

Education and Culture.—School attendance is compulsory in Latvia. In addition to the public elementary schools there are secondary schools, commercial colleges, several language institutes, and other advanced and specialised educational institutions. Illiterates form only 8·5 % of the population, and for every 100,000 of the population there are 300 university students. The study of German or English is compulsory in the middle schools, German holding the first place; French and Russian are optional. Due encouragement is also given to the elementary and middle schools of the national minorities in the form of state grants to German, Russian, Jewish and Polish schools.

Zalts, *Die politischen Parteien Lettlands* (Riga, 1926). (A. B.)

IV. FINANCIAL AND ECONOMIC HISTORY

Latvia lost nearly 40% of her population in the World War, mainly by emigration in consequence of the German invasion. Hardly 300,000 have returned out of the refugee population of 1915–7. The greater part of the missing, near 650,000, perished. Almost all the industries and the industrial population were evacuated to Russia; 10,000 farms were utterly destroyed. Machinery and equipment of industries employing over 100,000 factory hands were sent to Russia in 20,000 railway trucks. Of these the Bolshevists have restored barely 200 trucks under the Peace Treaty of Aug. 13 1920. In Courland the population and cultivated areas at the time of the German occupation, 1915 to 1918, had diminished to one-third. Over half of the farms were destroyed or stood empty.

Production—Cultivated Areas.

	1909–13 hectares	1920 hectares	1924 hectares
Rye	351,000	196,000	266,000
Wheat	33,000	16,000	43,000
Barley	191,000	124,000	179,000
Oats	306,000	216,000	334,000
Mixed grain	. .	46,000	77,000
Peas	23,000	20,000	39,000
Potatoes	80,000	49,000	75,000
Flax	70,000	30,000	60,000

The total cultivated area was thus in 1924, except for mixed grain, 996,000 hectares, *i.e.*, 5·2 % less than in 1909–13.

The harvests were:—

	1909–13 metric tons	1920 metric tons	1924 metric tons
Rye	325,000	119,000	199,000
Wheat	38,000	11,000	43,000
Barley	173,000	66,000	162,000
Oats	279,000	113,000	271,000
Mixed grain	. .	29,000	76,000
Peas	18,000	13,000	35,000
Potatoes	639,000	375,000	676,000
Flax fibre	30,000	10,000	25,000
Flax seed	25,000	10,000	26,000

The grain harvest, apart from mixed grain, reached 833,000 metric tons in 1909–13, in 1920 only 322,000, in 1924 only 710,000. Only the potato harvest reached its pre-War figure, the linseed crop was the same, the flax fibre one-sixth less. Four-fifths of the flax fibre harvest is exported.

Finances.—When the Latvian Republic was formed on Nov. 18 1918, the country was greatly impoverished owing to the requisitioning of corn, cattle, horses, etc., by the German armies of occupation, though part of the supplies which could not be carried away were sold back to the peasants on the evacuation of the troops. In April 1919, a new paper currency, the Latvian rouble, was issued by the Govt., which continued for a considerable period to finance its requirements by this means, with the result that the exchange in terms of sterling rose from 215·5 roubles on Jan. 1 1920, to 2,000–2,400 roubles in May 1921. After the demobilisation of the arm the autumn of 1920, the fresh issues of currency were mainly production purposes, and flax, hides and linseed were purchase this means from the peasants. The sale of the stocks thus acqu brought in 2,000,000,000 paper roubles to the state and enabled Finance Minister in office in March 1921, Ringold Kalning, to r the value of the rouble to 1,140 to the pound sterling, at which p it was stabilised. The currency was backed by gold to the valu 15,000,000 gold francs and by foreign balances amounting to 7,7 000 gold francs. The lat (=gold franc) was fixed at a value o paper roubles, and the 2,270,000,000 paper roubles in circulat were thus covered to the extent of about 50 % in gold. In 1923 Bank of Latvia was founded and provided by the state with a cap of 10,000,000 lats.

The total foreign debt amounted to 39,360,000 lats in the mi of 1922, of which one-third had been paid off by the middle of 1 At the end of 1925 there remains a debt of 5,500,000 dollars to United States for famine relief in the summer of 1919, and of ab £1,350,000 newly regulated debt to England for War deliveries. finances in the last three years have been very soundly handl not only has the foreign debt been considerably reduced, but lo to the value of 30,000,000 lats were made from current revenue. Budget of 1925–6 provides for further loans amounting to 35,0 000 lats from current revenue for agricultural purposes and for construction of railways. The actual revenue for 1924–5 amoun to 215,680,000 lats and expenditure to 214,000,000. The Budget 1925–6 balances at 160,000,000 lats (excluding railway receipts the expenses of the spirits monopoly).

Trade.—Latvia's trade balance has been adverse since 1920. official figures showed the following results:—

Calendar year	Imports (In millions of gold lats)	Exports (In millions of gold-lats)
1920	97·0	62·3
1921	73·4	28·9
1922	107·4	102·0
1923	211·9	162·0
1924	256·4	170·6

But an inquiry undertaken by the Latvian "Ekonomists" 1925 No. 22 showed that the import figures were 10 % too high.

Taking into consideration the circumstance that the 221,000 r gees who had returned since the middle of 1920 had brought bac least 33,000,000 lats, that moreover the Letts who had emigrate America had remitted at least 33,000,000 to Latvia, that good transit to Soviet Russia brought in 18,000,000, that unregiste exports amounted to about 40,000,000, etc., the "Ekonomis reckoned that the balance of payments to Jan. 1 1925, in reality sho a surplus of 3,000,000 lats in favour of Latvia. The present wr considers, after comparing the figures of the Latvian exports those of English statistics of imports, that the Latvian ex figures are about 10 % too low, so that in reality a surplus of ab 55,000,000 lats would result in the Latvian balance sheet from 1 to Jan. 1 1925. In the year 1925, the imports, according to off statistics, amounted to 280,000,000, the exports to 179,600,000 la

By reducing the import figure by 10 %, and raising the ex figure by 10 %, the adverse balance is reduced from 70,000,000 41,000,000 lats. But unsold imported goods valued at 70,000,000 said to be in Latvian warehouses. Meanwhile the adverse bala has created such anxiety, that Parliament decided in 1926 to incre the existing high customs duties of 20 % to 100 %.

Latvia's chief exports are timber amounting to about 60,000,000 l about four-fifths of which goes to England, and flax export amount to about 20,000 tons, valued at 50,000,000 lats. In the calen year (1925) the butter export was estimated to be 7,150,000 k grammes, valued at 30,300,000 lats.

The chief imports are textiles, 50,000,000 lats, machines 24,000,0 foodstuffs 70,000,000. In 1924 110,000 tons of rye and wheat w imported, 20,000 tons of sugar, 4,000,000 lats worth of tobacco. T imports of tea and coffee are small, also of fruits, on account of high customs duties.

Agrarian Reform.—Under the agrarian laws, 499 private esta were appropriated in Courland with an area of 1,124,000 hecta in Livonia 1,300,000 hectares; in Latgale about 750,000 hecta But from this area must be deducted the old peasant properties, a forest and uncultivable land. In reality there remained for divis among the newly established peasant properties in Livonia and Co land only an area of 832,000 hectares of agricultural land, *i.e.*, ara meadow and grazing land, in Latgale rather more than 250,0 hectares. Up to June 15 1925, 82,761 new farms were establish enclosing 100,000 hectares of forest land. The newly founded peasa properties consisted of 15 to 17 hectares, the largest to 22 hecta But included in the above-mentioned 82,761 new farms are abo one-third garden and artisans' holdings with an area of about 2 to hectares. A further 20,000 small holdings are to be established. T state has retained about 1,500,000 hectares of forest and abo 500,000 hectares of uncultivable land, chiefly peat moor; the form landowning nobility have only retained 50 hectares of land each.

UE, MAX VON (1879–), German physicist, was born
9 1879 at Pfaffendorf near Coblenz. He attended the uni-
ties of Strasbourg, Göttingen and Munich, and became an
tant in the University of Berlin, and later in Munich, being
equently called to the University of Zürich as professor.
here he went to the newly formed University of Frankfurt
the Main), finally proceeding to Berlin University as a
tor of the Institute for Theoretical Physics. He specialised
neoretical physics, and is regarded as one of the most
us champions of modern theories, and especially of Ein-
's theory of relativity. He also devoted his attention to
quantum theory, to the Compton-effect (alteration of the
iency of Röntgen rays), to Bohr's atomic model, to the
nstein-Bohr equation" and the disintegration of atoms.
914 he was awarded the Nobel prize for physics. Besides his
for scientific publications, he also writes for the daily Press.

ce 1910 he has published the following books: *Ueber e. Versuch*
ptik d. bewegten Körper (1911); *Die Beugungserscheinungen an*
unregelmässig verteilten Teilchen (1915); *Ueber d. Möglichkeit*
Versuche an Glühelektroden (1919); *Die Relativitatstheorie*
); *Ueber d. Auffindung d. Röntgen-strahlinterferenzen* (1920); *Das*
kalische Weltbild (1921); *Die Bedeutung d. Nullkegels in d.*
neinen Relativitätstheorie (1922); *Die Lösungen d. Feldgleichungen*
hwere v. Schwarzschild (1923); *Zur Theorie d. v. glühenden Metal-*
usgesandten positiven Ionen und Elektronen (1924); and with
V. Gordon, *Ein Verfahren z. Bestimmung d. Wärmeleitfähigkeit*
lühtemperaturen (1922).

UNDRY WORK (*see* 16.282).—Modern laundry work in its
nercial aspect requires an elaborate mechanical plant very
ent from the crude appliances which were the first out-
th of domestic processes of treading, pounding or rubbing.
ccess owes much also to chemistry, by which suitable soaps,
hes and solvents have been evolved.

chinery.—The washing-machine consists of a horizontal
drum in which revolves the inner cylindrical cage which
the clothes. This cage is divided into compartments of
us sizes, thereby offering a chance for sorting the clothes
so reducing, or almost eliminating, the need of marking
ents. Within each compartment, wash bags, "nets," are
ently used to hold fabrics of the same kind, thereby safe-
ling delicate garments. The machine is equipped with hot
old water and high-pressure steam, the latter serving as a
ng as well as a sterilising medium. With the rotation of the
which is reversed by automatic gearing every few revolu-
the clothes are rubbed or pounded, producing a displace-
of dirt through the soap and water which are forced through
bric. The operations of soaking, washing, bleaching (when
d), sterilising, rinsing, blueing and even starching, are
in the machine without removal of the garments and often
ut inspection during the process. Sterilising was formerly
nplished through boiling (212° F.), a process which, due to
ndency to weaken the fabric, has been replaced by keeping
arments at about 180° F. for a time sufficient to effect the
. Stains insoluble by soap and water require special chem-
leansing (*see* DRY CLEANING).

e process of drying, formerly accomplished by twisting by
or pressing between hard rubber revolving wringers, is
ed industrially by machines which in recent years, have
adapted for use in the home (*see* HOUSEHOLD APPLIANCES).
xtractor consists of a metal basket revolving in a closed
drum. There are two types, the "under-driven" and
over-driven." The latter is used for the heavy-type work
he wet-wash or bundle work. The basket makes 1,000
100 revolutions a minute, the water being expelled by
fugal force until the desired degree of dryness is attained.
rying is completed by means of box dryers, which, in their
improved form, consist of a heated revolving cage, called a
tumbler, within which hot air is agitated by means of suction fans and blowers. This device prevents the yellowing and scorching of fabrics through excessive heat and eliminates the adherence of lint to the clothes. A softer finish also is imparted by this means to woollen garments and the time required for finishing is greatly reduced.

Ironing.—Having been washed, starched and dried, the garments are then transferred to the ironer. The earlier form of ironer was the box mangle, by which clothes were calendered as in paper or textile manufacturing. This mangle, sometimes known as the "flat-work ironer," has been replaced in more up-to-date laundries by gas and steam-heated revolving rolls, which press against concave beds of polished metal or over-felted rolls, as a flat iron is used on a padded ironing table. Ironers may be operated by hand, gas, gasolene, electricity or steam. While it was formerly customary for laundries to charge for work by the piece, a "rough dry" service has been widely offered, in which the cost is based on weight, none of the work being ironed. Another service is "float iron," in which everything is pressed by the "flat-work ironer," the cost being considerably less than for work finished by hand.

Statistics.—The annual volume of business done by laundries in the United States in 1923–5 was between $300,000,000 and $500,000,000. The production of laundry machinery in 1923 was valued at $19,000,000, an increase of 46% over the corresponding figure for 1921. In the same period the output of home washing-machines increased 69%, standing at $57,000,000 in 1923. These increases reflect several economic and social factors, the more important being an increase in wealth and the scarcity of domestic help, both of which have operated to transfer laundering from the home to central plants. The same factors have led to the installation of numerous electric washers and ironers in the home. The popularity of light, delicate fabrics in women's garments together with the lavish use of colour have placed an added burden on laundries, making necessary the services of textile experts. The interests of the industry are furthered by laboratories, research bureaux and professional schools financed by the trade. Trade papers, courses in technical schools, co-operation among operators, and other factors have done much to improve the status and efficiency of the industry.

LAURIER, SIR WILFRID (1841–1919), Canadian statesman (*see* 16.286), was defeated at the general election in 1911, but remained leader of the Opposition until his death. Previous to the dissolution of Parliament in 1911, he had begun negotiations for reciprocity with the United States which was vigorously opposed in the Dominion House of Commons, and was, in a manner, responsible for the fall of his party. The Banking Act introduced by the Conservative party was much on the same lines as that outlined by Sir Wilfrid during the last years of his administration. In the prolonged naval debate in 1913 Sir Wilfrid urged the maintenance of a purely Canadian Navy. At the outbreak of the World War in 1914 he eloquently defended Great Britain's cause and supported the urgent measures that were adopted for the maintenance of the Canadian troops. He was however strongly opposed to conscription on the ground that it was a departure from the enactments of the Military Service Act, and a still wider departure from the principles of constitutional government. When Sir Robert Borden was invited to attend continuous meetings of the War Cabinet in London, Sir Wilfrid expressed his desire to facilitate public business in Canada in order to make the absence of the Premier possible. He declined, however, to enter the Cabinet in the Coalition Government. In 1918 Sir Wilfrid took part in the debate on hereditary titles and honours in Canada and was pronounced in his utterances against them. He died in Ottawa Feb. 17 1919.

LAUSANNE, CONFERENCE OF:—The Conference of Lausanne, between the Turkish Govt. established at Angora, and the governments of the four principal Allied Powers (Great Britain, France, Italy, Japan), Greece, Bulgaria and Yugoslavia, with the United States represented by an observer, lasted, with a break in the middle, from Nov. 20 1922 to July 24 1923, and resulted in the signatures of no less than 17 diplomatic instruments.

The most important of these were:—

1. The Treaty of Peace itself (July 24 1923).
2. Convention respecting the régime of the Straits (July 24 1923).
3. Convention respecting the Thracian frontiers (July 24 1923), under which neutralised and demilitarised zones were established.
4. Convention respecting conditions of residence and business and jurisdiction in Turkey (July 24 1923), to replace the capitulations.
5. Commercial convention (July 24 1923).
6. Convention respecting the exchange of Greek and Turkish populations and protocol (Jan. 30 1923).
7. Greco-Turkish agreement on the restitution of interned civilians and the exchange of prisoners of war (Jan. 30 1923).
8. Declaration relating to the administration of justice (July 24 1923) to replace the capitulations (No. 11).
9. A protocol relating to the evacuation of the Turkish territory occupied by the British, French and Italian forces, and declaration (July 24 1923) (No. 14).
10. Protocol relating to the Karagach territory, and to the islands Imbros and Tenedos (July 24 1923) (No. 15).
11. Protocol relating to treaties regarding the protection of minorities in Greece, and regarding Thrace, which had been concluded on Aug. 10 1920 between Greece and the principal Allied Powers (July 24 1923) (No. 16). (*See* DARDANELLES; DEDEAGAACH; MOSUL; TURKEY.)

Conditions before the Conference.—The Lausanne Conference took place under conditions quite different from those which had prevailed during the Peace Conference of Paris, and the resulting diplomatic instruments therefore bore a different stamp from the four European peace treaties and the instruments subsidiary to them. At the time of the Paris Conference the Powers just defeated in the War of 1914–8 had been temporarily impotent, and the victorious Powers had agreed among themselves as to what the terms of peace should be. The draft treaties embodying inter-Allied agreements had simply been submitted to the defeated Powers for their observations, which the victors had then accepted or rejected at their discretion, after which the vanquished parties had been compelled to sign the instruments by *force majeure.* At the conference of San Remo (*q.v.*) a peace treaty between the Allies and Turkey had been drawn up by the same procedure, and after the representatives of the Ottoman Govt. of Constantinople had submitted their observations, and these observations had been rejected, they were compelled, at Sèvres, on Aug. 10 1920, to sign the terms presented to them. By this time, however, the Constantinople Govt. had ceased to exercise any authority in Turkey outside the narrow areas under the military occupation of the principal Allied Powers. The greater part of the country was under the effective control of a new national government seated at Angora; and this Govt. was carrying on a war against the Greeks (who had landed at Smyrna on May 16 1919, at the invitation of Great Britain, France and the United States).

The Angora Govt. repudiated the Treaty of Sèvres, and continued to fight for the terms laid down in the Turkish National Pact of Jan. 28 1920. In Sept. 1922 the Greco-Turkish War in Anatolia was brought to a decision by the complete victory of the Turkish Nationalist forces, who drove the Greeks into the sea, and came into direct contact with the British forces in the zone of the Straits. On Sept. 23 1922 the principal Allied Powers invited the Angora Govt. to a peace conference on two bases: (1) the restoration of Turkish sovereignty over Constantinople and Thrace up to the line of the river Maritsa; (2) the exclusion, pending the final settlement of Turkish military forces from Thrace, and respect by the Turks for certain zones adjoining the Straits which the Allied authorities had declared neutral during the Greco-Turkish conflict. On Sept. 23 the Angora Govt. accepted this invitation, and proposed a preliminary armistice conference, which met at Mudania on Oct. 3 and resulted in the signature of an armistice convention on the 11th.

Results of the Conference.—Thus the Turkish delegates came to Lausanne as victors in their recent local war with the Greeks, and on an equal footing with the principal Allied Powers. by whom they had been defeated four years earlier in the War 1914–8. Indeed, during the whole period of the Lausanne co ference, the Turks were less unwilling to resume hostilities tha were the principal Allied Powers, who had long ago demobilise the greater part of their forces in the East under pressure fro their taxpayers, and who could now no longer call upon t Greeks to fight their battles for them. This complete revers of the situation reflected itself in the contrast between the ter of the Treaty of Lausanne and the Treaty of Sèvres, as well in the method by which the Lausanne conference was conducte This conference was noteworthy as the first meeting betwe ex-allies and ex-enemies in the World War, in which peace w negotiated and not dictated. In this respect it anticipated t London reparations conference of 1924 and the Locarno securi conference of 1925.

The Turkish Gains.—In brief, the Turks secured at Lausan practically everything which they had demanded in the national pact. In respect of territorial boundaries, the form Arab provinces of Asiatic Turkey, which had been detached fro Turkey as a result of the World War and had been mandated France and Britain under the supervision of the League Nations, were not restored, but otherwise Turkey recover everything which she had possessed in 1914, particularly Smyrn Constantinople and Eastern Thrace. Even as regarded the Ar territories, she obtained some concessions, since the Lausan Treaty confirmed the rectification of the northern frontier Syria in Turkey's favour, which had been made by the so-call "Franklin-Bouillon" Agreement of Oct. 20 1921, while t destiny of the Mosul province was referred, by agreement b tween Turkey and Great Britain, to the League of Nation In regard to the Dardanelles and the Bosporus, the settleme made at Lausanne has been described elsewhere (*see* DARD NELLES). The special spheres of influence in Anatolia whi had been assigned to France and Italy by a tripartite agreeme of Aug. 10 1920, between these two Powers and Great Britai were tacitly dropped, and there was no further question giving autonomy to Northern Kurdistan or of ceding Turki territory to the Armenian Republic of Erivan, which had no been included in the dominions of Turkey's ally, the Union Socialist Soviet Republics.

Again, no restrictions were imposed on the Turkish naval a military forces, and no control was asserted by the Allies ov Turkish finance, though certain financial questions, such as t rate of exchange at which the pre-War creditors of Turkey we to receive payments, remained contentious. The capitulatio under which foreign residents in Turkey had lived since the 16 century were swept away, and the only special safeguard left foreigners was the institution of legal councillors, without exec tive power, who were to be nationals of ex-neutral states. for such minorities as remained in Turkey after the great exod of Christians from Anatolia and Eastern Thrace which acco panied the Greek débâcle of 1922, it was settled at Lausan that they should receive all, and only, the guarantees which h been secured to minorities in Europe in the special minorit treaties or minority clauses in the peace treaties signed aft the World War. Meanwhile, on Jan. 30 1923, the Greek a Turkish delegations had signed a separate convention providi for the compulsory interchange of minorities left on the wro side of the new frontier, with a special exemption in favour Christians domiciled in the city of Constantinople, and of Mo lems domiciled in Western Thrace.

LAVERAN, CHARLES LOUIS ALPHONSE (1845–1922), Fren physician, was born in Paris June 18 1845 and was educated a the Strasbourg faculty of medicine. In 1874 he joined the st of the Val-de-Grâce military school of medicine, and four yea later was sent to Algeria. He remained there until 1883 and i was appointed professor of military hygiene and clinical cine at Val-de-Grâce. In 1894 he relinquished these posts took up work at Lille and Nantes. He was in 1895 elected mber of the French Academy of Science. His chief contribu- to medical science was his discovery of the *hématozoaire*, a site that causes malarial fever. He was the author of im- ant studies of sleeping sickness and of the rôle played by quitoes in epidemics. Laveran, who retired from active tice in 1897 and received the Nobel Prize for medicine in ; died in Paris May 18 1922.

s works include *Traité des maladies et des épidémies des armées*); *Du Paludisme et son hématozoaire* (1891); *La prophylaxie du disme* (1903); with Félix Mesnil, *Trypanosomes et trypanoso- es* (1912).

AW, ANDREW BONAR (1858–1923), British statesman, was in New Brunswick, Canada, Sept. 16 1858, the son of a byterian minister, the Rev. James Law, by his marriage Eliza, daughter of William Kidston of Glasgow. A Scot on sides, he came to Scotland when still a boy and finished his cation at Glasgow High School. He entered at once into mercial life in Glasgow, and became a member of a kins- 's firm, William Kidston and Sons, iron merchants, subse- ntly joining William Jacks & Co., also iron merchants. er acquiring a sufficient competence in business, he went into liament in 1900 as Conservative member for the Blackfriars sion of Glasgow.

lis commercial experience had led him to the conclusion t free trade, in the Cobdenite sense, was no longer beneficial Great Britain. A speech which he made on April 22 1902, in our of Hicks-Beach's corn duty, having favourably impressed House, he was promptly appointed parliamentary secretary he board of trade in the Conservative Government. When Mr. mberlain started his tariff reform movement in 1903, he nd a warm supporter in Mr. Law, who wished to see more material imported and fewer manufactured goods, who nted "dumping," and who held the true field of commercial ansion to be within the Empire and therefore advocated pref- ntial duties. Mr. Law shared in the general rout of the nservatives in Jan. 1906, and had another electoral mishap in c. 1910; but in each case came back to the House shortly at a election, and took his full share in the Opposition attack on Lloyd George's 1909 budget and on the Parliament Bill. kept aloof from the "Die-hard" movement, and warmly ended his leader, Mr. Balfour, from the reproaches cast upon . This loyal attitude, no doubt, was one of the reasons, and strong Tariff Reform programme was another, which rec- mended him to his party as Mr. Balfour's successor in the dership when the claims of Mr. (afterwards Sir) Austen amberlain and Mr. (afterwards Lord) Long appeared to ide the Conservatives pretty evenly. Both the rivals stood aside, d on Nov. 13 1911 Mr. Law was unanimously elected leader the Commons, Lord Lansdowne continuing to lead the party the Lords.

As Opposition leader, Mr. Law was very trenchant in his ticism of the Government, and put up a strong fight against ministerial bills introduced to take advantage of the Par- ment Act, his principal concern being the Home Rule Bill, d the situation created in Ireland by its introduction. At ster 1912 he went to Belfast, and, at a great demonstration esided over by Sir E. Carson, encouraged the Ulstermen to ist to themselves; and at a large Unionist gathering at Blen- im on July 27 he said that the Ulster people would submit to no cendancy, and that he could imagine no lengths of resistance which they might go in which he would not be ready to support em, and in which they would not be supported by the over- elming majority of the British people. Meanwhile, he had to al with differences inside his own party as to the extent to ich the Tariff Reform policy should be carried. A con- lerable section, especially strong in Lancashire, were definitely ainst any duties on food; and the assurances which Mr. Law ve in a speech at Ashton-under-Lyne on Dec 16 1912 did not nvince them that there was no possibility of food taxes being imposed without reference to the people. As the party dreaded a split, Mr. Law and Lord Lansdowne, in response to a general appeal, gave on Jan 14 1913 a formal promise that food duties should not be imposed without the approval of the electors at a subsequent general election. The imminent danger of the Ulster problem, on which Mr. Law had insisted for two years, brought ministers in 1914 to express a readiness for compromise; but no settlement, satisfactory to the Opposition, had been formed when the World War supervened.

Directly the crisis became acute Mr. Law wrote, on Sunday Aug. 2, on behalf of Lord Lansdowne and their colleagues, tendering to Mr. Asquith the unhesitating support of the Opposition in any measures necessary to support France and Russia; and when hostilities began he aided the national cause and promoted recruiting by speeches at the Guildhall, London, and in Belfast and elsewhere. Even when criticism of the management of the War began legitimately to spring up in the early months of 1915, he used his influence to repress or moderate its expression in Parliament. He promptly accepted Mr. Asquith's proposal in 1915 to assist in forming a Coalition Govt. and brought seven of his colleagues into the Cabinet, accepting himself the Colonial Secretaryship. He took charge in the House of Commons of the first military service bill in Jan. 1916 and got it through all its stages with little difficulty. He promoted the economic conference in Paris in June 1916 and, as principal representative of his country, was largely influential in carrying through the co-operative and protective resolutions then adopted. He was a member of the War Committee of the Cabinet, but, like Mr. Lloyd George, he was far from satisfied with its organisation and powers. It was natural therefore that he should be one of the four persons, besides Mr. Lloyd George, to whom that statesman, forcing the issue on Dec 1 1916, asked Mr. Asquith to confide the absolute conduct of the War. In the confused crisis which followed, the Premiership was offered to Mr. Law; but he recognised that Mr. Lloyd George was the Prime Minister whom the nation demanded, and to a Ministry formed under him, the Conservative leader brought the full cooperation of his party.

In this second coalition, Mr. Law, whose followers supplied the main body of the ministerial supporters, was partner rather than second-in-command of his chief. Besides Chancellor of the Exchequer and member of the War Cabinet, he became leader of the House of Commons, so as to enable the Prime Minister to devote the whole of his energies to the prosecution of the War. The House was at first disposed to resent this arrangement; but before long its respect and indeed affection were won by its new leader's business habits, his courtesy, his readiness to yield in non-essentials coupled with firmness in essentials, his exceptional clearness of head and of expression, and his extraordinary capacity for impromptu reply, without taking a note, at the close of a long debate on an intricate subject involving perhaps complicated figures.

It was his duty, as Chancellor of the Exchequer, to find the money to meet the gigantic cost of the War, and this was done principally by means of two great loans and by numerous increases of taxation. The first loan was launched in Jan. 1917, and its basis was the issue of a 5% Government Stock at 95, while there was also a 4% tax-compounded loan issued at par. This brought in £1,000,312,950 from 5,289,000 subscribers. The second loan, launched in Oct. of the same year, was in form of National War Bonds, combining the advantages of short-term securities such as Exchequer bonds, and three sorts of longer-dated securities for 7 and 10 years, interest being, as before, 5% or 4% tax-compounded. The amount was unlimited; all the securities were for continuous sale till further notice, so that there might be a steady and persistent flow of money loaned to the State. This novel device was most successful. Down to Jan. 11 1919, £1,446,625,613 of these bonds had been sold, and nearly £50,000,000 small post-office bonds in addition.

Mr. Law's first budget, that of 1917, only raised the excess profits tax from 60 to 80%, and increased the taxes on entertainments, tobacco and dogs. But in his second budget, in 1918, he imposed additional taxation calculated to bring in £114,000,000. Income tax was raised from 5s. to 6s.; farmers' tax was doubled; supertax was increased; the stamp on cheques became 2d.; beer and spirit duties were doubled and tobacco and match and sugar duties raised; letters were to be 1½d. and postcards 1d. It must have been with peculiar gratification that Mr. Law announced in April 1917 that the Imperial War Cabinet had accepted the principle of imperial preference. Throughout the War he opposed a firm front both to pacifists and to pessimists, and never doubted that there could be no peace "until the Germans are beaten and know that they are beaten."

As the general election of 1918 approached he responded heartily to Mr. Lloyd George's proposal that the Coalition should be continued to forward after-War reconstruction, and he joined with him in issuing the letters, or certificates, nicknamed "coupons," accepting coalition candidates. The Coalition obtained an immense majority, and among the Coalitionists Mr. Law's special followers, the Unionists, had a considerable predominance. When the Ministry was reconstituted in Jan. 1919 the arrangement by which Mr. Law led the House was continued, as the Prime Minister would be much away at the Peace Conference; but he was relieved of the Exchequer, and took the sinecure office of Privy Seal. He was one of the British peace plenipotentiaries, though his duties at Westminster seldom permitted him to go to Paris; and he appended his signature to the Treaty of Versailles. During 1919 and 1920 he had a strenuous time, dealing with after-War disorders and projects, and in particular with the passing of the Home Rule Act of 1920, constituting two subordinate Governments and Parliaments in Ireland.

Mr. Law's incessant labours during and after the War undermined his health, which suddenly broke down in March 1921; and, on the advice of his medical advisers, he resigned office at once, and went away to rest in the south of France. His retirement was felt in Parliament as a personal loss, and there was corresponding satisfaction when he returned in the autumn greatly (but not, as it turned out, permanently) restored, and took part in recommending the Irish Treaty to the House of Commons. During the first half, and more, of 1922 he only spoke occasionally, but he watched carefully the increasing reluctance of the Conservative party to support Mr. Lloyd George and the Coalition; a reluctance which had indeed resulted in the formation of a large group of independent "Die-hards" under Lord Salisbury's leadership. When the question was brought to an issue at the Carlton Club meeting on Oct. 19, the decisive factor was Mr. Law's declaration that the only method of preserving the unity of the party was to come out of the Coalition and to appeal to the country as an independent body. Mr. Lloyd George at once resigned, and Mr. Law, after being unanimously elected to his old post of party leader, formed a purely Conservative Government, which did not include the most prominent Conservative Coalitionists. His action was endorsed by the country at the general election in Nov., when the Conservatives returned 344 strong, a majority of 74 over all other parties put together. He at once reduced the inflated Cabinet secretariat, and restored the Foreign Office to its former position in the official hierarchy; and he carried through Parliament the bill to establish the Irish Free State Constitution.

Though he proclaimed the policy of his Government to be one of tranquillity and stability, he found himself in the winter deeply involved in political troubles. Unemployment was rampant, with Labour unrest and housing problems threatening; a European Conference at Lausanne proved impotent in face of the obstinacy of Nationalist Turkey; and M. Poincaré, the French Premier, insisted, in spite of Mr. Law's personal intervention at Paris, on despatching a French military expedition to the Ruhr to exact reparations from Germany. Mr. Baldwin, his Chancellor of the Exchequer, did indeed succeed in concluding in January at Washington an arrangement to fund the British war debt to the United States; but the terms were so severe that the Prime Minister was at first reluctant to accept them. After such an anxious winter it is not surprising that in
the spring his health once more gave way, and he resig
office on Whitsunday, May 20, after a Ministry which
lasted 209 days. He survived for five months, dying on Oct
1923. He was buried in Westminster Abbey, with every sig
general and genuine mourning, the pallbearers including
Prince of Wales, and past, present and future holders of
office of Prime Minister. He married in 1891 Annie Pitca
daughter of Harrington Robley, of Glasgow, by whom he ha
family; but he was left a widower in 1909. Two sons perishe
the World War. (G. E. B

LAWN TENNIS (*see* 16.300).—The recent history of lawn te
may conveniently be dated from the year 1911. In that
the late Anthony Wilding (killed on the Menin Road du
the World War) was defending his title to the world champ
ship he had won in 1910, and one of the Wimbledon champ
ships was won by France for the first time when Max Dec
and André Gobert beat Wilding and Ritchie in the challe
round of the Men's Doubles. In that year, also, Mrs. Lam
Chambers defeated her challenger, Miss Boothby, herself
ex-champion, by 6–0, 6–0.

France might have advanced still further in 1912, but An
Gobert always seemed to be fated to break down at Wimbled
In those days the champion (in this case still A. F. Wildi
had to stand out while the rest of the players fought for
honour of meeting him. Gobert met A. W. Gore, and looke
certain winner until the English player managed to pass
two or three times at the net and broke up his brilliant atta
Gore, however, failed to beat Wilding, who was at this ti
approaching the zenith of his powers.

Wilding and McLoughlin.—The year 1913 can fairly
described as the first big "boom" year in lawn tennis, the rea
being the presence of a great personality. This was a 24-ye
old boy named Maurice McLoughlin, who had won the champi
ship of America the year before. He was called the "Ameri
comet" and, with his merry eyes and his mop of red hair
instantly took the fancy of the great international crowd
Wimbledon. His service was tremendously fast, but swer
and broke as well, and like Tilden's and Patterson's of a la
day, it frequently beat his opponent outright—a feat rar
accomplished in first-class tennis today. It swept him strai
through the competition, past J. C. Parke and S. N. Dou
then at their best, with only one check when Roper Barr
took the match to five sets by sheer finesse. But Wilding
the surprise of everyone, instead of standing back to McLou
lin's service, stood up to it, and after a few failures, seemed
send it back harder the harder it came at him. It was a gr
battle, possibly one of the greatest Wilding ever fought. Ro
Barrett and C. P. Dixon beat the crack German players Ra
and Kleinschroth for the Men's Doubles, while Mrs. Lamb
Chambers, returning after a year's absence, once more won
Ladies' Singles quite easily. The prestige of British tennis
retrieved.

The year 1914 has been very rightly called "Brook
year." Brookes had not been at Wimbledon since 1907 wh
he won his second championship, and there was a good deal
speculation as to whether in view of the improved standard
play he would be able to hold his own. On this occasion
international element was less prominent as the Americ
champion, R. N. Williams, was not competing, but in any ca
judging by form, it is doubtful if he could have beaten Brook
The English players were largely what were coming to be term
"the old guard." Their skill was waning, and it was left to
German, Fritzhein, to give Brookes the most stubborn contes
It was touch and go all the way through the fifth and decidi
set, but the old champion's steadiness and generalship pull
him through. Wilding won the doubles in company wi
Brookes, and, once again, Mrs. Lambert Chambers proved th
she had no really dangerous rival among the women.

G. L. Patterson.—The years of the World War saw litt
championship lawn tennis, even in those countries which we
not directly involved. In America R. N. Williams, W. M
Johnston and Maurice McLoughlin shared the highest honours

, even there, in 1917, there was no competition. But as soon the War was over there was a vigorous revival and a real inning of a world-wide competition. The year 1919 saw ny newcomers with many new styles, but perhaps the most able was the Australian, G. L. Patterson, one of the most ceful players ever seen on a tennis court. His style was not ike that of Maurice McLoughlin, and his fastest service was ost untakable. He depended on it very largely, but, as was wn in the following season, he had weak points of which vantage could be taken once the fierceness of his first onught was checked. In the final he beat A. R. F. Kingscote, English international. In 1919 Mlle. Lenglen beat Mrs. mbert Chambers.

ilden and the "All Court" Game.—In 1920 William T. den, probably the greatest player the world has ever known, de his first appearance in this country, and defeated Patterson, holder of the championship. He was the first American mpion. There was a notable feature about Tilden's victory, indeed about the play of all the Americans. For some e lawn tennis, although increasing in speed, had, in the nion of many of the best judges, been declining in skill and esse. There had for some time been a reign of the serving volleying specialists, but Tilden and his compatriots ught back to England what is known as the all-court game. is tradition, which demands that a player shall be master of ry shot, was first laid down by Renshaw, and Pim, Baddeley, Dohertys and Wilding strengthened it. The ascendancy of all-court game was completed by the victory of Williams and rland in the Men's Doubles.

In 1921 lawn tennis became still more a cosmopolitan game d there was a large increase in the entries for the World ampionship from European countries. The meeting was morable for the contest between Tilden and a young South rican, B. I. C. Norton. The brilliant promise which the latter d shown was naturally gratifying to British spectators, for re had been no British Singles Champions since 1909, only e British finalist in the All-comers since 1912, and no British ly champion since 1914. It was true that Lycett and that remarkably versatile sportsman Max Woosnam had won the Doubles Championship, but this was the only honour which the Empire held, save Lycett's further participation in the Mixed Doubles honour with Miss Ryan. Tilden, although ill, insisted on playing, and almost paid the penalty. The first set opened rather tamely, with Tilden leading, but suddenly Norton blazed out and took the set 6–4. He followed this up by winning the next set 6–2, and the defeat of the champion seemed inevitable. Then there came an inexplicable collapse. Norton lost the next two sets 6–1, 6–love. Nevertheless even then he was able to keep the issue in doubt to the last, and twice was within a stroke of victory and the world championship before he lost the final set, 7–5.

The New Wimbledon.—The New Wimbledon was opened in the following year (1922). The title "world's championships" was dropped, the meeting being now designated simply "the championships." The fact that there were no American entries in 1922 was erroneously attributed to this change. But if there were no Americans there were worthy challengers from Australia. Patterson, the ex-champion, J. O. Anderson and P. O'Hara Wood were a trio of Australia's best and figured in everything until the finish. Patterson, who had seen the wisdom of playing an all-round game, beat Lycett in the championship, but Lycett had his revenge when, in one of the greatest Men's Doubles matches ever fought, he and Anderson, after looking hopelessly beaten, snatched a glorious victory from Anderson's compatriots Patterson and P. O'Hara Wood. Miss Ryan and Mlle. Lenglen won the Doubles, for the fourth year in succession. The latter won the Ladies' Singles, her opponent in the final round being Mrs. Mallory.

An American Year.—America was supreme in 1923. Not only did she win the Davis Cup again, with comparative ease, but also, sending her players over to Wimbledon without the assistance of Tilden, won the championship with W. M. Johnston, while another American, F. T. Hunter, was Johnston's opponent in the final. There was also in Europe in 1923 an American player, Vincent Richards, barely 20 years of age, who certainly had all the promise of becoming as great a champion as his tutor, Tilden.

Winners of the Championships at Wimbledon, 1911–26

Year	Gentlemen's Singles	Ladies' Singles	Gentlemen's Doubles	Mixed Doubles	Ladies' Doubles
911	A. F. Wilding	Lambert Chambers	M. Decugis and A. H. Gobert		
912	A. F. Wilding	Larcombe	H. Roper Barrett and C. P. Dixon

926	J. Borotra	Mrs. L. A. Godfree	H. Cochet and Z. Brugnon	L. A. Godfree and Mrs. Godfree	

Borotra and Lacoste.—The fact that the Olympic games were taking place in Paris a fortnight after Wimbledon, contributed to make the international entry of 1924 one of the greatest in the history of the championship. For the first time the device of "seeding the draw," as it is called, was adopted. Under the old system it was quite possible that, if, say, America's four best players had entered for the championship, their names might come out of the hat one after the other, in which case two would disappear in the first round and one more in the second. This luck of the draw imposed great hardships on players who might have travelled some 6,000 miles to try their luck, and it was decided, internationally, that overseas associations might nominate not more than four players in singles, or four pairs in doubles, as representative players, and that these players should be drawn in four separate quarters of the draw. Smaller numbers were treated proportionately and the result proved excellent. Of course it was still possible that the two best players of two different countries might meet in the first round but that in fact did not occur.

Washer, the hard-hitting Belgian international, disposed of Brookes in the fourth round, and then, in "the last eight" were left Lacoste (France), Washer (Belgium), Williams (America), Kingscote (England), Borotra (France), Richards (America), Raymond (South Africa) and Washbourn (Africa). For the first time two Frenchmen, Jean Borotra and Rene Lacoste, appeared in the final. Borotra's brilliance, on this occasion, triumphed over Lacoste's steadiness, although in the remarkable repetition of that final, for Borotra and Lacoste were to meet again for the title in 1925, the result was reversed in unmistakable fashion. America shared a similar honour in the Men's Doubles, Vincent Richards and F. T. Hunter winning over their fellow countrymen R. Williams and W. Washburn. Owing to illness, Mlle. Lenglen, who should have met the English champion, Miss K. McKane, in the semi-final, was obliged to retire. Miss McKane met Miss Helen Wills, the young player from America of whom much had been heard. After looking almost hopelessly beaten at one time, the English player pulled the game out of the fire and scored a brilliant victory. On the other hand, with the aid of Mrs. Wightman, Miss Wills carried off the Ladies' Doubles, beating Mrs. Covell and Miss McKane. Miss McKane finally held a doubles championship, for, with the English international J. B. Gilbert, she won the Mixed Doubles.

The year 1925 may be claimed as French. Lacoste met and beat Borotra, the champion, in the final, while Borotra and Mlle. Suzanne Lenglen won the Mixed from de Morpurgo and Miss Ryan. Mlle. Lenglen and Miss Ryan got back the title of Doubles Champions which they had held together for so long. French players also did well in 1926, although Mlle. Lenglen was obliged to withdraw. (S. L.)

LAWRENCE, DAVID HERBERT (1885–), British novelist, was born at Eastwood, Nottinghamshire, Sept. 11 1885, and educated at Nottingham High School and University College, Nottingham. With his first books, *The White Peacock* (1911), *The Trespasser* (1912) and *Sons and Lovers* (1913), it became evident that a writer of great force and originality was rising in the younger generation. A police prosecution of *The Rainbow* (1915) seemed for a time to check Lawrence's fertility, but he issued *Amores*, poems, and travel impressions, *Twilight in Italy*, in 1916, further poems, *Look! We have Come Through!* in 1917, and another novel, *The Lost Girl*, 1920. Hereafter Lawrence's outlook and style were being deeply influenced by a study of psychoanalytical doctrine and by travel in Italy, Sardinia, New Mexico and Australia: a new note is evident in *Women in Love* (1921), *Aaron's Rod* (1922), *Kangaroo* (1923), *The Ladybird* (1923), *England, My England!* (1924), *St. Mawr* (1925) and *The Plumed Serpent* (1926). Miscellaneous writings include *Sea and Sardinia* (1921), *Psychoanalysis and the Unconscious* (1921), *Fantasia of the Unconscious* (1922), *Studies in Classic American Literature* (1923), two plays, *The Widowing of Mrs. Holroyd* (1914) and *Touch and Go* (1920). He wrote also a historical study, *Movements in European History*, which was issued as by "Lawrence H. Davison" in 1921, and under his real name in 1925.

LAWRENCE, THOMAS EDWARD (1888–), British expl and scholar, was born in Wales Aug. 15 1888, of a Leicesters family one branch of which had moved to the neighbourhoo Dublin and thence to Oxford. The second of five brothers, was educated at the Oxford High School and at Jesus Coll Oxford, where, in 1910, he took a first class in modern hist In order to study Crusading architecture he made in that yea tour through Syria on foot; and the colloquial Arabic, which then picked up, and his interest in and knowledge of archaeolo commended him to D. G. Hogarth, who was about to lead expedition to Jerablus on the Euphrates and excavate the sit Carchemish for the British Museum. Thither Lawrence wen 1911, helped by a postgraduate endowment at Magdalen Coll and at Carchemish he worked on and off till 1914, taking seve opportunities to explore Syria and Mesopotamia in native co pany, and accepting for a few weeks an appointment under Palestine Exploration Fund, which attached him to the Surv of North Sinai carried out by Col. Newcombe, R.E., for the W Office in the winter of 1913–4. Though naturally inclined scholarship and letters, he showed singular practical ability a capacity for leadership, and a remarkable power of inspiri confidence in Arabs.

On the outbreak of the World War, Lawrence, being bel standard height, obtained at first no more active service tha post in the geographical section of the War Office. But so after Turkey had joined the Central Powers he was sent by Lo Kitchener to Egypt and attached to a rudimentary Milita Intelligence Section. He was a moving spirit in the negotiatio leading to an Arab revolt and in the organisation of the Ar Bureau which, as finally constituted early in 1916, acted as st and intelligence office for the Arab campaigns. In the autum Lawrence, feeling that stalemate would ensue if closer liais between ourselves and the Arabs were not contrived, ask leave to go down to Jidda; and once there, was transferr definitely from military control to the Arab Bureau which w under the Foreign Office. Hearing good accounts of the Em Faisal, he persuaded Sharif Hussain to let him go inland and vis the force which had been driven back from Medina. He so won the confidence of Faisal, and induced him to reorganise h army and move North so as to threaten the communications Medina by attacking the Hejaz Railway. When his chief w established at Wejh, and the army of another brother, 'Abdul had been brought to Wadi Ais to co-operate, Lawrence rode into the interior to raise the northern tribes, and so extend t area to be held and defended by the Turks. He pushed right to and beyond Ba'albek, *i.e.*, far behind the enemy lines in Syri and on his return, having picked up a Huweitat force under t famous raider, Auda Abu Tayyi, he routed a Turkish battalio near Ma'an, and forced a passage to 'Aqaba which was occupie for Faisal in Aug. 1917. For this exploit he was promoted field rank and given decorations, British and French, whic however, he would not accept.

Lawrence, now cordially helped by General Allenby, prompte the successive forward moves made by Faisal's force, after 'Aqab had become its base, and himself organised and led a battle i Wadi el-Hesa, near Esh Shobek, in which the enemy suffered hi worst defeat in the open. He turned his attention in particula to train-wrecking and had such success that Medina becam virtually isolated, and a large reward was advertised for th capture of "El-Orens, destroyer of engines." Early in 1918 h made a desperate attempt to cut the Turkish Palestine army's railway communication with Damascus, and failed only by a hair's breadth. In that summer, in concert with Allenby, he induced Faisal to move up to Qasr Azraq and organise a new force to advance on Damascus. This duly moved up in the autumn side by side with Allenby's thrust and after breaking up the enemy's trans-Jordan army, entered Damascus som hours ahead of the British. Lawrence took charge of the city till Allenby could reach it, and suppressed attempts at reaction.

Called to the Peace Conference, Lawrence became one of its outstanding figures during the spring of 1919. His legendary fame as organiser and inspirer of guerilla tactics was enhanced by

forcible part that he played when Faisal, whom he had
npanied on a British tour, came to Paris. But fight as
ence might against French plans for Syria, he could not
ail in that milieu, and at last, retiring to his tent, he sat down
rite the narrative of his adventures. The first manuscript
subsequently lost; but he began again, and, after many
nsions, it was announced that the book, under the title *The*
s Pillars of Wisdom, would be issued in 1926. He was
ed a Research Fellow of All Souls, Oxford, in 1919, and
ed there for a year, but without much share in the college
In 1921 Mr. Winston Churchill called him to the Colonial
e as Adviser on Arab affairs, in which capacity he had a
share in making Faisal King of 'Iraq. But, disgusted with
failure of the Allies to fulfil adequately what he considered
moral obligations to the Arabs, and remorseful for the part
imself had played in leading them on, Lawrence abruptly
Government service in 1922 and, abjuring all official rank and
rations and even his surname, enlisted as a mechanic in the
al Air Force. Thence in 1923 unwelcome publicity drove
to hide in the Tank Corps; but, in 1925, he was re-trans-
ed to the R.A.F., still as a mechanic, this being the only grade
he would accept. (D. G. H.)

AWSON, VICTOR FREMONT (1850–1925), American editor
philanthropist, was born at Chicago, Ill., Sept. 9 1850, the
of Iver H. Lawson, a Norwegian immigrant, and educated
hillips Academy, Andover, Massachusetts. He took charge
is father's interest in *The Daily Skandinavian*, and in July
5 bought an interest in *The Chicago Daily News*, which had
1 organised six months before by Melville E. Stone as the
one-cent newspaper in the West. It was a four-page five-
mn daily. In 1881 Lawson and Stone started a morning
ion called *The Chicago Record*, since discontinued. In 1888
son bought Stone's interest, and remained sole proprietor
il his death, Aug. 19 1925. His principal achievement was
development of *The Chicago Daily News* as a powerful news-
er with cultural influence; to this end he divorced politics
news; supported non-partisan organisations for investigating
tical candidates; maintained free public lectures; developed a
e-spread foreign news service, and established *The Daily*
s fresh-air fund sanatorium for sick babies. His advocacy of
ostal savings bank caused him to be called the father of the
establishing such a bank.

awson supported Stone in his development of the Associated
ss, of which he was president from 1894 to 1900, and a direc-
until his death. In 1923 the University of Michigan, and in
4 Columbia University, gave him the degree of doctor of
s. He aided numerous colleges, hospitals, churches and
ools; by the terms of his will his estate benefited, among
ny others, the Chicago Congregational Missionary and Ex-
sion Society, The Young Men's Christian Association of
cago, The Chicago Theological Seminary (Congregational),
International Committee of the Young Men's Christian
ociation of New York City, Northland College, Berea Col-
e and the Northfield, Conn., schools. (H. H.*)

AZAREV, PETR PETROVICH (1878–), Russian physi-
, was born in Moscow April 1 1878. A doctor of medicine of
scow University, he did research work in science at Stras-
rg and in 1907 was appointed *Privatdozent* in physics and
istant to Prof. P. N. Lebedev at the University of Moscow.
1912 he became professor at the technical college in Moscow,
l in 1917 member of the Russian Academy of Sciences and
ector of the research institute of physics and biophysics in
scow. Lazarev's early investigations were in photochemistry;
showed by experiment that the velocity of photochemical
ctions is proportional to the absorbed energy and does not
end on the wave length of light. Another series of his investi-
ions is in molecular physics. His main work is on the funda-
ntal problem of biophysics—the stimulation of living matter.
s ionic theory of stimulation explains the process of senses and
muscular contraction and forms the basis of his theory for the
ctions of the central nervous sytem. In 1918 Lazarev became
d of the geophysical survey of the Kursk Magnetic and
Gravimetric Anomaly. Some of his papers have been published in French (*Comptes rendus de l'Académie*, 1923–4) and in English (*Science, Lancaster, Pa.*); *Jour. of General Physiology* (Baltimore, 1924).

LEACOCK, STEPHEN BUTLER (1869–), Canadian author and economist, was born at Swanmoor, Hants., Dec. 30 1869 and went to Canada at the age of six. He graduated at the University of Toronto and became a master of modern languages at Upper Canada College, where he remained 1891–9. The next four years he spent in the graduate school of the University of Chicago, where he took the degree of Ph.D. In 1903 he was appointed to the staff of McGill University, Montreal, becoming professor of political economy in 1908, and subsequently head of his department. In 1907–8 he made a tour of the British Empire, lecturing on Imperial Organisation under the auspices of the Cecil Rhodes Trust. His serious work includes biographies of R. Baldwin and La Fontaine in the "Makers of Canada" series; *Elements of Political Science* (1906); and *The Unsolved Riddle of Social Justice* (1920). It was as the author of a number of delightful short stories, parodies and skits, however, that Prof. Leacock became most widely known to the general public. His humourous works include *Literary Lapses* (1910); *Nonsense Novels* (1911); *Sunshine Sketches of a Little Town* (1912); *Behind the Beyond* (1913); *Arcadian Adventures with the Idle Rich* (1914); *Moonbeams from the Larger Lunacy* (1915); *Further Foolishness* (1916); *Frenzied Fiction* (1918); *Winsome Winnie* (1920); *My Discovery of England* (1922); and *The Garden of Folly* (1924).

LEAD (*see* 16.314).—The principal lead producing countries in the world are now the United States, Spain, Germany, Australia, Mexico. Other important producers are India, Canada, Italy and Poland. Russia and China possess deposits of ore which, adequately worked, would yield a very large output, but at present their production is quite small. The United States has widely distributed deposits, and an output of at least four times that of any other country. The magnitude of her reserves, moreover, ensure her retaining this eminence for many years. The home market, however, consumes practically the whole of her production, the export being almost negligible.

Spain ranks second to the United States as a producer of ore, and, with Australia, is the largest exporter in the world. The principal German lead mines are in Upper Silesia, which, before the War, produced about half the ore smelted in the country, the balance being imported. Other deposits occur in Saxony, Nassau, Westphalia and the Black Forest. In Australia, the largest part of the output comes from Broken Hill, New South Wales. Before the War 50% of the production was shipped for smelting elsewhere, Germany being the principal buyer. Since the War, however, Australia has done her own smelting at Port Pirie (S.A.) and Cockle Creek (N.S.W.). Mexico has large quantities of lead ores, but disturbed conditions and inadequate communications militate against production in proportion to the country's resources. She has, nevertheless, a large output. The principal mines are situated in the northern and central states. The following table gives the production of lead ore of the countries mentioned in the years 1921, 1922 and 1923:—

Country	1921	1922	1923
	long tons	long tons	long tons
United States	370,081	426,458	487,135
Spain	133,677	117,484	125,465
Germany	36,500	39,400	27,500
Australia	83,878	151,929	171,857
Mexico	59,540	108,681	153,217
India	47,300	56,400	68,900
Canada	29,768	41,655	49,658
Italy	14,796	15,083	21,153
Poland	580	7,106	15,000
Russia[1]	1,500	2,000	2,000
China[1]	2,000	2,500	2,000

LEADER, BENJAMIN WILLIAMS (1831–1923), British painter (*see* 16.320), died at Burrow's Cross near Guildford, Surrey, March 22 1923.

LEAF, WALTER (1852–), British banker and scholar, was born at Norwood, London, Nov. 26 1852. Educated at Harrow and Trinity College, Cambridge, he graduated as senior classic in 1874, and in 1875 was made a fellow and in 1920 honorary fellow of his college. In 1877 he entered the firm of Leaf, Sons and Co., becoming in 1888 chairman of Leaf and Co. Ltd. Later he became chairman of the Westminster Bank. Leaf was one of the founders of the International Chamber of Commerce, of which he was elected president in 1925. In 1918–9 he was chairman of the committee of the London clearing banks, and from 1919 to 1921, president of the Institute of Bankers. His scholastic attainments were recognised in his presidency of the Hellenic Society and the Classical Association. Among his classical works are *The Iliad* (1886–8, 1900–2), with English notes and introduction; *Companion to the Iliad* (1892); *Troy, a Study in Homeric Geography* (1912); *Homer and History* (1915); *Little Poems from the Greek* (1922); and *Strabo on the Troad* (1923). In 1882 he collaborated with Andrew Lang and E. Myers in a translation into English prose of Homer's *Iliad*.

LEAGUE OF NATIONS.—The Covenant of the League of Nations, incorporated in the Treaty of Versailles and the other Treaties of Peace in 1919, was perhaps the most remarkable of all the direct results of the World War. For the text of this document *see* COVENANT. (*See* also EUROPE; SECURITY).

I. ORIGINS AND FOUNDATION

The League of Nations may be regarded as a necessary result of the development of human society in political organisations. It is not an abnormal achievement of human idealism—a great leap in advance beyond the achievements of the present age, outstripping the practical needs and requirements of the world. On the contrary, it is a practical method for achieving practical ends which are of importance to every citizen of every country. The demand for an international organisation to prevent war has often been made in the last four centuries. Fundamentally, this demand is that the relations of States shall be subjected to something analogous to the system of law and order to which men have subjected themselves within the smaller units in which they live. It is one example of the truth of the maxim of the Roman lawyers—*ubi societas ibi lex*. But the purpose and the content of the rules for the conduct of their relations—the *lex*—necessarily depend on the nature of the units of the society and on the nature of their relations.

When Grotius wrote his famous work on the Law of Nations, he was writing of a Society of States whose intercourse was disturbed by the continual outbreak of war. Indeed, Europe had been convulsed by the Thirty Years' War for a whole generation prior to the publication of his work. Thus it was natural and indeed inevitable that the rules which Grotius produced for the guidance of the Society of States, as he knew it, amounted to little more than a code of laws for the better conduct of war. He did, indeed, sketch the outlines of a law for the pacific relations of States, and, in the following century and a half, his successors developed to some extent what he had begun. But only after the Napoleonic wars was the first serious attempt made to establish an organised system of conducting international affairs with a view to the avoidance of war.

To Alexander of Russia's scheme of a holy alliance we need only briefly allude. Though admirable in intention, it was rejected as "sublime nonsense and mysticism" by Cast reagh, and it eventually degenerated into a mere prop of desp ism supported by the empires of Central Europe and Fran But the work of Castlereagh himself is worthy of closer att tion. He tried to substitute for the chaotic political methods the past a system of diplomacy by conference, confining efforts, however, to the Great Powers, though he desired to ma their attitude to the smaller Powers one of "influence rat than authority." He provided his "Conference of Ambas dors" with an organised plan of work and with a secretari and he supplemented it by occasional conferences of the pr cipal statesmen of the Concert. His conference of ambassad continued to sit in one form or another for almost six years, a he held four or five of his conferences of principal statesmen.

The European Concert.—Later in the 19th century, Cast reagh's work bore fruit in the European Concert, which prov on many occasions to be an effective instrument for the joi settlement of Balkan problems and for the maintenance European peace. But at the time, and for the purpose for whi he had created it, Castlereagh's system of diplomacy by co ference almost completely failed. It did so because it never h in it the seeds of life. Its members differed fundamentally on the greater issues of international politics—while some of the were independent and autocratic sovereigns, subject to no co trol, and without the pressure behind them of a general dem cratic will for peace. It could truly be said that internation society was not ready for such schemes.

Since the Napoleonic wars, however, forces have been at wo which have changed the economic condition of the world, kni ting its many parts together, and making possible a permane international political organisation. The first of these forces the revolution in communications in the course of the last ce tury, which has brought the most remote parts of the wor nearer to each other than neighbouring towns were 100 yea ago. The second of the forces—a result of the first—is the r markable raising of the standards of civilisation through th co-operation of mankind in ever larger groups and in enterpris conceived and conducted on an ever greater scale. To-da much of the world's commerce is international, and it has b come evident that the interests of any one civilised country a indissolubly bound up with those of every other country, s much so that no sensible statesman will ever again base h policy on the principle that his country will gain by anothe country's loss.

Nor is this community of interests between peoples confin to their material well-being. It extends to every sort of scie tific, political and moral activity in which men co-operate f the progress of their race. On the other hand, revolution communications, rapidly destroying the factors of space an time, has rendered possible a development of warfare which ha changed its whole character and rendered it universal an destructive in a sense never hitherto imagined. Indeed, it is no too much to assert that another World War would almost cer tainly throw mankind back into the dark ages. For these, amon other reasons, some sort of international organisation for th conduct of the relations of States was, in 1919, essential, if the human race was not to abandon the hopes and the ideals fo which it had striven during centuries of progress.

ESSENTIAL CONDITIONS OF A LEAGUE

With the reasons for the failure of the earlier scheme of a century before, and with the nature of modern national States in our minds, we can perhaps now proceed to lay down the essentials of a league of nations.

It may be taken as commonly accepted that the purposes and objects of a league are the following: first, the maintenance of peace; second, and as a corollary to the first, the solution of international disputes by methods of law, if and when the necessary law exists; when it does not, their solution by political methods, by public debate, by impartial investigation and by conciliation on the basis of the accepted canons of right and justice; third, the promotion of international co-operation rever necessary or useful, between States and between the ens of different States. The promotion of such co-operation imply the development of rules and the general acceptance common machinery and common practice in ever wider eres of international activity.

urther, a first principle which must be borne continually in d is that the fundamental basis of all law, and the primary dition of all political organisation, is the consent of those who to obey it. And an important and relevant corollary of this position is that the force, even the united force, of the ater or more powerful members of a society cannot in the run coerce the will, or replace the consent, of the others. It seless, therefore, to plan any organism which depends on the operation of the powerful States, but which will not also ive the willing acceptance and co-operation of the great y of other States.

n examination of the results of these limiting conditions, of the lessons to be drawn from historical experience, and he accepted objects which it is desirable that a league should ieve, will indicate the minimum of rules and of machinery ch is essential.

embership.—In the first place, then, there must be rules ing down the conditions of membership of the League. As members of the League, in order to carry out the objects ich they agree upon, must give reciprocal undertakings, they st have some guarantee that those with whom they associate mselves are willing and able to carry out what they promise. xt, it is essential that all the members should enter into agree- nts to meet in conference from time to time. Third, it will in ctice be necessary that there should be some smaller organ n the full conference of all the members, which in the current siness of the League, and when executive action is required, act for and represent the whole. It is evident that the com- sition of such an executive organ will—in a society in which mbers are so unequal in size, population and power—involve st difficult problems of representation such as those that se in 1926.

ecretariat.—A further consequence of any attempt to organ- international affairs through regular conferences of all the mbers of the League, and through a smaller executive organ, he necessity for a secretariat which shall be charged with the ty of preparing the work of the organs of the League, which ll act as a central exchange for information among members d shall organise the central and technical services. The secre- iat would also have to keep the records of the League, super- e the execution of the League's decisions, and in general act an organising agency for the promotion of international co- eration. It is, perhaps, theoretically possible that these duties uld be fulfilled by means of national secretariats attached to representatives who compose the full conference or the cutive organ of the League; but there are great practical vantages in an international secretariat whose members are lividually independent of national governments.

The above represents the minimum machinery that is essential the effective working of any league. We must next consider minimum mutual obligations which the members of the ague must assume if it is to prove an effective instrument for maintenance of peace.

Peaceful Settlement of Disputes.—It is evidently essential that ery member must agree that it will not go to war with any er member without previously submitting the dispute to aceful methods of settlement. Further, and as a corollary to s first undertaking, there must be a second one providing for nmon action against members who break this fundamental eement. What the nature of this common action must be is a tter for discussion; but it must at the least provide for united d energetic moral pressure by the whole body of the League ainst the recalcitrant member. It may well be argued that in world as it is to-day this united moral pressure should be pported in whatever way may be possible by united material essure as well. What in any case is essential is to find some ans of bringing home to every citizen of a member which breaks its League agreements the universal disapprobation of the other members. Thirdly, it is practically, if not theoretically, necessary to lay down in advance, some method, or methods, for the settlement of disputes by peaceful means.

Great elasticity may be left as to the nature of these methods, and as to the choice of method which the parties to a dispute may adopt. But the agreements of the League should include plans for settlement by conciliation, or arbitration or judicial verdict; and these plans should be based on the essential principles by which alone moral pressure can be brought to bear on individuals or on Governments—that is to say, on strictly impartial inquiry into the merits of disputes, and on full publicity for the contentions of the parties and for the proceedings by which settlement is attempted.

It is further essential that the agreements of the League should include the automatic abrogation by members of all treaties or undertakings which are not consistent with their obligations as members of the League. No general organisation, such as a league of nations, can operate or inspire confidence in its members if the undertakings to which they agree by their membership are overborne or superseded by other inconsistent agreements which they may enter into with individual States.

The organisation and the undertakings indicated seem to constitute the minimum that can serve as the basis of any effective international organisation for the prevention of war. Beyond this minimum, there are other things not absolutely essential but highly desirable. For example, judicial verdict implies a court of international law. It is true that such a court might be set up *ad hoc* for any dispute in which it is required, but it is far better that a permanent court should be established as part of the machinery of the League. Such a court, indeed, appears to be a necessity if we are to achieve the development of international law as an increasingly important factor in the relations between States.

Again, it is highly desirable, though it is not theoretically essential, that the agreements of the League should provide that any dispute, or any circumstances affecting the peace of the world, should be a matter of general concern to every member, so that any member may be within its right in demanding the consideration of any such matter by the organs of the League.

Interdependence of States had so far advanced during the course of the 19th century that this principle received some slight and tentative recognition in the conventions for the peaceful settlement of international disputes drawn up by the conferences at The Hague. But the principle needs full recognition and application if countries are to be prevented from drifting into armed conflicts which in these times will certainly involve the interests of their neighbours.

And lastly, it is desirable, though again not essential, that the League should be given the necessary powers to enable it to act as the co-ordinating agency for the international activities of its members in all the multifarious spheres hitherto governed by international bureaux, by general treaties and by other forms of official and unofficial co-operation.

The Essential Provisions of the Covenant

Impartial consideration of the Covenant will show that it embodies every one of the features which have been enumerated as the essentials of an effective league. It may further be said that where it goes beyond the essentials it does so in a way which was intended to make, and does make, for greater completeness and efficiency.

Membership.—Article 1 of the Covenant consists of the rules of membership. It stipulates that the original members of the League shall be the signatories to the Covenant and such other States named in the annex thereto as shall accede to it without reservation; and that any fully self-governing State, dominion or colony may become a member if its admission is agreed to by two-thirds of the members and provided that it shall give effective guarantees of its sincere intention to observe its international obligations and shall accept the regulations of the League in regard to its military forces. These rules constitute a statement of the principles concerning membership that are essential if the members of the League are to have confidence that their mutual undertakings will be carried out.

Representation.—With regard to agreements to meet in conference, Articles 2, 3 and 4 of the Covenant stipulate for the creation of an Assembly consisting of three representatives of each member of the League, and for a smaller Council consisting of representatives of four great Powers and of four smaller ones. The Covenant does not lay down the intervals at which these bodies shall meet: it merely stipulates that the Assembly shall meet at stated intervals and from time to time as occasion may require; and that the Council shall meet in the same way, and at least once a year. It leaves these questions to be dealt with in whatever rules of procedure the council and the assembly might respectively consider it wise to adopt.

The question of representation of the members at the assembly was one which naturally involved serious difficulties. It was solved by according to every member an equal right to send three representatives.

The question of representation on the Council was still more difficult. A definite preponderance of influence in international affairs had been accorded prior to the World War, to the Great Powers of the world. It was inevitable, and right, that the Great Powers who are members of the League should be given permanent representation on its principal executive organ. The representation of the smaller Powers—an exceedingly difficult matter—was dealt with by providing that the four non-permanent members of the Council shall be selected by the Assembly from time to time in its discretion.

Articles 6 and 7 provide for the necessary secretariat, and for the nomination of a secretary-general, who shall make all the appointments to the staff with the approval of the Council. These articles also provide that every position in the secretariat shall be open to women. So much for the institutional organisation of the League as it was established by the Covenant.

Disputes.—With regard to the agreements not to resort to war, which are included above, among the essentials, the Covenant embodies almost everything that any responsible authority had in 1919 advocated as practicable. By Article 12 the members agree that if there should arise between them any dispute likely to lead to a rupture, they will submit the matter either to arbitration or to inquiry by the council, and they agree that they will in no case resort to arms until three months after an award has been made by the arbitrators or a report has been made by the council. Article 12 thus not only embodies an agreement not to go to war without previous recourse to peaceful methods of settlement for disputes, but also lays down two alternative procedures by which, through the agency of the League, settlement can be effected. The first is ambiguously referred to as " arbitration," but it is evident from Articles 13 and 14 (the latter of which provides for the establishment of a permanent court) that the use of the word " arbitration " is a loose one, and that what is really intended is recourse to legal decision. These two articles, indeed, leave great elasticity, but their purpose was to secure the establishment of a permanent court of international law to which the parties should in the normal course take disputes of a legal nature.

There is, moreover, at the end of Article 14, a clause designed to increase the value of the permanent court. This clause provides that the court may give an advisory opinion upon any dispute or question referred to it by the Council or by the Assembly. Thus, if a litigant should bring to the League a dispute in which it believes the law to be on its side, it will be able to demand, even if the other party does not agree, that the Council shall secure on the juridical questions at issue an advisory opinion from the court; and the court, in rendering this opinion, will give the Council the elements for a decision which would have all the force of a legal verdict. Thus the Covenant included provisions which went far towards securing that all international disputes of a genuinely legal nature shall be determined by legal methods.

With regard to the other alternative method provided for the settlement of disputes, which members agree to by Article 12, that is to say, inquiry by the Council, Article 15 lays down in considerable detail the procedure which is to be adopted. It provides that any party to a dispute can oblige the League to take cognizance of it by giving notice to the secretary-general. The parties undertake to communicate to the secretary-general as promptly as possible statements of their case, with all the relevant facts and papers. The Council is then given discretion to endeavour to effect a settlement of the dispute, and it is provided that if its efforts are successful, a statement shall be made public giving such an account of the dispute and of the settlement arrived at as the council may deem proper. If the council fails to settle the dispute, it is to make a report setting forth the merits of the dispute and the recommendations which the Council thinks would be suitable for a settlement, and this report is to be published. A report may be made either unanimously or by a majority vote, and any individual member of the League which is represented on the Council has a right to make its own public statement concerning the dispute.

There is a further provision in Article 15 to the effect that if such a report is agreed to by the Council unanimously, with the exception of the representatives of one or more of the parties to the dispute, the members of the League—including the parties—agree that they will not go to war with any party to the dispute who complies with the provisions of the report. This is a most important additional limitation of the right of members to resort to arms. Article 15 also allows an appeal from the Council to the Assembly, provided made within 14 days after the submission of the dispute to Council. If a dispute is so referred to the Assembly, the Assembl to deal with the matter in the same way as the Council, and i report is agreed to by all the members of the League represente the Council, and by a majority of the other members of the Lea exclusive in each case of the representatives of the parties to dispute, it has the same force as a unanimous report agreed to by Council, *i.e.*, the members of the League must not go to war with of the parties to the dispute which accept it.

These Articles, then, provide two, or rather three, methods which disputes can be settled by peaceful means through agency of the League. The first provides for legal verdicts the permanent court, when such verdicts are possible and use the second for arbitration by some special tribunal agreed to the parties to a dispute; and the third, for settlement by political agency of the Council or the Assembly, in accorda with procedure based on the principles of full publicity strict impartiality. The authors of the Covenant believed t publicity would of itself ensure impartiality; that it was conceivable that a council, acting as the representative of whole body of the League and in circumstances of utmost p licity, should conduct its inquiries into a dispute in any way consistent with the strictest fairness to all the parties concern

Sanctions.—Articles 12 to 15 also make provision for the n essential of a league—united pressure by all the members agai any of their number which disregards its undertakings. In p viding for a public report by the Council on the merits of a pute and for the publication of its recommendations as t settlement, the Covenant lays down a method which, in pr tice, must exert the strongest moral pressure on any state wh in defiance of Article 12 is disposed to go to war.

But the Covenant goes beyond this, and provides in Arti 16 that, if any member of the League in contravention of agreements resorts to arms, such a member is *ipso facto* " deem to have committed an act of war against all other members the League," and the other members are obliged to prevent financial, commercial or personal intercourse between the tionals of the Covenant-breaking State and the nationals any other State. It was difficult in the disturbed condition the world after the War to realise just what would be the eff of such a complete economic and financial boycott in times normal peace. But it is not too much to say that no civilis State would, in 1914, have ventured to declare war had it be threatened by such a universal boycott as is stipulated Article 16 of the Covenant.

It is sometimes held that in providing for such a univers boycott, the Covenant goes beyond the essentials of a league. is sometimes even held that it goes beyond what is practica and wise. But it must be remembered that Article 16 only com into force if a State insists on going to war without waiting any attempt at peaceful settlement, or where an agreed tribun or a unanimous council have given a decision which has be accepted by the other party. In other cases ultimate resort war is envisaged under the Covenant as legitimate, and t obligations of Article 16 would not come into force. Inde against a genuinely recalcitrant member of the League, t Covenant goes even further. Article 16 lays down that in ad tion to the blockade which is an automatic obligation of all t members of the League, the council shall consider and sh *recommend* to the several Governments concerned, what militar naval or air forces members of the League shall severally co tribute to the armed forces to be used to protect the Covenan In other words, while leaving again the greatest possible ela ticity, the Covenant foreshadows united military action, if it necessary, against a Covenant-breaking State.

To turn to another matter, the Covenant provides by Artic 20 for the abrogation of treaties, obligations and understandin which are inconsistent with its own terms, and thus meets yet another particular, the essentials of a league.

FURTHER PROVISIONS OF THE COVENANT

How far, and in what respects, does the Covenant go beyo these essentials?

Guarantees.—First, there are the much-discussed provisions Article 10. This Article has been very generally misunder- ood. Its effect is to guarantee the members of the League *ainst external aggression* which would impair their territorial tegrity or political independence; but this guarantee is only be enforced as the Council acting unanimously shall agree. practice the protection against sudden and unjust attacks ovided by Articles 12–16 will probably be much more useful, nd, if executed, all that is required. Article 10 is really only a ther clumsy assertion that territorial or political changes shall ot be made by aggressive war. Such changes, if required, must made under Article 19, which enables the Assembly to recon- der treaties which have become obsolete or dangerous to peace.

Armaments.—Second, it may perhaps be said that, by the ovisions of Article 8 on the subject of armaments, the Cove- ant introduces something which is extraneous to an agreement preserve the peace. But the history of the 20th century has emonstrated that if you prepare for war you will have war; that crease of armaments in one country provokes increase of maments in other countries, and that if rivalry in preparation r war continues, within a certain time war will break out. The thors of the Covenant believed that unless rivalry in arma- ents could be prevented, any league of nations, however it be nstituted, would fail. They therefore thought an agreement ot to engage in unlimited competition in armaments absolutely ecessary to the peace of the world. The Covenant deals with e matter in a way which is pre-eminently practical and sane. recognises that the maintenance of peace requires the reduc- on of national armaments to the lowest point consistent with ational safety, and directs the Council to formulate plans for ch reduction for the consideration of the several members of e League. In other words, the members agree to co-operate in orking out a general international plan embodying scales in ccordance with which their armaments shall be limited or educed.

Further, the members agree that they will, through the eague, endeavour to take measures for abolishing the evil ffects of the private manufacture of armaments and material of ar, and they agree to exchange full information as to their rmaments, their preparations for war and the condition of their dustries which may be adapted to warlike purposes. Lastly, y Article 23 they agree that, subject to conventions to be rranged, the international traffic in arms, admittedly one of the inor contributing causes of war, shall be placed under the eague's supervision.

These are only general principles. In themselves they would e of small value. But it was hoped by the authors of the Cove- ant that the action of the permanent machinery of the League ould in time enable its members to give effect to the purpose of rticle 8; and that thus great strides would be made towards he disarmament which everyone desires. In this respect, as in thers, the authors of the Covenant were careful not to travel o fast; they laid foundations on which those who were to ield authority in the League could later build.

Secret Treaties.—By providing in Article 18 for the publication f all treaties, the Covenant again goes beyond essentials. Yet o reasonable man can doubt that, under the diplomatic system hich prevailed before 1914, secret treaties of alliance, directly y their mere existence and indirectly through the mistrust which hey created, were one of the serious causes of international onflict.

Mandates.—Article 22 of the Covenant introduces a new prin- iple into international affairs which is certainly extraneous to he central purpose of a league. The mandates system which it reates is a great experiment in the government by advanced eoples of backward territories and races. The main principles re simple. The Article is based on the proposition that back- ard peoples and territories are not for the future to be exploited r the exclusive benefit of those who govern them; that, on the ontrary, their interests and well-being constitute a sacred trust f civilisation and that the way in which they are ruled is a atter of interest to the world at large. The Article therefore lays down that in the government of such territories the interests and progress of the inhabitants must be the guiding purpose of the administration. The methods by which their interests are to be protected and their development secured vary, of course, in every case with the nature of the territory and the character of the people concerned. But in every case the fundamental principles are the same; and to secure the observance of them the Covenant imposes on the mandatories a duty to make annual reports for submission to a permanent mandates commission; which is, in turn, to report to the Council. Here again the Covenant relies on publicity and public opinion as a guarantee that Article 22 will be faithfully carried into effect.

International Co-operation.—With regard to international co-operation, the Covenant in Articles 23 and 24 goes a great deal further than might be considered essential. It provides in general terms for the establishment of a labour organisation (which in fact has been elaborated separately by another agreement); for the equitable treatment of commerce; for the development of freedom of transit; for League supervision of the traffic in arms; for League action in matters of public health and for the general supervision by the League of all official, and also, if necessary or useful, of unofficial, international offices established for international purposes of general interest. The general effect of these provisions is to make the League what it is clearly desirable that it should be—a central organism through which international activities of every sort can be co-ordinated and, when useful, assisted by the council and the secretariat. There can be no doubt that the result of this must be to prevent waste of effort and promote efficiency in the conduct of international business of every kind.

Amendments.—In the last place the Covenant, by Article 20, provides a method by which it can itself be amended; and this, it may be held, is not an essential of a league. It is true that the Covenant might have been regarded as an ordinary international treaty, valid, as most treaties are now made, for a certain fixed period, at the end of which it might have been renewed or changed by the ordinary methods. But it was precisely because the authors of the Covenant did not regard it as an ordinary international treaty that they provided a special means for amendment; and there can be no doubt that, morally, Article 26 is of great significance, and that practically it may prove to be of great constitutional value. It still leaves it difficult to secure amendment of the terms of the Covenant. It can only be done if all the members of the council and the majority of the members of the assembly are agreed. But the fact that amendment is definitely envisaged is in itself important.

Generally, it may be said that when the Covenant goes beyond the essential features which are necessary to any effective league to preserve peace, it does so with one of two objects in view. Either it is with the purpose of giving real life to the machinery which it establishes: of bringing the international forces actually at work into effective co-operation, in order that members of the League may be brought closer together, and the League itself be strengthened and have the vitality that comes from continuous and varied work; or else it is with the purpose of removing those deep-seated causes which public opinion has recognised as having led to war. It is not by chance that the Covenant contains more or less elaborate provisions concerning armaments, the traffic in arms, annexation by conquest, the avoidance of unfair economic competition, imperial rivalry in the exploitation of backward countries, secret treaties and alliances. It is because these things have led to war in the past that the Covenant seeks to deal with them in a practical and effective way, to the end that war may be rendered less probable in the future.

It has already been said that the authors of the Covenant confined themselves to laying down the essentials of the organisation which they considered the League required and the general rather than the detailed obligations to which they thought that members of the League must agree. Elasticity is one of the chief "notes" of the whole machinery of the League. The Council and the Assembly are free to develop their own methods and systems as they choose, to appoint committees and commissions at their discretion, and to draw up codes of procedure which they can themselves change; they are thus able to give to the general principles of the Covenant the free development which experience may dictate.

It is in pursuit of this same elasticity that in several cases the Council is charged to carry into execution plans which the authors of the Covenant felt to be essential, but which they were not themselves, for lack of time and for lack of expert technical advice, able immediately to prepare. Much valuable work has been done under these provisions.

Preparation and Enforcement

The Covenant was prepared by a special Commission of the Peace Conference of Paris, consisting of ten representatives of the Great Powers and nine representatives of the smaller Allied States. This commission, appointed on Jan. 20 1919, was a body of remarkable authority. Presided over by President Wilson, its members included Colonel House, General Smuts (later Prime Minister of South Africa), Lord Robert (Viscount) Cecil, M. Léon Bourgeois (former Prime Minister of France), M. Veniselos (Prime Minister of Greece), M. Pessoa (later President of Brazil), M. Vesnitch (later Prime Minister of Yugoslavia), M. Scialoja (later Foreign Minister of Italy), M. Hymans (Foreign Minister of Belgium) and others.

The first draft prepared by the commission, based on proposals put forward jointly by the British and American delegations, was laid before the Peace Conference at a public meeting on Feb. 14; it was thereafter amended in the light of criticisms made by the conference, by the Press and by the neutral Powers at a special meeting held for the purpose of hearing their views; and the final draft was adopted by the Plenary Conference at another public meeting on April 28. It was, on the insistence of President Wilson, inserted as Part I. of the Peace Treaties made with Germany, Austria, Hungary and Bulgaria. By this device the Allied Powers were prevented from making peace with their enemies without being members of the League.

With the entry into force of the Treaty of Versailles on Jan. 10 1920, the League of Nations came legally into existence. Prior to this date, preliminary organisation of its work had been carried on by the secretary-general under the authority of a committee of the Powers. When all the Allied Powers had ratified the Peace Treaties (except the U.S.A., Hejaz and Ecuador, who failed to do so) the members of the League numbered 29. To these were added during the course of 1920 the neutral Powers, 13 in all, who in accordance with Article I. of the Covenant acceded to it without reservation. By successive admissions of ex-enemy and other States, the number of members had by 1925 risen to 56.

(C. of C.)

II. THE WORK OF THE FIRST SIX YEARS

In order to understand what has determined the character, scope and varying efficacy of the League during the first six years of its existence, it is necessary to bear in mind both the general conditions under which, and the organisation through which, it has been working. It is only by realising these conditions that we shall understand why some of the main international problems have been dealt with by the League and some outside it; and why its success in those which it has undertaken has varied from case to case.

The first of the determining political conditions is that the process of settling the terms of peace, of resolving the immediate problems left by the World War, was only begun and not
ended by the treaties of peace signed in 1919. For years afte
wards peace was still being negotiated in every capital in Europ
One of the treaties, indeed, the Treaty of Sèvres, was never ra
fied. Renewed war between Greece and Turkey, rather t
continuation, after an interval, of one section of the World W
than the outbreak of a new one, was to precede the new Trea
of Lausanne of 1923. But even those treaties which were du
ratified left unsettled questions of the first political importanc
in the forefront " reparation " and in the second rank a host
secondary, but still difficult and important, problems.

But the task of completing and executing the terms of sett
ment between recent combatants is very different from that
permanently preserving the peace of the world. The Covena
(*q.v.*), designed to create a permanent instrument, is natural
drafted as if the immediate war problems had been settled
the treaties of peace and as if, peace and normal conditions ha
ing been established, it was the task of the League to mainta
them. The questions left unsettled directly concerned the la
belligerents, not the world as a whole. Their settlement w
essentially a corollary of the treaties and a part of the sa
work. It was natural, therefore, that they should be dealt wi
not by the new world organisation, the League, but by conf
ences of the Allies or of the late belligerents similar in compo
tion and in character to those which had negotiated the treati

Limiting Factors.—In the second place, the scope of t
League's work has been limited by the fact that, while in essen
a world organisation, it has not yet received the adhesion of
countries, and in particular three of the seven principal cou
tries of the world have during the whole period now und
review been outside its membership.

These conditions derive additional importance from the fu
damental character of the League as an organisation. T
League is not a super-state with either the right or the authori
to impose its will on the sovereign States which compose it.
is essentially an organ for securing agreement between them, a
its power of action is at any time limited by the extent of pos
ble agreement. Except in a few special cases, of which the mo
important is that members undertake not to go to war to enfor
a claim rejected by all the members on the Council except t
disputants themselves, signature of the Covenant does not i
volve an obligation on any State to accept a decision of t
League without its own consent.

For the great bulk of its work, therefore, the League requi
unanimity. It can persuade, it can elicit a collective wo
opinion, both private and official, which it may use to aid
persuasion, but, except before the imminent threat of war,
cannot compel; and even in this case unanimity of the no
disputant members of the Council is required. It follows, the
fore, that the power of the League varies with the policies a
characters of the countries which compose it and of their re
tions between each other. How far this is from involving imp
tence, how great is the difference between the policy a count
would pursue if left alone from that which it can be induced
follow under the persuasion of collective opinion, the followi
account will show. But however wide the range within whi
such persuasion can be effective, there is at any given mome
a limit beyond which a country cannot be moved. And beyo
such limits the League is, for the great bulk of its work, imp
tent. In dealing with its various problems the League has
deal with exactly the same forces and differences of policy a
interest as if they were handled by other methods of negotiatio
and the organs of the League, the Assembly, and the Coun
comprise, indeed consist of, representatives of interested go
ernments themselves.

It follows that any serious divergencies of policy betwe
members of the League, and especially its more important me
bers, will be likely to enfeeble the League for its general wo
And it is obvious that the obstinate differences on reparati
and other questions touching Germany and on Near Easte
affairs, affecting as they did for some years the general relatio
of some of the principal countries on the council, necessari
limited the League's general power and progress.

iese limiting factors have diminished in importance as the s have passed. Little by little, the specifically War problems found a settlement, the transitional instruments of nego- on, supreme councils or allied conferences or the Conference mbassadors (*see* SAN REMO; SPA; PARIS; LONDON; CANNES; OA; LAUSANNE; and LOCARNO; also AMBASSADORS, CON- NCE OF; SUPREME COUNCIL) have ended or retired to a ndary place; and the permanent organisation has come into oreground. The number of member States has risen from 2 of the first Assembly to 55, in 1925, and the improvement ternational relations which, while largely developed at va, found its expression at Locarno, has immensely added e strength of the League to deal with such future troubles ay occur.

ORGANISATION OF THE LEAGUE

ie principal organs of the League are the Assembly, meeting lly once a year and representing all States; the Council, ing usually every third month and consisting of four per- ent members (Great Britain, France, Italy and Japan—to h Germany will doubtless shortly be added)—and six non- ianent members elected by the Assembly; the permanent tariat; a whole series of special organisations and com- ees (for finance and economics, transit, health, armaments, dates, intellectual co-operation, opium, traffic in women, ; and, working independently of the Council and Assembly, permanent court of international justice, and the inter- onal labour office.

ie respective spheres of competence of the Assembly and the ncil are not exactly defined in the Covenant. Each may deal any matter within the League's competence or affecting peace of the world. In practice, the size, composition and s of meeting of the two bodies determine their functions. Assembly affords an opportunity for an annual review, by responsible representatives of the Governments of the d, of the international situation. It largely creates the osphere and determines the general lines of policy for the ing year, and it is a convenient instrument for the concluding s in the negotiations of conventions and general agreements orld interest. The Council, on the other hand, has become League's executive organ. It deals with the host of special tions that arise for settlement throughout the year, and cts the multifarious permanent tasks of the League and the ial organisations through which they are carried on.

iese special organisations are in some respects the most esting feature of the League as an administrative machine. consist for the most part of permanent committees, com- d of specialists and experts drawn either from the depart- ts of the national governments or from private institutions. e experts work normally in their own countries, and they the special knowledge of national forces and conditions, possess the national influence, which no purely international als can retain. But they meet periodically as members of gular organisation. By this system, which follows closely principles of the inter-Allied central organisation built up in ater years of the World War, the League obtains an execu- instrument more expert, more effective and more economi- han could possibly be obtained by the unaided service of its whole-time officers. It binds together the national adminis- ons of the world and forms them into an instrument of national work. More than this, it permeates with its own those who in their own countries are carrying on national which reacts on the interests of other countries.

these six years some thousands of such persons, no small ortion of those who throughout the world are forming and iting the policy which determines international relations, learnt, in regular co-operation with those of corresponding ion in other countries, the international point of view. It is a system which, apart from its direct utility, effects a peace- enetration of the League point of view into national systems. is elaborate and elastic system the permanent secretariat is initing element—the "coupling." Its importance results from the immense range and variety of the organs which it serves, and from the fact that these organs consist of councils, commissions or committees meeting periodically, not in permanent session, and consisting of persons whose main work is elsewhere, in their respective countries.

POLITICAL DISPUTES

It is the task of the League to prevent political disputes causing war. It is most successful where it has been able, by patient work in improving international relations, to remove the causes of disputes before they arise. In this wider sense most of the work of the League has a political aspect. In its mandates and minorities work, for example, the League is continually trying to establish conditions which will diminish the risks of future conflict; and in such a piece of international co-operation as the reconstruction of Hungary, the existence of political differences constituted one of the main obstacles to success, and their settlements one of its main rewards. The definite political disputes threatening to disturb international relations and, in some cases, the peace of the world, which have been submitted to the League of Nations are treated in this work under the individual headings, but something must be said here to illustrate the methods by which the League discharges its primary responsibility of preserving the peace.

Aaland Islands.—The first of these disputes was between Sweden and Finland in 1920 over the Aaland Islands (*q.v.*). Neither country appealed to the League, but as the danger of conflict increased, Great Britain brought the matter to the Council under Article 11 of the Covenant. Both countries were invited to become members of the Council for the purpose, Sweden as a member State under the specific provision of Article 4, and Finland, not then a member, by special resolution in accordance with the general spirit of Article 17. Sweden urged the strong and persistent desire of the islanders themselves for union with Sweden, and her representative declared that "if Finland . . . failed to withdraw her troops a conflict was likely to arise." Finland claimed that her legal sovereignty was indisputable and that the Council was not competent because the matter was one which by international law was solely within the domestic jurisdiction of Finland. The Council, with the concurrence of both parties, appointed a commission of three international jurists to give an advisory opinion on this point (the court of justice not yet being established), and on the basis of its report declared itself competent. It then sent a committee of inquiry, consisting of a Belgian, a Swiss and an American, to investigate on the spot and propose a settlement. In conformity with the report of the committee and after hearing the views of the islanders, as well as the Finns and Swedes, the Council, in June 1921, decided that Finland's claims to sovereignty over the islands must be recognised but that the claim of Sweden and the islanders should be met by detailed guarantees ensuring neutralisation and a large measure of autonomy. This decision was followed by a conference of 10 Powers in Oct. to frame a convention providing for the neutralisation and demilitarisation of the whole archipelago. The convention was duly ratified and came into force in April 1922. No trouble has since arisen, and the settlement appears to be accepted as final and conclusive.

Vilna (Wilno).—The next dispute marked a failure in League action. The Treaty of Versailles left the eastern frontier of Poland to be fixed later by the Principal Allied Powers. No definite frontier was fixed, but a provisional line was drawn which left Vilna (*q.v.*) in the territory of Lithuania, a newly created State. A dispute arose between Poland and Lithuania over this line, and hostilities became imminent. The Council, in Sept. 1920, sent a military commission which prevented hostilities and provisionally arranged the disposition of the respective forces. But General Zeligowski, a senior Polish officer, crossed the line and entered Vilna with a considerable force. The Polish Government repudiated his action, but refused to send troops against him. The League's military commission arrested hostilities by establishing three neutral zones between the opposing forces, and the Council proceeded to deal with the territorial dispute. They first attempted a referendum and arranged to send a small international police force to maintain order during the plebiscite. But the inflammation of public opinion made it very unlikely that a fair expression of opinion could be maintained, and this plan failed. The Council next attempted conciliation by direct negotiations between the two Governments under the presidency of M. Hymans, the Belgian member of the council. A proposal made by M. Hymans himself that the Vilna territory should be an autonomous canton within the Lithuanian State was not accepted, and the effort at direct negotiation thus failed. The council then made a formal "recommendation" in accordance with Article 15; they adopted M. Hymans' report unanimously and with the assent of the full Assembly which discussed the proposal in Sept. 1922, called upon both countries to accept it. They refused, and the League did not enforce the recommendation. Finally, early in 1923, the Conference of Ambassadors, acting on behalf of the principal Allies under Article 87 of the Treaty of Versailles, definitely fixed the eastern frontier of Poland in such a way as to include the district of Vilna within it. The *fait accompli* prevailed. The League had succeeded in averting hostilities which would otherwise have been inevitable, but it had failed to secure the adoption of its own solution on the substance of the dispute.

Upper Silesia.—The next dispute was equally difficult, and again resulted from the incompleteness of the terms of peace signed in 1919. The Treaty of Versailles provided that a frontier was to be drawn in German Upper Silesia (*q.v.*), dividing the district between Germany and Poland in accordance with the "wishes of the inhabitants" as indicated by a plebiscite and taking account of "geographical and economic conditions"—two conflicting criteria which pointed to very different conclusions. The plebiscite was held in March 1921, but neither the Plebiscite Commission, nor a committee of experts, nor the Governments composing the "supreme council" could agree as to the line to be drawn. A Polish insurrection broke out, and production in the rich mining and industrial area of the "triangle" was stopped. There was the greatest tension not only between Poland and Germany but between the Allies – France proposing a line based on the plebiscite, giving the bulk of the disputed area to Poland, and Great Britain proposing a line more in accordance with economic considerations, giving the bulk of it to Germany. Repeated and prolonged attempts to effect an agreement failed. There was rioting and, indeed, for some days, fighting between organised volunteers. Work was stopped and there was danger of a serious rupture between the Allies. Having failed to reach agreement through their normal organ, the Supreme Council, the Allies, in Aug., asked the League to propose a frontier in accordance with the treaty, binding themselves to accept any agreed recommendation. The Council met in special session on Aug. 29 and referred the problem for preliminary examination to a committee consisting of the representatives of Belgium, Brazil, China and Spain—states which had taken no part in the previous discussions.

This committee came to the conclusion that the only practicable solution was to be found in drawing such a frontier as would attribute to each country a number of inhabitants proportionate to the votes recorded in its favour, while arranging special guarantees against the dislocation of the economic life of the district for a period long enough to enable it to be adjusted to the new frontier. That is, instead of trying to determine a frontier on a compromise between the conflicting plebiscite and economic considerations, they proposed to take the plebiscite as the basis of the first and to meet the second by an appropriate economic convention. This solution was adopted by the council, and by the Allied Powers, who traced the frontier accordingly. A Germano-Polish convention, ensuring the continuity of the economic life of Upper Silesia for a period of 15 years, was subsequently drawn up in agreement by the two Powers negotiating under the presidency of a Swiss statesman appointed by the League.

This settlement was severely criticised both in Germany and Great Britain. It must, however, be remembered that the League had no authority to fix an ideal frontier line, but only to apply the treaty provisions. The whole case is an illustration of the difficulty already mentioned of the League, designed as an impartial instrument for the preservation of peace, being used to complete the terms of a peace settlement between recent combatants. But at last agreement was reached, a cause of dissension between the Allies was removed, work was resumed and rioting ceased.

Albania.—A further risk of hostilities occurred in 1921 through a delay in the definitive settlement of a frontier. Albania (*q.v.*) was admitted as a member of the League in 1920, but the frontier question was still under consideration by the Conference of Ambassadors. In April 1921 Albania called the attention of the League to encroachments on her territory by Serbia and Greece. The Council, unwilling to complicate the task of the Conference of Ambassadors by separate intervention, asked the Conference to hasten their decision and called on the three countries to abstain from any hostile action. The question being still unsettled in Sept., however, the League appointed a committee of three impartial persons from Luxembourg, Norway and Finland to report on the situation. Before its arrival in Nov., however, Yugoslav troops entered the Mirdita district of Northern Albania. There was heavy fighting, and the defeat of Albania was almost complete. The British Govt. at once demanded the summoning of a special meeting of the Council under Article 11 to consider the situation and if necessary to agree upon measures under the "sanctions" article, No. 16, of the Covenant. At the meeting of the Council on Nov. 18, the Serb-Croat-Slovene State agreed to evacuate its troops and to respect the frontier which had now been definitely fixed by the Conference of Ambassadors. The League Commission of Inquiry personally accompanied the departing troops, and on Dec. 10 were able to report that the evacuation had been successfully completed without untoward incidents. A serious threat of conflict had again been averted and has not since recurred.

Memel.—The Memel problem is another instance of a peace treaty question handed over to the League because the Allies, acting through their normal machinery, had been unable to settle it. There was a strong reason for invoking the services of the League in this case because it involved extremely complex technical question transit and port facilities, with which the League's technical org sation was particularly fitted to deal. Lithuania, having suff from a *fait accompli*, pending the definite fixing of a frontier Wilno, successfully tried a coup of her own at Memel in Jan. 1 The Conference of Ambassadors fixed the frontier in a way which Memel in Lithuania on condition of a large measure of autonom the German population and guarantees for the development of port as an international outlet. But they failed to frame a vention acceptable to Lithuania to give effect to this condit Active conflict being threatened, the Conference in Sept. asked League to deal with the matter. The Council appointed an partial commission, which made a thorough investigation of the l conditions, and in March 1924 presented a complete draft conv tion to the council. This convention (for the terms of which MEMEL) was accepted by both parties and endorsed by the Al governments.

The Corfu Dispute.—A much more important dispute, affectin principal power, was brought before the League in the autum 1923. An Italian General and his staff, who were engaged as rep sentatives of the Conference of Ambassadors in fixing the fron between Albania and Greece, were murdered on Greek soil, by sons unknown, on Aug. 27 1923. The Italian Govt. demanded repa tion and apologies of the Greek Govt., who accepted some of conditions and refused others. The Italian naval authorities the upon occupied the island of Corfu, loss of life occurring in operation (*see* CORFU). Greece appealed to the League, but stated her willingness to accept any decision of the Conference Ambassadors. The position of the Conference, as a body wh decision both parties agreed to accept and as itself directly interest made the formal competence of the Council doubtful. The Cou therefore confined itself to discussing detailed suggestions fo settlement and forwarding them to the Conference of Ambassad The Conference adopted most of these suggestions, but with an portant modification on the question of reparation. With regard this it dispatched an Allied committee of inquiry and, on receipt its report, which it withheld from publication, it awarded Italy full amount of reparation which she had demanded. Corfu was th evacuated. The immediate question thus settled, the Council ferred to a committee of jurists the question of legal principle wh the case had raised with regard to the competence of the Coun the right of coercive action and the responsibility of a state political crimes committed on its territory. Unanimous repl were received to these questions and were transmitted by the Cou to the Assembly; and the legal position was thus more clearly est lished as regards similar incidents in the future.

The case was an extremely intricate one, and there has been mu difference of opinion as to the action of the League. The Leag facilitated a quick settlement, the early evacuation of Corfu and avoidance of hostilities; and the actual proposals which it made to the details of settlement are not open to adverse criticism. Bu did not secure the adoption of all these proposals. The action of Conference of Ambassadors, in giving its award, while withholdi the report on which it purported to base it, would have been possible if the League had been in full control of the case. The f tors which made effective League action difficult were partly special and dual position of the Conference of Ambassadors in question and partly, it must be recognised, the fact that one of parties involved was a Great Power and that the general relations the Powers were at the moment complicated by other questions policy. The degree and limits of the League's action accurately flect the extent to which it was possible to make a collective wo opinion effective under the conditions created at the moment by relations between the governments, and especially the Great Pow on the council. That this collective opinion had an important fluence on the settlement is indisputable, and the expression of opinion, made possible by the meeting of the Assembly, was ind a revelation to all who witnessed it of what is bound to be hencefo a new force of the first importance in the political life of the worl

Mosul.—The Conference of Lausanne in 1923 found that its m difficult question in the settlement of the terms of peace w Turkey was the frontier line between Turkey and the Brit "mandate" territory of 'Iraq. Agreement having failed, the trea provided that Turkey and Great Britain should attempt to rea agreement by friendly negotiations, and that, if these did n succeed within nine months, the question should be referred to Council of the League. The negotiations failed, and in Aug. 1 the question was accordingly brought before the Council, who pointed a commission of three (a Swede, a Hungarian and a Belgia to investigate on the spot. The commission worked for eight mon and then presented a report in which, after reviewing exhaustiv all the factors of the case, they recommended unanimously that best solution would be for the disputed district, including the to of Mosul, to be included in 'Iraq if the British mandate could continued for 25 years, but that, if this were impossible, it would better to assign it to Turkey. When the Council had this rep before them in Sept. 1925, they were faced with the contention Turkey that the Council's task under the Treaty of Lausanne one of mediation, not arbitration, and that no decision could binding unless Turkey herself had assented to it. The Council ask

visory opinion of the Permanent Court of International Justice,
replied that the Treaty had given arbitral powers and that
onsent of the two parties was not required, though unanimity of
ther members was necessary. With this opinion, the Council
ec. decided, by a unanimous vote of all members other than
disputants, that the territory should be assigned to 'Iraq,
ct to the prolongation of the British mandate and the assurance
l protection for the Kurdish population. The Turks refused to
t the court's opinion that an arbitral decision was binding, and
drew from the Council at which the above decision was taken.
British Govt. undertook to ask for authority to accept the
ngation of the mandate for 25 years or until such earlier
as 'Iraq could be accepted as a member of the League, and
unced their intention to attempt the renewal of negotiations
Turkey.

uring this difficult period the Council took various measures to
in the maintenance of the *status quo* without hostilities and to
tigate complaints as to Turkish deportations of Christians and
tions of the frontier. The mission of Gen. Laidoner on behalf of
League for this latter purpose is of special interest as being the
of its kind. (For the general settlement *see* MOSUL.)

e Greco-Bulgar Incident.—On Oct. 19 1925 shots were ex-
ged between two Greek and Bulgarian sentries occupying fron-
posts separated by 40 yards on the frontiers northeast of
ika. On Oct. 22 Greek troops, under orders from Athens,
ed Bulgarian territory through the Struma valley and penetrated
t 8 km. on a front of about 32 kilometres. Bulgaria telegraphed
peal to Geneva asking the secretary general to convene a special
ing of the Council under the powers conferred on him by Article
the Covenant. This appeal arrived on Friday morning, Oct.
The secretary general at once decided to convene the Council,
after telephonic conversation with M. Briand, the president for
ime being, fixed it at the most quickly accessible place, Paris,
at the earliest date physically possible for members requiring to
from Stockholm, London and Rome, Monday, Oct. 26.
e same time it was arranged that a telegram should be sent to
governments in M. Briand's name, as president, calling on
sides to abstain from all hostilities. This telegram was also
tched the same Friday morning. Preparations had been made
Greek attack on the Bulgarian town of Petrich with a force of
men and three batteries at 6 A.M. on Saturday, Oct. 24;
the Bulgarian Commander had orders to resist. Briand's
ram, arriving in the two capitals on Friday, was immediately
ive. Orders arrived from Athens just in time to stop the Greek
k on Petrich.

Monday, the 26th, the Council met in Paris. The situation of
ediate danger, viz., the presence of Greek troops in Bulgarian
ory, was at once dealt with. Evacuation was demanded within
e-limit of 60 hours, and an assurance that the necessary orders
been given was asked within a time-limit of 24 hours. The same
orders were telegraphed to British, French and Italian military
chés to proceed from Belgrade and Athens to supervise the
uation. The attachés received their instructions on Tuesday,
eeded immediately by special trains, and arrived on the scene
tion about 2 P.M. on Wednesday, Oct. 28. There followed one
e most dramatic and significant scenes in history. The attachés
ce summoned the two commanders and gave them detailed in-
tions in the name of the League of Nations as to the evacuation,
ribing the times at which the evacuating troops should move
he interval which was to elapse before Bulgarian troops might
the abandoned territory. Within about 11 hours of the
rs' arrival, and eight hours before the expiration of the time
the last Greek soldier left Bulgarian soil.

e Council proceeded to deal with the question of reparation and
feguards against the recurrence of similar incidents. They
inted a commission, under the chairmanship of Sir Horace
bold, and including French and Italian generals and Dutch
Swedish civilian members. The commission reported to the
cil at Geneva at its meeting in the first week in December. Its
ngs (*see* BULGARIA) were approved by the Council and accepted
e two governments. The incident was closed and future security
e Balkans substantially increased.

e League in this case acted with promptitude and efficacy. The
expressed and developed at the recent Locarno conference, the
ve weakness of the countries directly concerned and the fact
this was the kind of problem with which the League was de-
d to deal, and was not complicated by the difficulties of incom-
y defined treaty provisions, all doubtless contributed to this

ese eight cases have been chosen as best illustrating the
acter of the political problems with which the League was
during the years 1920-5, and its method of working. Other
tes were brought before the League: between Hungary and
ania about the expropriation of certain Hungarian nationals
ransylvania; between Hungary and Austria about the Bur-
nd; between Hungary and Czechoslovakia about a frontier
itation; between Finland and Russia about Eastern
Karelia; a frontier dispute (Jaworzina) between Poland and Czechoslovakia, and a dispute between France and Great Britain with regard to the nationality of persons born of British parents but resident at Tunis.

Two Comments.—In reviewing the League's action in these political disputes as a whole, two comments at once suggest themselves:—

1. The extent of the League's power to act effectively necessarily varies with the general international relations of the governments in and outside the League. After Locarno the Council deals promptly and decisively with the Greco-Bulgar trouble. With the Vilna incident, which occurred when the relations between the principal powers were difficult and complicated by many divergencies of policy in other questions, the action is slow, indecisive and unsuccessful.

2. The League, whose normal task is to preserve peace on the basis of treaties fully concluded, is placed in a difficult position when it is asked to complete the work of settling terms of peace. In the Upper Silesia, Memel, Vilna and 'Iraq cases this was a complicating factor. In such cases the treaties are either incomplete or ambiguous; they may be complicated by *obiter dicta* in the course of the negotiations; the League is held responsible by public opinion not only for a decision within the limits of its mandate but for the character of the mandate which it has had no power to vary; and by the very fact that it is continuing the work of making terms imposed by a victor its impartiality is compromised.

DISARMAMENT AND SECURITY

The reduction of armaments is the first of the specific tasks imposed by the Covenant. There is none on which the League has achieved so little direct and tangible result, for armaments remain, in the world as a whole, at a level not very substantially lower than in 1913, and no reduction is directly traceable to League action. But the indirect results have been of great importance. For it at once appeared that reduction of armaments required an increased sense of security; and the search for methods of obtaining this led to the growth of a belief in all-inclusive arbitration, the most notable and fruitful political development since the Covenant.

The first action of the League was to appoint a "temporary mixed commission" to prepare the way for armament reduction. This commission, consisting partly of politicians (though not representing their governments), partly of military and other technical experts, and partly of persons representing special classes of public interest (*e.g.*, working-class opinion), finally elaborated a draft treaty of mutual assistance. The basic principle was a combination of a general and special guarantees. Within the cadre of a general treaty, groups of states would enter into detailed arrangements to support each other if attacked, and as a condition of being entitled to this support they would agree to proportional disarmament. The proposal was criticised on the ground that the detailed plans for reciprocal military support contemplated would be unlikely in fact to lead to reduced armaments and, above all, that the authorised grouping of friendly states against prospective enemies was in conflict with the essential spirit of the League. At the 1924 Assembly, when it was clear that these objections would be fatal to the draft Treaty, the whole problem was reviewed on another basis. In a month the "Geneva Protocol" was elaborated and unanimously agreed for recommendation to the governments (*see* SECURITY).

This second scheme also failed to win acceptance, the new Conservative Govt. of Great Britain taking the lead in its rejection as the previous Labour Govt. had led the opposition to the earlier treaty. Great Britain was not prepared to accept the unlimited obligation of arbitration in her own disputes, or the responsibility of assisting the enforcement of such arbitration over an unrestricted range of other countries who might accept the obligation.

Apart from the objection of substance made to certain of the principles of these two schemes, it may be suggested that their rejection was in part due to the methods and procedure by which they were framed, which differed from the ordinary practice and traditions of the League. The temporary mixed commission included in one body diverse elements (statesmen, experts, etc.) who, under the ordinary League system, are separated into clearly differentiated committees, each with its own competence and defined rôle. In fact, serious misunderstandings sometimes arose as to the extent to which a statesman connected with a government, but not on this matter representing it, might be taken to be reflecting its policy or a policy it might be induced to accept. Moreover, the commission for a technical body, which it was in principle, perhaps worked too long without the effective direction of a political authority like the Council. The Geneva Protocol, on the other hand, was dealt with too rapidly by the political body, the Assembly, the work of experts having to proceed simultaneously with the political discussions and not having preceded them, as is the normal League method. The consequence was that the Assembly was acting more as an advisory body recommending a scheme than a political authority of fully accredited representatives. For so important a project the work of political preparation had been inadequate.

When all is said, however, it is difficult to regret even the haste of the 1924 Assembly, for the demonstration which it gave of the genuine desire of a large part of Europe for all-inclusive arbitration, and the impetus it gave to the movement towards arbitration throughout the world, have been perhaps the most important factors in political history since 1919.

Certainly the preparation of these two schemes was essential to the Locarno agreements of 1925. By "preparation" of course is not meant merely the technical elaboration of the proposals. In international agreements, that is always the least part of the work. It is the preparation of the public opinion of the world, of the minds of ministers and their advisers, which is the important thing. The preparation, in this wider sense, at Geneva was the indispensable basis of the Locarno treaties. These treaties provide for all-inclusive arbitration, on very much the Protocol principle, but over a restricted though wide range of countries; and for mutual guarantees and support somewhat similar to those of the original treaty of mutual assistance. It is, however, of their essence that the main vital guarantee is "bilateral" and not based upon a grouping of Powers presumed to be friendly against others presumed to be unfriendly.

Traffic in Arms.—Apart from these efforts to deal with the fundamental problem involved in the reduction of armaments the League has worked at the two subsidiary and connected questions of the traffic in arms and their private manufacture.

A Draft Convention to regulate traffic in arms was drawn up at a conference of 44 states, including the United States, Germany and Turkey, in Geneva in June 1925. The object of this Convention is to establish a general system of supervision and publicity over the international trade in arms and munitions, and a special system for certain land areas and maritime zones. Governments alone are to have the right to export or import arms exclusively designed for war, and a licensing system is provided for. In general, it may be said that the Convention does not give any effective authority to control traffic by international action, but is likely to provide the publicity which is the first condition of either national or international restriction when that proves practicable. This international aspect of private manufacture of arms, is still (1926) under preliminary study.

THE SAAR, DANZIG, MANDATES, MINORITIES

In certain areas of the world the League, normally an instrument through which sovereign states settle their differences or co-operate in matters of international concern, has itself direct and special responsibilities for government and administration. In the Saar it has the full responsibility of a sovereign state, exercised through a permanent commission appointed by and responsible to the Council. The small free city of Danzig is under its special protection, and a resident High Commissioner of the League acts as arbitrator on disputes between the free city and Poland. Over the large area of the mandated territories separated from the German and Turkish Empires by the terms of peace, it is responsible for seeing that the mandatory powers govern and administer in accordance with the mandate and the provisions of the Covenant. And in a number of states it has duties with regard to the protection of minority populations.

The Saar Basin.—The Saar Basin (*q.v.*) is a mining district
a predominant German population of some 700,000, whic
Treaty of Versailles transferred from Germany to the trustees
the League for 15 years, after which its future fate is to be d
by a plebiscite. The treaty prescribes the form of govern
through a governing commission, subject to the Council of the L
only, the inhabitants having no rights of representative gover
outside purely local administration, though the Commission a
quired to consider the views of elected representatives before c
ing the laws or imposing new taxes. The treaty also transferr
property in the mines to France in compensation for the destr
of the mines in Northern France.

The Saar Govt. is thus, by treaty provision, not by Leag
cision, purely autocratic and unrepresentative. With an over
ing plebiscite and situated between France and Germany,
inevitable that its inhabitants should have developed an extr
sensitive political consciousness and that the district should
been a mirror reflecting the controversies of its two great
bours. There has in fact been considerable political frictio
tension, varying directly with the changing political relati
France and Germany.

The Council and the Commission have been criticised for some
appointments on the Commission, for the introduction of the F
franc as the sole legal tender, for questions affecting educati
certain administrative decrees designed to prevent disturbance
ing a strike in 1923, for the presence of French troops for the
tenance of order which the treaty contemplated would be under
by local gendarmerie, and in general for an undue regard for F
interests. The inquiry made by the League in July 1923 showe
some of the charges were not without foundation. The Comm
has now developed an elected advisory council, designed to g
full representation to the wishes of the inhabitants as is p
under the autocratic régime imposed by the treaty; the admi
tive measures complained of in 1923 were changed with the te
tion of the strike; French troops were gradually replaced by
gendarmerie, and the political tension generally relaxed wi
improved relations of France and Germany.

The main grievances, substantial though they had often
have in reality been complaints against the provisions of the t
against conditions which those provisions made practically inev

League is at once compelled by those terms to action which
the mark of its origin, and at the same time is criticised by the
ards properly applicable to an international authority which
only impartial but unfettered.

Danzig.—The free city of Danzig, a small wedge between
Prussia and the Polish Corridor, is important as the chief ou
the sea for Polish trade. To act as a kind of court of first insta
the disputes bound to arise out of the intricate and nicely ba
provisions of the Danzig constitution (*see* DANZIG) it was pr
by the Treaty of Versailles that the League should appoint a r
high commissioner, a further appeal lying to the Council. The
been great tension and mutual suspicion throughout practical
whole six years between Danzig and Poland, such as some
almost to make negotiations between the two impossible.
these conditions the Council has had to devote much ti
nearly every meeting to disputes of which the one about Po
right to have post-boxes under her own control within Da
typical and the best known. The economic life of the city has
whole been satisfactory, the vessels entering the port and the e
rising considerably above the pre-War level. The demoralisa
the German mark caused great difficulties, however, and
was urgently needed to adjust her port and other facilities
new conditions. The League gave an expression of its spec
terest in the city by assisting her to introduce successfully a
currency of her own and later to raise a municipal loan for de
ment purposes.

Mandates.—The German colonies and the Arab provinces
Turkish Empire, ceded as a result of the World War, were not
ferred to other states in full sovereignty. Their administratio
entrusted to different mandatory powers under the general
vision of the League. For the terms on which the mandates
given and the general supervision exercised by the League th
the permanent mandates commission, *see* MANDATES.

It is difficult to measure the extent to which this system of
vision does in fact modify colonial administration. No indi
can of course be found by searching the League records for ins
of censure and repentance. That is not the way in which t
fluence of a collective opinion operates, or can operate, witho
ruptive results on the conduct of Great Powers. That does not
however, that this influence is not profoundly effective. Man
powers and their administrators are keenly sensitive to the
and informed criticism which is always forthcoming in the Co
sion's meetings, even if it finds little reflection in the public
tions; and the desire to avoid risk of exposure to it is a fac
daily colonial administration comparable with the influence exe
by Parliament on Whitehall by the right to ask questions
responsible minister.

Minorities.—The work of the League in the protection of
ities (*q.v.*) is one of the most important, and perhaps the most d

all its current duties. Nine states are under treaty obligation, l five others have by declarations accepted a similar engagement, observe in their administration certain principles designed to ure to racial and religious minorities within their territories pro- ion of life and liberty, the free exercise of religious rights and the use of their native tongue, with opportunities of education in it ere it is the native tongue of a considerable proportion of the ulation. The minorities number in all some 30,000,000, and are ituated that no possible treaty provisions or frontiers could have en them rights of sovereign self-government without creating umerable states or enclaves. They are free citizens of the states which they belong, and the only ultimately satisfactory solution hat they should become indistinguishably incorporated in the eral political life of the country. In the meantime the racial, gious and traditional feelings of enmity between them and those form the majority of the population subject them to the dangers lifferential majority government and administration.

he difficulties so caused constitute perhaps the greater part of political troubles and political dangers of Europe. It is a problem eculiar delicacy, for the minorities constitute a kind of state with- the state, and interference with or even open criticism of the ernment on which the daily conditions of their life depend may ays do more harm than good. For this reason complaints are v considered officially by the Council if they are put on the nda by a member of the Council, who satisfies himself that they sufficiently serious and well founded to justify this action; and council itself deals directly with these questions, not entrusting m beforehand to any technical committee. The League's in- nce is exercised for the most part in the form of private repre- tations and conversations which gain their authority from the that the sanction of a public discussion at the Council always ains as a possibility in the background.

Economic and Financial Reconstruction

The reconstruction work of the League shows, better than thing else, that the League is not confined to a limited range pecial tasks, but is an instrument which the governments of world can use for any form of international co-operation y wish to undertake. The Covenant imposes scarcely any cific economic or financial duties. It implies the preparation conomic sanctions; it contains the obligation to secure and intain freedom of communications and transit and (in a vague l ambiguous phrase) equitable treatment for the commerce all member states; but there is nothing which directly con- nplates such tasks as that of the financial restoration of a ntry.

he League's work in this sphere began with the Brussels ncial conference held under its auspices in Sept. 1920. Ex- ts from 39 countries, named by the governments but not resenting their policy, met to consider the methods by which ble finances and currencies could be restored. They drew up eries of unanimous resolutions which, elaborated as they were the later Genoa Conference of 1922, have since served as a ful guide and support to countries attempting to restore their nces. More important, however, than the establishment of general body of doctrine was the League's practical work in elf restoring the finances of two countries, Austria and Hun- y, whose problem was beyond their own unaided resources.

ustria.—It is interesting to observe the mechanism of the League lealing with the extraordinarily complex political and financial blem of the republic of Austria (*q.v.*). A sub-committee of the ncil handled the political aspects of the question. The financial nmittee worked out a technical scheme of reconstruction; the nomic committee considered what immediate economic measures ld be useful; a legal committee worked side by side and prepared formal instruments to embody the technical recommendations; behind all the Assembly provided the motive force of the col- ive good will of the world towards an effort to save a member e from destruction. The composition of the financial committee, which the heaviest burden fell, deserves special attention. It sisted of experts, partly drawn from national treasury depart- nts and partly from private finance. They sat as experts and not epresentatives of governments, and were thus able to recom- nd proposals involving government action, without waiting for assent of the governments. At the same time, their position bled them to estimate with special knowledge how far it was sible to induce the several governments to go.

he principles of the scheme proved of such importance in the ure history of European recovery, and were so novel and untried he time, that it is well to summarise them briefly. The immediate ble with Austria was that her currency was rapidly falling to . This was due primarily to the fact that the revenue was in- icient for the public expenditure, and the government, having no other resources, was meeting the deficit by printing notes. The scheme therefore provided that the inflationary issue of notes should cease and, to assure this, that the right of note issue should be transferred from the government to an independent Bank of Issue, working on commercial principles. This of course did not solve the problem. Inflation resulted from the unbalanced budget. Austria was, therefore, required to undertake internal reforms which would bring the budget into equilibrium. As this would take some years, and it was essential to stop inflation at once, it was proposed to raise an external loan of some £27,000,000 which would be available to meet deficits during this period. As security for this loan Austria's assets, primarily her customs and tobacco receipts, were assigned and placed under control. At the time, however, there was an obvious danger that Austria herself would fall to pieces, in which case her customs and tobacco receipts might also disappear. They were, therefore, an insufficient basis on which to issue a loan. This difficulty was met by securing government guarantees of the loan, in different proportions, from Great Britain, France, Italy, Czechoslovakia, Sweden, Holland, Belgium and Denmark, two other countries, Spain and Switzerland, associating themselves with the loan in a somewhat different form. In addition, a political protocol was signed assuring Austria's political and economic independence. Lastly, there was to be a Commissioner-General responsible to the council in general control of the whole scheme, controlling the assigned revenues, holding the proceeds of the loan, and supervising the reform of the Austrian budget.

The scheme was therefore essentially one of *financial* reconstruction. It did not directly undertake the economic restoration of the country. Its contribution to economic development was to afford the indispensable basis of a sound currency.

This work is now practically completed. The currency was at once stabilised in 1922 and has remained absolutely stable ever since, the only currency in Europe remaining stable throughout the period. Taxation receipts covered ordinary expenditure during 1924–5 and a large part of the reconstruction loan has been available for increasing the capital resources of the country by productive investment. The control of the budget ceased on Dec. 31 1925, and it is anticipated that the office of the Commissioner-General will be terminated before the end of June 1926.

Hungary.—The results in Austria led, a year later, to a request for similar aid from Hungary, whose currency and finances reached the same position as Austria's, though more slowly. Here the problem was technically easier, as Hungary had a solid agricultural basis for her economic life and was more than self-sufficient in the primary necessities of food. But it was politically more difficult, for her neighbours, particularly Czechoslovakia, Serbia and Rumania, speculated anxiously as to the attitude of a restored and strengthened Hungary, and their relations with her were embittered by many unsettled disputes. The League could not act except at the unanimous wish of all the interested countries, who included Hungary's neighbours, and it looked as if this would prove an insuperable obstacle. Under the influence of the League, however, these disputes were settled—with an incidental advantage to the political situation of Central Europe extending far beyond the immediate results of the reconstruction scheme.

The scheme was identical in its main principles with the Austrian, but the loan was less than half the amount, it was issued without government guarantees and provision was made for a moderate reparation payment under technical conditions which afforded a valuable precedent for the German problem. The Hungarian crown was at once stabilised in relation to sterling and with sterling has now gone on to gold. The budget recovered its balance after the first few months. Control began on May 1 1925. The first subsequent financial year (July 1 1924 to June 30 1925) showed a surplus of 63,000,000 gold crowns and there was a further surplus in the first six months of the following financial year. The great bulk of the loan, therefore, not being required for its primary purpose of meeting budget deficits, will be devoted to productive investment. It is anticipated that the control will end with a declaration by the Council that the financial stability of Hungary is assured at about the same time as the Austrian, *i.e.*, in June 1926.

German Reparation.—Though the League had no direct responsibility for handling the German reparation problem, the experience gained in the Austrian and Hungarian schemes certainly contributed to its solution. The most important principles of the Dawes scheme had been anticipated, and for the most part tried in practice, in these earlier schemes. It is sufficient to mention the stabilisation of the currency, the foundation of an independent bank of issue, the provisions for the maintenance of budget equilibrium (with the important difference that no general budget control was necessary in Germany), the fixation of reparation payments not for all time but for a considerable period, the principles of the control of the assigned revenues and the " transfer " system.

Greek Refugee Settlement.—Reconstruction work of a somewhat different kind has been undertaken by the League in the settlement of Greek refugees (*see* Refugees) who to the number of nearly 1,500,000 or more than a fifth of the population of Greece, fled back to Greece as a result of the Greco-Turkish War, a task evidently beyond the unaided resources of Greece. With the aid of the League a loan of £10,000,000 was raised and employed to settle the refugees in productive employment, mainly upon the land. The work, directed by a refugee settlement commission, consisted of an American chairman and a British vice-chairman, selected by the League, and two Greek members, chosen with the Council's approval by the Greek Government. The bulk of the refugees were housed, allotted land, and started on their new careers with a small initial capital and the necessary equipment.

Among other work carried on under the direction of the financial committee have been the introduction of a new and stable currency, later followed by a municipal loan, for Danzig; financial advice to Estonia and Albania; and a study, which is still continuing, of the problem of double taxation.

Trade and Commerce.—Meantime the economic committee has been working patiently at the task of securing more "equitable treatment" for commerce in the spirit of Article 23 of the Covenant, and in removing impediments to international trade. The most important achievement in this sphere was the conclusion in Oct. 1923, of a convention for the simplification of customs formalities. In addition, a convention has been arranged which has removed some of the obstacles to commercial arbitration. The committee have also considered the equitable treatment of foreigners (the recommendation of a code of principles to guide governments in their treatment of foreign enterprises established in their territories) and the suppression of fraudulent trade marks. They have embarked upon an attempt to secure the abolition of prohibitions of exports and imports.

A communications and transit committee, with numerous subcommittees, includes experts in land, sea and air transport, and is responsible to a periodical conference. The first important conference was held at Barcelona in 1921, when two conventions were approved laying down the general principles that transport originating in one state and crossing a second into a third, or transport making use of through international waterways (*see* INLAND WATER TRANSPORT), should enjoy complete liberty of transit with equal treatment for all flags and freedom from customs duties and vexatious dues. A second conference held at Geneva in Nov. 1923 dealt with international railway traffic, equality for shipping in maritime ports, the transmission of electric power across a third state and the development of hydraulic basins situated between two or more states. The maritime ports convention, drawn up at this conference, provides for equal treatment of all states in port dues and regulations, while the railway convention codifies existing railway practice as regards international traffic and aims at simplifying frontier formalities for passenger and goods traffic. All the conventions concluded at these conferences provide for machinery of compulsory arbitration similar to those contained in the clauses of the Peace Treaties of 1919 relating to communications and transport. In such cases the transit committee of the League acts as a mediatory body before a case goes for compulsory settlement to the international court of justice. The transit organisation has been instrumental in effecting considerable improvements in the passport system (particularly in the abolition of visas in many cases) and it has arranged a further passport conference to continue this work in 1926.

Among other questions studied are the reform of the calendar, commercial aerial law, wireless regulations, international motor drivers' licences, etc.

MISCELLANEOUS QUESTIONS

The League is also an instrument of positive co-operation in work of general benefit to the world. The short space here allotted to this must not be taken as an adequate measure of its relative importance in the general achievements of the League. For its health work the League has the assistance of a technical health committee, composed, like the financial, economic and transit committees, of experts. This health organisation has had the active co-operation of the United States, Germany and Russia, as well as the member states, and its activities have extended throughout Europe and the Eastern Mediterranean, tropical Africa and the Far East.

Public Health.—Its first important work was to assist Poland by means of an Epidemic Commission with the best western experience to prevent the spread of typhus through Poland to Europe. For this purpose it was necessary to attack the problem in Russia itself, and the Commission went to Russia, established effective co-operation and opened offices in Moscow and Kharkov. This was followed by a European conference at Warsaw in May 1922, attended by Soviet Russia, the Ukraine, Turkey, Germany and 24 other states. A draft convention was drawn up and has since become the basis of bi-lateral agreements between the nations adjoining Poland and Russia. Public health courses were arranged for health officers at Moscow, Kharkov and Warsaw. The Epidemic Commission next gave assistance to the Greek health authorities in dealing with the dangers of epidemic resulting from the sudden immigration of
masses of Greek refugees in and after the Greco-Turkish w

Apart from such emergency assistance, much has been don
secure an interchange of knowledge and experience between
public health organisations of the world, to promote their
operation and to study the characteristics of special epidemi
endemic diseases and the methods of combating them. Vari
missions have visited the Eastern Mediterranean, the Far E
Greece and Albania, the Balkan States, Russia and Italy, Pal
tine and Syria and Persia. Scientific work is also being d
with a view to the standardisation of sera and of certain dr
for the treatment of diphtheria, tetanus and dysentery.

An interesting experiment, which has been made possible
a large scale by the generosity of the Rockefeller Foundation
the interchange of selected officers of health administratio
Officers of one country visit those of another, study their metho
participate for some weeks or months in practical work a
then meet at Geneva to compare results. Lastly, the hea
organisation maintains an epidemiological intelligence servi
publishing at regular intervals detailed information of the mo
ment of epidemic disease throughout the world.

Drug Traffic.—Of what may be called the social questi
handled by the League the control of noxious drugs, and p
ticularly opium, has been the most difficult and important. T
League took as its starting point the Opium Convention of 19
which had been signed by most countries in the world.
advisory committee was appointed to prepare a plan to ma
the application of this convention more effective in practi
They took as their aim the restriction of the traffic to medici
and scientific requirements, and started an investigation to
cover the extent of these requirements. Finally, the U
Govt. sent a delegation to participate in the work of this co
mittee, and in any conference which might follow, and
attend the 1924 Assembly which reviewed the progress of
previous year and a half. Two plenipotentiary conferences
lowed in the winter of 1924–5. The first of these dealt with
question of the gradual suppression of opium smoking in the
East with a view for its ultimate abolition.

At this an agreement was reached under which the signat
states undertook (*a*) to strengthen the measures already p
vided for in the convention of 1912 and (*b*) to suppress entir
the consumption of prepared opium in their respective te
tories within 15 years from the date at which the poppy-grow
countries should succeed in preventing the clandestine expor
tion of raw opium from constituting a serious obstacle to
restriction of consumption in the former territories. The sec
conference drew up a convention for the more effective rest
tion of the production or manufacture of narcotics and of
international trade in them. The latter is to be controlled
particular by a system of export authorisations and imp
certificates. A permanent central board is to be establis
which is to receive periodical estimates from the contract
parties of the quantities of narcotics they need and ask for
planations if they are such as to suggest a danger of illicit tra
A further protocol engages the signatory states to take measu
which shall completely prevent, within five years, the smuggl
of opium out of their territories from constituting a seri
obstacle to the suppression of the use of prepared opium
other countries.

The American delegation had brought a complete program
of their own, which they failed to get adopted. The chief
ference was that they wanted a more definite undertaking th
the other countries thought practicable for the restriction of
growth of the raw product and for the cessation within a term
years of the prepared opium. They ultimately withdrew fr
the conference, as did China.

White Slave Traffic.—Certain work has also been done by t
League in connection with the traffic in women and the prot
tion of children. A convention was drawn up by the 1921 Asse
bly strengthening in certain respects the provisions of two p
War conventions dealing with traffic and has been signed by
states. The problem is also being studied by one of the t
committees of the Commission for the protection and welfare

dren and young people, which includes representatives of untary organisations and makes annual recommendations to Assembly. The study of child welfare is undertaken by the ld Welfare Committee of this Commission.

part from this general work the League took direct practical sures in 1921 to rescue, and where possible restore to their people, women captured and removed from their homes ing the military operations in the Near East, houses of refuge ng established at Constantinople and Aleppo. Lastly, in 3, the League arranged a conference at which a convention drawn up to assist in the suppression of the international ffic in obscene publications.

umanitarian Work.—Two important pieces of humanitarian rk have been undertaken by the League through Dr. Nansen. 1926 large numbers of war prisoners were still in Russia and acent countries awaiting the means of repatriation. With aid of certain charitable societies Dr. Nansen organised a t of steamers under League charter in the Baltic and Black s and 427,386 prisoners of 26 different nationalities were reriated at the astonishingly low cost of less than £1 a head. Nansen also undertook somewhat similar work for the settlent of large numbers of Russian refugees. Their movements re assisted by the invention of a special system of identity tificates, as a substitute for passports, and considerable progs has been made in finding them employment.

Two other pieces of humanitarian work may be mentioned in clusion, a convention drawn up at the 1925 Assembly for the pression of slavery (*q.v.*) and restriction of forced labour, and scheme prepared by Senator Ciraolo and now being worked t in collaboration with Red Cross organisations, for the proion of insurance against national calamities such as earthakes. Among other tasks, the most novel departure has haps been the work of the committee on Intellectual Coeration (*q.v.*) which has till recently been presided over M. Bergson and has included among its members Prof. nstein, Madame Curie and Prof. Gilbert Murray.

Under Article 24 of the Covenant some international bureaux ablished by convention must be, and others may be, brought der the League. Four such organisations have now been iliated, viz.: relief bureau (for the repatriation of distressed rsons), a hydrographic bureau (to secure co-ordination in drographic work), an office for the control of liquor traffic in rica and a committee for air navigation. The League issues a ndbook giving information about some 360 international ganisations and a quarterly bulletin giving some account of eir work.

SUMMARY OF WORK

In these six years (1919–25), therefore, the League has averted stilities in some half-dozen cases and probably prevented at st minor wars in several of them. It has made a substantial ntribution to Europe's recovery by the guidance and influence the Brussels Financial Conference; by the direct reconstrucn of Austria and Hungary; by the model so afforded for the lution of the German problem and the self-restoration achieved other countries; and by a series of transit and customs forlities Conventions and other measures designed to remove the pediments to international trade. It has repatriated some ndreds of thousands of refugees and established nearly 00,000 in productive employment in Greece. It has exercised varying but increasing influence over the government of some ,000,000 of minority populations entrusted to its guidance. has supervised the mandatory administration of the former lonial Empire of Germany and Turkey. It has directly govned the district of the Saar and has assisted in the government Danzig. It has worked at a number of social problems, the gulation of opium and other drugs, and the protection of men and children.

Apart from these tangible and visible results, it has peneated and modified the policies of national governments through e regular contact, and co-operation in international work, of reign Ministers, quarterly and annually at meetings of the Council and Assembly, and of their advisers and technical assistants both at these meetings and at a series of technical conferences and discussions. Beginning with disarmament but extending to security, it has prepared the way for the great extension of comprehensive arbitration embodied in the Locarno agreements and doubtless destined to extend beyond them.

On the other hand, the League remained long impotent before the protracted conflicts which reflected the incompleteness of the conclusion of peace in 1919 both in diplomacy, as in the reparation question, and in actual hostilities, as between Greece and Turkey. In some of the disputes which it has handled, it has been indecisive or ineffective; in others, the nature of its action has apparently been determined as much by the relative strength of the disputants as by considerations of ideal justice. It has made no material progress in securing disarmament. Its work in removing the fundamental causes of war, and in particular those which spring from economic policy, has only begun.

Whether these results will be regarded as disappointing or as satisfactory will doubtless depend mainly on the standard by which they are judged. By comparison with the pre-War position and methods of negotiation there can be no doubt that they represent a very great achievement. No better illustration can perhaps be found than in two references to Lord Grey's book, *Twenty-five Years* (1926). Of the London Conference of Ambassadors of 1913, for example, he says in effect that it lasted eight months, discussed minor questions and settled nothing, but was well worth while because it gave the world a sense of confidence to think that there was some method of international contact during a period of tension.

In contrast with this, even the Assembly of 1925, the least spectacular of recent years, in three weeks dealt with a mass of useful work, of real if secondary importance, and the assurance of a regular method of international contact is now not temporary but permanent. Still more significant is the account which Viscount Grey gives of the conference of the Balkan Powers when they met, as it happened in London, after the first Balkan conflict of 1912. He believed that the policy they were discussing would mean both the resumption of war and a disastrous result, as indeed it did. But neither Great Britain nor any other Great Power was directly concerned. If his opinion were asked in unofficial conversations he gave it, informally, tentatively—and in fact without effect. Neither he nor anyone else felt able to intervene in a matter directly affecting only the negotiating States. The second disastrous war followed. In contrast with this the settlement of the recent Greco-Bulgar dispute of 1925 illustrates the recognition of the new principle that a war is the concern of the whole world.

If, however, our standard of judgment for the results of the six years is not the pre-War position but the ultimate ideals of the League, it is no less clear that the League's work is only in its infancy. The League is not yet universal in its composition. Its ability to deal with a first-class dispute between first-class Powers has fortunately not yet been tested. There is as yet no complete assurance that such a dispute would find the League united and effective. Nor has more than a beginning been made in removing the causes from which such disputes may arise. This, the ultimate object of the League, must in the nature of the case be a progressive, and indeed a permanent task. It means a complete, if gradual, revolution in the traditional and historic attitude of the nations of the world to each other and a transformation of many of their policies. In this work the League may lead, but it can never advance far beyond, the public opinion of the world. The scope is illimitable and the task unending.

BIBLIOGRAPHY.—The main authorities are the League's own publications, which give complete information as to all its activities. In the first place the *Official Journal* contains the minutes of the Council with the documents presented to it; while the records of Assembly meetings are issued in special supplements. All Treaties registered under Article 18 of the Covenant are published in the *Treaty Series*. All reports of specially appointed League Commissions are at once published, as are also the periodical reports of permanent officers and authorities carrying on League work (such

as the Commissioners General in Austria and Hungary, the Greek Refugee Settlement Commission, the Saar Governing Commission, etc.). As these official records are very voluminous the League also publishes (*a*) an abbreviated *Monthly Summary*, giving a regular account of League activities and (*b*) a series of special pamphlets as to special tasks (health work; reconstruction of Austria; mandates, etc.) and a general summary "A Survey." In addition, the League issues technical publications on various subjects of world interest. Of these the most important are the *Economic Publications* (including a *Monthly Bulletin of Statistics*, which gives a synopsis of all main statistics indicative of economic development throughout the world, and annual publications on *Currency, Public Finance, Trade and Commerce*), a *Military Year Book* and a *Monthly Epidemiological Report*. These publications are issued in English and French through League agents (in England Messrs. Constable).

Books on the League work are numerous, especially with regard to special subjects (the Saar, Opium, etc.) and the general principles and conception of the League. Of those which summarise the general work of the League the following may be mentioned: Publications by the League of Nations Union (1920, etc.); Organisers of the League of Nations, *The League of Nations Starts* (1920); W. Schücking und H. Wehberg, *Die Satzung des Völkerbundes. Kommentiert* (1921); L.V.A. Bourgeois, *L'Oeuvre de la Société des Nations 1920–1923* (1923); P. Munch, *Les Origines et l'Oeuvre de la Société des Nations* (1923); R. Williams, *The League of Nations To-day* (1923); H. G. Alexander, *The Revival of Europe* (1924); M. Fanshawe, *Reconstruction*, a full summary to 1925, well documented (1925). League of Nations Information Section, *Pamphlets on the League of Nations*, its Covenant and its various activities; P. J. N. Baker, *The Geneva Protocol for the Pacific Settlement of International Disputes* (1925); Sir G. G. Butler, *A Handbook to the League of Nations, brought down to the end of the 5th Assembly*, with an explanation of the Protocol . . . with an introduction by the Right Hon. Viscount Cecil of Chelwood, 2nd ed. (1925). The publications of the World Peace Foundation include a number on the work of the League. Among these are *Handbook on the League of Nations, 1920–24*, and the *Yearbook of the League of Nations* (1925). (A. Sr.)

LEARNED SOCIETIES.—Incorporated by royal charter in 1902 "for the promotion of historical, philosophical and philological studies," the British Academy has since 1910 proved itself a potent force in the branches of learning which come within the scope of its activities.

The Proceedings of the British Academy, of which 10 vol. have been published, comprise "communications," together with special annual lectures endowed by private benefactors, or by public subscription. Other publications are *Supplemental Papers* (1911, etc.) and the annual *Schweich Lectures* on Biblical Archaeology, inaugurated in 1908.

The Fund—an anonymous endowment of £10,000—has also enabled the Academy to help forward the work of excavation in Bible lands. The series of *Social and Economic Records* under the direction of the late Sir Paul Vinogradoff, was started in 1908, with the support of a Government grant; five vol. have now been published. A renewed grant in aid of the Academy's work has furthered the continuation of this series. The publication, by the Clarendon Press, of the facsimiled *Old Testament of the Codex Sinaiticus* (1911–22) was made possible by an anonymous gift.

National Commemorations.—Since, in 1908, it organised the commemoration of the tercentenary of Milton's birth, the Academy has become the recognised co-ordinating body for the organisation of similar national commemorations, aided in this by the foundation of the annual Master Mind Lecture (one of a number of endowments, under the will of the late Henriette Hertz). The Academy's activities in furthering the Shakespeare tercentenary in 1916 were stimulated by the establishment, in 1911, of the annual Shakespeare Lecture (endowed by the late Mrs. Frida Mond). The annual Raleigh Lectures on History (founded by Sir Charles Wakefield, in 1919) the tercentenary of the death of Sir Walter Raleigh, were inaugurated by Lord Bryce, president of the Academy, with a survey of world history.

Among other endowments may be mentioned the Warton Lecture on English Poetry; the Philosophical Lecture; the Italian Lecture; the Lecture on Aspects of Art; the Lecture on English Philology and Literary History; the Cromer Prize for Greek Essay; the biennial Prize for English Studies. The Academy administers also the Rose Mary Crawshay prize fund for English literature, an annual prize of £100 awarded to a woman of any nationality for work on English literature.

Educational Work.—The Academy has provided a platfo
for dealing with educational needs. Thus, the School of Orien
Studies, now an integral part of the University of London, w
largely the outcome of a scheme submitted to the Academy
1904 by the late Professor Rhys Davids. The organisation of I
perial Studies, now recognised in London and in other Briti
universities, was directly due to proposals made by Sir Sidn
Low, in a paper read before the Academy in 1912. The Engli
Place-Name Society, founded in 1921, to carry out the survey
English place-names, was inaugurated under the auspices of t
British Academy in 1923, as the result of a statement submitt
by Professor A. Mawer, now Director of the Society. The me
bership of the Society, drawn from all parts of the country,
ready numbers some 700. The foundation of the British Scho
of Archaeology in Jerusalem in 1919 was brought about by t
Academy, in conjunction with the Palestine Exploration Fun
Students are now being trained at the school to fill posts creat
by the formation of a Government Department of Antiquiti
The compilation of a register of the archaeological sites of Pal
tine has been taken in hand. The Government Museum of Anti
uities has been organised. The exploration of various sites
Palestine and, not least, the excavation of two palaeolithic cav
in Galilee, and the discovery of the "Galilee" skull, are amo
the early achievements of the school, under the directorship
Professor J. Garstang. The establishment of the British Scho
at Jerusalem, in which the late Professor Leonard King was p
marily concerned as initiating the idea, must take an importa
place among the more recent efforts of the Academy. In all th
archaeological work the Palestine Exploration Fund has be
foremost and active, and among its recent excavations are tho
on the Hill of Ophel at Jerusalem, the results of which confir
the view as to the site of the City of David. Meanwhile remar
able discoveries have been made in the Near East (*see* ARC
AEOLOGY: *Western Asia*).

Among the enterprises promoted by the Academy is the *Enc*
clopaedia of Islam (1908, etc.)—perhaps the most important pro
ect of the International Associations of Academies (which laps
at the outbreak of the World War). The scheme was launched
the meeting of the Association held in London, 1904. The enc
clopaedia is issued in English, French and German. Sir Thom
Arnold, nominated by the Academy, acts as English edito
The Government of India, through the Academy, contribut
towards the publication of the English issue.

International Relations.—Internationally, the Academy
closely associated with the newly established Union Académiq
Internationale, in which body it represents Great Britain. Th
principal proposals of the *Union* in which the Academy is co
cerned are the following: (*a*) *Corpus vasorum* (1922, etc.); (
Catalogue of Alchemical MSS (1926, etc.); (*c*) *Dictionary of Media*
val Latin; (*d*) *Forma Imperii Romani;* and (*e*) supplements
the *Corpora Inscriptionum graecarum et latinarum.*

Other Learned Societies.—The leading departmental societie
the Society of Antiquaries, the Royal Historical Society, th
Royal Society of Literature, the Early English Text Society, th
Selden and other societies have all continued, developed an
renewed their activities, during the period under consideratio
Among newer developments may be mentioned the remarkab
progress of the less eclectic institutions, such as the Englis
classical, historical, geographical and modern languages assoc
ations, and the important part played by them in securing du
recognition for humanistic studies, in the scheme of nation
education. The value of classical study is increasingly reco
nised and there is due appreciation of the danger likely to accru
were it submerged by newer studies. The organisation of co
operative research in studies appertaining to modern languag
and literatures was advanced by the foundation, in 1916, of the
Modern Humanities Research Association. Many agencies hav
promoted the recognition of English and its paramount positio
among modern studies—notably the English Association, and, i
more specialised work, such societies as the Early Text Societ
the Malone and the S.P.E. (Society of Pure English), of which
Dr. Robert Bridges, is the founder and leading spirit.

The Shakespeare Association (incorporating the Shakespeare ly Committee), founded in close connection with the Shake- are Tercentenary, 1916, has started a survey of Shakespeare in e various countries of the world, and has published a number papers. The Bibliographical Society, founded in 1892, has nce 1910, mainly owing to the activities of Professor A. W. Pol- rd, issued a number of important publications on English liography. In 1920 the society took over *The Library*, founded the late Sir John MacAlister in 1888, and incorporated its *ansactions* with it, as a bibliographical quarterly. (I. G.)

SOCIETIES IN THE U.S.A.

A feature in the United States during the period 1910–26 has en a marked tendency towards decentralisation and specialism constantly narrower groups or subjects. The number of soci- ies has increased, with a corresponding increase in the number individuals engaged in research work, but the professed scope the large majority of these organisations is local, particularly the fields of history, ethnology and geology. All the older cieties continued to function, with little or no change in organ- ation or objective. The Smithsonian Institution maintained s pre-eminency, particularly in the fields of American ethnol- y and astrophysics. The American Oriental Society, founded 1842 for the promotion of Oriental studies and the encourage- ent of research in Eastern languages and literature, continued publish a journal which has appeared without a break since 43, and extended its activities by including in its field of search the historical study of religion in its widest scope. he National Geographic Society, with possibly a larger mem- ership (700,000) than any other society in the United States, as very active both in organising and financing explorations d in publication.

Of recent formations the Carnegie Institution of Washington, .C., is the most important. It was endowed in 1902 by the late ndrew Carnegie with a sum of $22,300,000 to encourage in the roadest and most liberal manner investigation, research and dis- overy and the application of knowledge to the improvement of ankind. Organised in departments, including those of experi- ental evolution, embryology, botanical research, marine biol- gy, meridian astrometry, eugenics and nutrition, it is working nergetically along its selected lines of investigation. In addition other work in terrestrial magnetism, researches are prosecuted atmospheric electricity, magnetism in general and other allied opics. The Institution has physical laboratories at National ock Creek Park, D.C., a nutrition laboratory at Boston, Mass., here studies of the metabolism of normal individuals and of iabetics and other researches connected with metabolism are onducted, and a desert laboratory for botanical research at ucson, Arizona. In addition it maintains the Mount Wilson bservatory at Pasadena, California.

LEATHER (*see* 16.330).—Several noteworthy advances have een made since 1910 in the science and practice of leather anufacture.

IMPROVEMENTS IN MANUFACTURING METHODS

New Institutions.—A notable addition to the institutions ngaged more particularly in the study of scientific problems f the leather industry is to be recorded. In 1924 the American anners' Council established a leather research department in e University of Cincinnati as a memorial to members of the dustry who lost their lives in the World War. In the first lace the department is to be devoted to research work, but ventually it will extend its activities to the training of chemists r the industry. A leather research institute has also been stablished at the Darmstadt Technische Hochschule.

New Bating Materials.—Probably the most notable change in he processes of light leather manufacture is to be found in the tilisation of artificial bating or puering materials in place of he natural materials formerly used. In manufacturing soft exible leathers the skins were exposed, after removal of hair r wool, to a bate or puer made by fermenting the excreta of owls or dogs. The researches of J. Turney Wood of Nottingham resulted in the production of a satisfactory substitute from the pancreas of animals, which contains enzymes capable of bringing about most of the desired changes in the skins. Under various proprietary names, and usually mixed with ammonium chloride, pancreatic preparations have superseded the old type of puer to a great extent. The artificial bates are free from the objectionable features inseparable from the use of fermented natural material, are more uniform in composition, and their action upon skins can be better controlled. For a few purposes tanners find that the artificial bate is not entirely satisfactory, but a large proportion of European and American tanneries no longer use the natural bates.

New Tanning Materials.—A great number of new vegetable tanning materials have been brought to the attention of tanners from time to time, but the staple materials now used are not very different from those employed in 1910. The use of mimosa bark as a source of tannin has certainly increased, and this material, grown largely in South Africa, is exported either as such or in the form of a solid concentrated extract of the bark. Several modern extract factories have been erected for this purpose at convenient points in South Africa, and the product competes with the solid quebracho wood extract of South America as a relatively low-priced and efficient tanning material.

The sulphite cellulose liquors, by-products of the paper industry, have found some application in the leather industry. Although not strictly tannins, when suitably treated they combine with hide substance, and have been successfully used in conjunction with ordinary tanning materials in the production of sole leather.

Synthetic Tanning Materials.—As a result of the researches of Dr. E. Stiasny, of the Leather Industries Dept. of Leeds University, synthetic tanning materials have been manufactured and used on a commercial scale, and were particularly useful when the regular supplies of tanning materials were interfered with during the War. In principle the preparation of synthetic tannin is simple. Phenolic bodies such as cresol are treated with sulphuric acid, and under carefully regulated conditions the product is condensed with formaldehyde and partly neutralised with an alkali. The first synthetic tannin of this type was named "Neradol" by Stiasny and manufactured by the Badische Anilin und Soda Fabrik. Various firms now produce similar materials in most European countries and in the United States. The synthetic tannins have many of the chemical properties of tannin, and are capable of converting skin into leather, but they appear to give more satisfactory results in practice when used in conjunction with other tanning materials. A great many modified processes of manufacture have been suggested from time to time, but there is some diversity of opinion amongst tanners as to the merits of synthetic tannins, and in their present form it is improbable that they will replace the natural tanning materials to any great extent.

The Chrome Process.—The chrome tanning process is now utilised in the manufacture of a large proportion of all boot upper leathers. It is estimated that in Great Britain about 80% of such leathers are now chrome-tanned, and this figure probably represents the approximate proportion used in other countries. Chrome-tanned sole leather is now manufactured in appreciable quantity, and as the early disadvantages associated with it have been overcome, a waterproof, non-slipping chrome sole, more durable than the vegetable tanned product, is now produced. It will probably be used in increasing quantity, although more costly to produce than the older type, and this fact may restrict its use.

Use of Pigments.—In the finishing of coloured leathers pigments are now used in increasing quantity, as a more uniformly coloured surface can be obtained than is possible in most cases with coal-tar colours alone. The leather is dyed with solutions of the latter in the ordinary way, and in the final stages of finishing very finely ground pigments suspended in suitable media are sprayed or swabbed over the leather surface. On the highest grade leathers this may be unnecessary, but the appearance of medium and low-grade skins is improved by the treatment.

Machinery.—The developments on the mechanical side of tannery equipment have been concerned chiefly with the improvement of existing types of machinery. Probably the most interesting to the British sole leather tanner is to be found in the perfection of the unhairing and fleshing machinery. Machines which remove hair and flesh from skins and sides (*i.e.*, half hides) have long been available and used in tanneries throughout the world, but the special difficulties connected with the manipulation of heavy whole hides were not met until the Turner Tanning Machinery Co., Ltd., developed the pneumatic roll unhairing and fleshing machine. British sole leather tanners who work whole hides, as distinct from sides, through the earlier processes in the tannery, found this machine particularly useful when manual labour was scarce in 1914–8, and have continued to use it successfully since then.

The Liming of Hides.—Two devices with the same object—the economisation of labour in the liming of hides—have been patented and found some application in sole leather tanneries. In both systems the hides are suspended in pits containing the depilating solution, and in one (Forsare) the liquor is agitated and circulated between the hides by blowing compressed air through perforated pipes fixed at the bottom of the pits. In the other system (Tilston, Melbourne) the liquor is distributed by means of a paddle which moves slowly along the bottom of the pit. The heavy manual labour involved in handling and setting the hides by the orthodox method, where hides are piled in a pit, is avoided, but both of the new systems require a larger pit space for dealing with a given number of hides than does the older method. In the period under review there has been a notable increase in the number of chemists employed in the leather industry, and there are few important tanneries which do not now employ one or more specially trained chemists on their staffs.

(D. McC.)

II. THE TRADE IN LEATHER

The main differences in the distribution of the industry since 1911 affect the position of Great Britain and the United States. Great Britain, with the exception of certain classes of leather, is becoming a bigger producer and much less dependent upon import supplies. Export from the United States has declined in quantity. The rest of the world remains approximately where it was, though there is a tendency to an increase in leather production in those agricultural countries where there is a substantial supply of hides which previously were exported, *e.g.*, South Africa.

World Production of Hides.—There has been a small increase in the world's annual supply of hides, though this increase has not been equal to the rate of increase in population within the same period. Every tanning country has a certain supply of hides of its own, but most of the big ones require to import from other countries. Dividing all countries into the two categories:—(*a*) "tanning countries" and (*b*) "hide exporting countries," there has been an increase in the aggregate in the number of cattle in the "tanning countries" of about 2% on a total of about 200,000,000 which is a rate of increase appreciably less than that of the population of those countries. On the other hand, there has been an increase of about 15% in the aggregate number of cattle in the "hide exporting countries" on a total of about 300,000,000. It is probable, however, that this is an overstatement of the real increase as in one or two countries the pre-War figures were defective.

The most important hide producing country from which heavy leather tanners draw their supplies is Argentina, in which country there has been a substantial increase in the number of cattle, the pre-War figure being 25,800,000 and the latest post-War figure being 37,000,000. In 1913 the export of frozen and chilled beef from the Argentina was only 4,119,000 quarters. In 1921 the figure had risen only to 4,730,000 quarters, but by 1924 the total was 9,547,000 quarters, falling slightly in 1925 to 8,921,000. One of the most significant features about this increase, of considerable interest to tanners in estimating future supplies of hides, is the fact that the increased export has been mainly to the continental countries of Europe. Before the World War Argentina exported practically no beef to th countries, but since the War Germany, Holland, Italy, Belgi and France have all imported beef from Argentina on a su stantial scale. If this indicates a change in social habits these countries leading to an increase in the consumption meat, there is likely to be a further demand for cattle in Sou Africa and Australia, as well as in South American countri which will react favourably upon supplies of hides for tanne

Against this, however, must be set off the diminution in t supply of dry hides from many parts of the world. The hic from the meat works throughout the world are by-products the meat and would come forward in undiminished numbe even if the price obtained for them was substantially less th at present. Dry hides, however, come from the outlying pa of the earth, and frequently the hide has to be carried so hundreds of miles by land before reaching the port. The hides are not forthcoming unless there is satisfactory return f the labour and costs involved, and a distinct relationship c be traced between the price and the supply of dry hides. Duri the period of high prices in 1919, for instance, some millions hides were brought forth which would never have come forwa but for the high prices ruling. Owing to the increase in tran port and handling charges, the return to the original holder the hide now is less than it was before the War, and the dim nution in the supply is to be measured by some millions. Th United States is now taking practically no dry hides, thoug the consumption in Great Britain is being maintained.

Tanning Materials.—The chief tanning material supplie before the War were quebracho extract from Argentina an chestnut extract from various European countries as well as th United States. A rapid increase is shown in the exportation quebracho extract from Argentina and a decline, in compariso with the pre-War figures, in the export of logs, the figures bein as follows:—

	Quebracho Logs	Quebracho Extract
	Tons	Tons
1913	383,964	79,684
1920	56,582	122,837
1921	30,857	120,100
1922	124,822	167,845
1923	113,639	208,586
1924	93,797	216,322
1925	116,940	274,245

Supplies of chestnut, however, are diminishing. In France i particular, exports have fallen very substantially, because th forests in past years have not been properly replanted. Import of chestnut extract into Great Britain from France in 1913 wer 35,800 tons, while the figure for 1925 was only 11,000 tons. I the United States also there is a reduction in the production o chestnut extract, due to the ravages of the chestnut blight.

Against this reduction, however, has to be set off the increase consumption of wattle bark as a tanning agent. The wattl tree, which was indigenous to Australia and was introduced int South Africa in the last decade of the past century, has mad very rapid strides. The Australian industry has fallen to very small dimensions, but the exports of wattle bark from Sout Africa increased from 65,000 tons in 1913 to 121,000 tons in 1922, declining slightly since. In addition to these exports o bark from South Africa, substantial quantities are now converted into extract in South Africa and exported to tanners throughout the world in the form of a solid extract, somewha similar in appearance to quebracho extract. The biggest tanning material company in the world has interested itself in the developments of the South African wattle industry.

Demand for Leather Goods.—On the leather side, there has been a substantial increase in the amount of leather made for the upholstery of motor cars. Although only a relatively small proportion of the cars manufactured in the world are upholstered in leather, the amount of leather required is substantial, and many firms who formerly produced leather for saddlery and harness work have turned over to this class of production.

further change is the production of fancy leather for boot l shoe purposes, and the extensive use of coloured leathers caused considerable difficulty to upper leather manufac- ers, who find that their industry has become one subject to ion. It is probable that the consumption of sole leather in world has not increased, as there have been a substantial nber of substitutes which have made a certain degree of dway. The competition of substitutes against leather for the s of boots, however, is largely an economic one, and with the er prices of hides which have now been reached, it is probable t the field for the substitute will be limited. In belting ther also, in certain countries, substitutes have made head- y, though in the United States, where special propaganda in interest of leather belting has been undertaken, the substi- e has declined in importance. (E. C. SN.)

EBEDEV, PETR NIKOLAJEVICH (1866–1912), Russian sicist, a master of experimental research, was born on Feb. (old style) 1866 in Moscow, son of a merchant. He was edu- ed at a German secondary school and a technical college in scow, and in 1887 went to study physics under Kundt in asbourg. He took his doctor's degree in 1891 and published first research on the Mossotti-Clausius theory of dielectrics. the same year he was appointed assistant in physics at the iversity of Moscow and in 1892 professor. In 1895 he produced y short electric waves and published his work on the double raction of electric rays. He also succeeded in proving, experi- ntally (1899), the existence of the extremely small pressure ich light exercises on bodies. In 1901 appeared his classical rk: *Experimental Research on Light Pressure* (published in 13 in German in *Ostwald's Klassiker*). Finally in 1910 (*Annal- der Physik*, April) he succeeded in measuring this pressure, eoretically determined by Maxwell. In 1911 Lebedev had to ve the university for political reasons, and started, with his pils, a private laboratory. His further work was mainly on origin of the earth's magnetism, but death from heart failure March 1 1912 stopped his ingenious experiments. He founded Moscow the Lebedev Physical Society. In 1913 his *Collected searches* were published in Russian under the auspices of this ciety. (A. FO.)

LE CATEAU, BATTLE OF: *see* FRONTIERS, BATTLES OF THE.

LECOCQ, ALEXANDRE CHARLES (1832–1918), French musical mposer (*see* 16.355), died in Paris Oct. 24 1918.

LEDGER: *see* BOOKKEEPING.

LEE, SIR SIDNEY (1859–1926), a British man of letters (*see* .363), died in London March 3 1926. He was knighted in 1911 d was president of the English Association in 1917. His lec- res on *The French Renaissance in England* were published in 10; and his later works include *Principles of Biography* (1911) d *Shakespeare and the Italian Renaissance* (1915). At the time his death, he was engaged on the second volume of his official ography of *King Edward VII.*, the first volume of which had peared a year previously.

LEE, VERNON (pen-name of Violet Paget)(1856–), British thor, was born in France, of English parentage, on Oct. 14 56. She lived almost entirely near Florence, and was a well- formed and acute student of Italian art, history and literature. er *Studies of the Eighteenth Century in Italy* (1880) is typical of veral books of essays; *Miss Brown* (1884); *Hauntings* (1890); *anitas* (1892); *Sister Benvenuta* (1906); and *Louis Norbert* (1914) e among her novels. *Satan the Waster*, a philosophic trilogy, as an ambitious dramatic satire on war and civilisation (1920), d among many other works may be mentioned *Gospels of narchy* (1908), essays on political subjects, *The Sentimental aveller* (1908) and *The Tower of Mirrors* (1914), essays on the irit of places, and *Proteus, or the Future of Intelligence* (1925).

LEEDS, England (*see* 16.368), had a population of 458,320 1921, and in 1925 it was stated to be nearly 500,000. oundhay, Seacroft, Shadwell and part of Crossgates were in- ded in the borough in 1912, Middleton in 1919, and part of del-cum-Eccup in 1925, making the total area 30,136 acres. In 18 the parliamentary borough was redistributed in six divi- ons, each returning one member. The city museum was acquired by the corporation in 1921 from the Leeds Philosophic and Literary Society. Kirkstall Abbey House, an historic building near Kirkstall Abbey, was bought by the municipality in 1924, and the old Kirkstall bridge over the Aire was replaced by a new bridge in 1912. The corporation owns the fine mansion of Temple Newsam, with an estate of 935 ac., in the Hunslet rural district in the east of the city, where there is a fine collection of arms and art treasures. A farm in connection with the estate has been worked as a municipal dairy farm since 1922. At Middleton 316 ac. have been leased for a public park, and 427 ac. bought for a housing scheme.

In 1924 and 1925 respectively the corporation obtained parliamentary powers to enable them to carry out very extensive street improvements in the city. New office buildings, capable of accommodating a staff of 350, were acquired and equipped in 1925. Under the provisions of the Leeds Corporation Act 1924 the city was constituted one township under a separate board of guardians by the amalgamation of the former townships of Leeds, Armley and Bramley, Holbeck and Hunslet and the former parish of Osmondthorpe. The construction of a reservoir at Leighton, 46 m. distant, was completed in 1926. In 1926 the tercentenary of the granting of the city charter was celebrated.

LEEDS, UNIVERSITY OF (*see* 10.43).—In the period under review, the professorial staff has been strengthened by the institution of chairs in English language, philosophy, medieval history, applied mathematics, physical chemistry, agricultural chemistry, bacteriology, therapeutics and clinical surgery. New departments of Russian and Spanish languages and literatures and of geography have also been established. Provision has been made for the residence of both men and women students. The university now has a hall of residence with accommodation for 120 men and four halls for women with accommodation for about 175 students.

Temporary structures were erected to accommodate the influx of students after the War and private dwelling houses were adapted for various departmental purposes. Considerable additions have been made to the site, however, and the efforts of the university authorities are now being directed to the provision of a range of adequate and permanent buildings. The university council has set aside special funds to aid research in all departments. With the help of grants from the Government, special investigations have been undertaken in animal nutrition, flax-growing, etc. A staff of research chemists has been appointed in the coal gas and fuel industries department, where investigations are carried out in co-operation with the Institution of Gas Engineers and the National Benzole Association. An International Research Laboratory for the leather industries has been established by means of public subscriptions as a memorial to Professor H. R. Procter. Considerable developments have taken place in the department of pathology and bacteriology which works in close association with the Leeds General Infirmary and the Health Committee of the Corporation.

In the department of agriculture a large volume of advisory work is done in the county. More than 1,400 problems were dealt with in 1924, 750 of them involving personal visits. Research is in progress in all branches of agricultural science and organised courses of lectures, demonstrations, etc., are conducted in the three Ridings of Yorkshire. The Rawdon Baptist College, the York Diocesan Training College and the Leeds Central Technical College (printing department) have been affiliated to the university, recognition being given, for purposes of degree work, to certain courses of study at these institutions.

In co-operation with Armstrong College, Newcastle-upon-Tyne, the university, at the request of the North Eastern Railway Company, undertook the conduct of lectures and examinations in connection with the company's educational system—a scheme which has since been extended throughout the area of the London and North Eastern Railway Company's service. Striking developments have taken place in the extramural work of the university. Five tutorial classes were conducted in 1910: in 1925 there were thirty-eight. In addition to these regular, three-year courses, a considerable number of one-year classes, introductory courses, single lectures and extension courses are given each year throughout the university's area. Public lectures are arranged in the university each session on literature, history, art, science, music, etc., while mid-day music recitals have become a regular feature of university life.

Between 1910 and 1914 the average number of students was 650. Between 1914 and 1919 the average fell to 540 but rose in the quinquennium 1919–24 to 1,329. There were 1,435 students in 1925. The appeal for a fund for new buildings produced £263,085 and £124,314 for the development of the university. Sir Edward Brotherton, Bart. gave £20,000 for bacteriological research. The Clothworkers' Company have made capital as well as annual grants amounting in all to £251,333. Sir James Roberts and Lord and Lady Cowdray have been generous benefactors.

LEE OF FAREHAM, ARTHUR HAMILTON LEE, 1st Viscount (1868–   ), British politician, was born at Bridport, Dorsetshire, Nov. 8 1868. Educated at Cheltenham and Woolwich, he entered the Royal Artillery in 1888, retiring with the rank of brevet-major in 1900. From 1893 until 1900 he was professor of strategy and tactics at the Royal Military College in Canada, during which period he organised the military survey of the Canadian frontier. He was British military attaché with the United States army during the Spanish-American War in 1898, and in the following year was military attaché to the British Embassy at Washington. In 1900 he entered the House of Commons as Conservative member for the Fareham division of Hampshire, which he represented for 18 years. He was Civil Lord of the Admiralty from Oct. 1903 until the resignation of the Balfour ministry in 1905. In 1912 he carried through Parliament an Act aimed at the white slave traffic. On the outbreak of the World War he rejoined the army, and served as a colonel on the staff. In 1915–6 he was personal military secretary to the Secretary for War (Mr. Lloyd George) and in 1917–8 director general of food supplies. He was made K.B.E. in 1916, G.B.E. in 1918, in which year he was created baron; and was sworn of the privy council in 1919. He joined Mr. Lloyd George's administration in 1919, first as Minister of Agriculture and then as First Lord of the Admiralty (Feb. 1921–Nov. 1922). In 1922 he was made a viscount. He was a member of the Imperial Cabinet in 1921, a delegate to the Washington Conference, Nov. 1921–Feb. 1922; and in 1923–4 chairman of the royal commission on the public services of India, for which he was created G.C.S.I. in 1925. In 1921 he presented to the nation, as a residence for the prime minister for the time being, the house and estate of Chequers on which subject he writes in this Encyclopædia.

LEFROY, HAROLD MAXWELL (1877–1925), British entomologist, was born at Crondall, Hampshire, Jan. 20 1877, and was educated at Marlborough and King's College, Cambridge, where he graduated in 1898. He early specialised in entomology and became in 1899 entomologist to the Imperial Department of Agriculture for the West Indies, a position which he held until his appointment in 1903 as imperial entomologist for India. In 1912 he was appointed to the newly created chair of entomology at the Imperial College of Science and Technology, South Kensington, and in 1913 he became honorary curator of the insect house of the Zoological Gardens, London. He devoted himself particularly to the study of the life history of insects of economic importance in the field, and as imperial silk specialist for India in 1915 and 1916 he did much valuable work for the silk and cotton industries. During the World War as temporary lieut.-colonel in Mesopotamia he conducted sanitary measures against flies, and in 1917 served as an expert on the royal commission on wheat supplies, dealing effectively with the problem of beetles in wheat. He subsequently devised means of combating the depredations of the death watch beetle in old buildings. He died in London on Oct. 14 1925, poisoned by the fumes of a gas with which he was experimenting for insect destruction.

His publications include *Indian Insect Pests* (1906); *Indian Insect Life* (1909); *A Manual of Entomology* (1923); and articles in *The West Indian Bulletin*, the *Agricultural Journal of India*, and many official papers.

LEGAL EDUCATION (*see* 9.603).—The purpose of this arti is to indicate the main tendencies of legal education in Engla and Wales since 1910, and to trace the general development legal education in the United States from the beginnings to t present day.

I. ENGLAND AND WALES

The most noteworthy feature of the period under review h been the greatly increased interest which law has received at t hands of those interested in education generally. Two princip tendencies have been revealed—first, an increasing demand f scientific legal education for both branches of the legal profe sion; and, second, the serious consideration by educational bodi of the advisability of including elementary instruction in law the curriculum of the ordinary schools.

Systematic legal education is now provided by the older a the newer universities, the Council of Legal Education, the La Society and the approved law schools set up by the Law Socie under the provisions of the Solicitors Act 1922. There are fa ulties or departments of law at the Universities of Oxford, Ca bridge, London, Birmingham, Durham (Armstrong College Leeds, Liverpool, Manchester, Sheffield and Bristol; and depar ments of law at the following university colleges: Aberystwyt Exeter, Nottingham, Leicester, Southampton, Bangor, Swanse and Cardiff. In some cases these faculties and departmen provide qualifying courses for degrees in other faculties. Thu at the university of London, the degree examinations for B.S (Economics) include industrial law, and for bachelor of com merce (B.Com.) commercial law, contract, banking an insurance.

Professional Law Schools.—A degree in law, however, is not i England a professional qualification. Before he can practise, th student must pass in the case of a barrister the examinations the Council of Legal Education, and in the case of a solicitor th Law Society's examinations. The instruction provided by th Council of Legal Education for such Bar students as care to tak advantage of it constitutes a complete curriculum in law. Th organisation is in the hands of a director of studies and a body readers of high standing. Lectures are given in the Inns of Cour lecture rooms. The Law Society from the year 1903 onward has held a school of law at the Law Society, Chancery Lane where lectures and classes under the control of a principal an director of legal studies and a body of readers, lecturers and tu tors have been given to increasing numbers of students both fo the intermediate examination and the final examination of th Law Society, and in lesser numbers for the degree in law at London University.

From 1903 until the passing of the Solicitors Act of 1922 attendance at a law school was entirely voluntary, and a matter o personal choice for each individual articled clerk. By the Ac of 1922, however, subject to certain exceptions, every article clerk, before presenting himself for his final examination at the end of his period of articles, must have attended substantiall for 12 months at an approved law school. To meet this requirement law schools had to be organised in the principal provincial towns.

The contribution of the law schools at Oxford and Cambridge to the cause of legal education is noteworthy. These universities supply practically the whole of the teaching staff engaged on this branch of educational activity as well as the bulk of the research students. Nor are these activities confined to the academic field. At Cambridge there are few colleges that do not possess their law clubs affiliated to the University Law Society; these bodies meet frequently for discussion and debate, and at intervals hold moots. This practice of mooting, which has also been revived in its ancient home, the Inns of Court, is a valuable addition to the practical side of legal education.

Law and General Education.—Apart from the study of law as a professional education, it may be said that educational establishments generally have come to allow a greater importance to the knowledge of law as part of the equipment of every citizen. Considerable attention and prominence has been given to the er by distinguished judges and others, and lectures have given in which the idea has been formulated. It has not een found practicable, however, to introduce elementary nto the average school curriculum, and it may be doubted ner such a suggestion is likely to be carried into effect in ear future. Clearly, only those who are approaching the usion of their school life would be able to profit by such ction, and it is notorious that sixth-form students already a very full curriculum. (E. L. B.*)

II. THE UNITED STATES

erican legal education begins in 1784 (or perhaps 1782), Judge Tapping Reeve of Litchfield, Conn., set up the first l for the teaching of the common law.

rly History.—There had been no legal profession in the ies until the 18th century. Before the revolution a certain er of lawyers had received their training in England, in nns of Court. But a system of courts, manned by lawyers requiring a trained profession to practise before them, was called for by the economic conditions of the colonies until rd the middle of that century; nor were the executive and ative justice, characteristic of the colonial polity, wholly rseded by judicial justice until after the revolution. Legal ation was at a low ebb in 18th-century England. The uni- ties had never taught the law of the land. The medieval m of the Inns of Court had decayed, and the system that obtains had not been set up. Hence there were no good els at hand after the revolution, and American legal educa- had to develop its own methods. So far as the models were lish, they were, first, the purely apprentice training of the r branch of the profession in England (for in general the ed States took the attorney or solicitor for its type, rather the barrister), and, second, the academic lectures on the of the land which began with Blackstone's lectures as Vin- professor at Oxford. This example was followed eagerly merica. Wythe's lectures at William and Mary (1779), on's at the College of Philadelphia, now the University of sylvania (1790), Kent's at Columbia (1793) and Parker's arvard (1815) were of this type. They were not instruction w to prospective lawyers so much as lectures to young lemen as part of their general cultural training. Later this of academic lectures upon law was grafted upon the appren- training which was the first type of legal education in America. fter the revolution, students ceased to go from America to Inns of Court. Then education for the Bar became dis- tly American. Beginning from this point, three stages of lopment may be distinguished. These stages correspond to e periods in American legal history. The method of each e is a response to the needs of the period in which it grew up.

pprentice Training.—First, there is a stage of apprentice ing, either in the office of a practising lawyer or in a law ol organised as an expanded law office and applying office hods of instruction. This sort of training sufficed for the ls of the time immediately after the revolution. The develop- t of judicial justice administered in courts by trained judges d for practitioners who knew the art of the lawyer's craft. n the United States took over English law as the law of its ral commonwealths, in the first instance it took over English l procedure. Except for land law, at the time of the revolu- the greater part of English law was expressed in terms of edure. Thus there was need of lawyers who knew how to g a lawsuit and how to conduct it through the courts. Ap- tice training was adapted to this need. Judge Reeve's law ol grew out of the practice of taking a number of students a country law office where the press of business did not rfere with instruction. Just because it grew out of such a office, the exact date of establishment of the school at Litch- l cannot be fixed.

he law schools of the period were modelled on that institu- . In effect, they were but expanded law offices in which pre- tors who were practising lawyers carried on the teaching side he law office as their chief activity. Such was the Harvard law school, the oldest of the existing law schools in the United States, in its first stage (1817–29).

At this time there was little differentiation of local law. But the whole tendency of the apprentice training was to dwell upon the local and temporary rather than the universal and enduring elements in the body of legal materials, and this unfortunate feature served to develop and entrench many provincialisms in the law of the several states, since, until, much later, the bulk of the profession was apprentice trained. In general the first stage prevailed until Joseph Story began to teach law at Harvard (1829). Also in many parts of the country the simpler needs of a rural or even pioneer society required nothing more than an apprentice-trained profession, so that the method of that stage has persisted in many localities into the present.

College Teaching.—A second stage begins with the appointment of Story as Dane professor at Harvard, and extends until the epoch-making work of Langdell after 1870. There was nothing in the way of a rule-of-thumb apprentice training, which, under 19th-century conditions, could be done better in a law school than in a law office. But with the growth of the law something more than a rule-of-thumb training in practice was required, and the second stage of legal education was a response. From Story to Langdell the law schools continually increased in influence. The accepted mode of training came to be study in a law school in which law was taught by lectures and from text-books with the teaching apparatus of the old-time college.

The era of expansion that followed the adoption of the constitution called for creative juristic activity and creative legislation. Study of substantive law was called for. It was necessary to investigate each item of the common law of England with reference to its applicability to the conditions in the New World. The traditional materials of 17th-century English law had to be reshaped so as to make of them a common law for America. A mere apprentice training could not meet these demands. Text-books had to be written to guide the courts in the new departments of law, which were formative on every hand. These text-books came from the law schools and soon gained the upper hand as the bases of instruction, even where the whole spirit of instruction remained that of the first stage. The best examples of the second stage are the teaching of Story and Greenleaf, and later of Parsons, Washburn and Parker at Harvard, the teaching of Dwight at Columbia, and the teaching of Cooley and his colleagues at Michigan.

Scientific Study of Jurisprudence.—In a third stage there is scientific study of the legal system of English-speaking countries on the basis of the sources. An analytical and a historical method, as methods of a general science of law, are applied to the sources, and thus system is put into each branch and department of the law. By the time of the Civil War the formative period of American law and legal institutions was substantially at an end. With few exceptions, the great text-books that had guided the courts speak from before the Civil War. In the last quarter of the 19th century, law books tend more and more to be mere indexes to the decisions: they cease to be creative. The need of the time had come to be in another direction. Now there was need of systematising the law which had developed in the period of growth. In response to this demand, within less than a decade after the end of the Civil War, Langdell, who was appointed to Story's chair at Harvard in 1870, had inaugurated the method of study from adjudicated cases which has come to prevail in the majority of American law schools of high grade.

This method seeks, through analytical and historical study of the sources, to give a grasp of the traditional art of deciding cases on the basis of reported judicial experience. It teaches the traditional art of developing grounds of decision from the authoritative legal materials. This is the enduring element in Anglo-American law. Conditions in many localities, in which requirements for admission to the Bar are low, and candidates have insufficient preliminary training to enable them to study the sources directly, have led to persistence of the method of lectures and text-book instruction in schools in which the teachers are actively engaged in practice, and hence the spirit is that of apprentice training. In such schools local law and procedure are chiefly stressed. Probably 60% of those who come to the Bar to-day are trained in such schools. (R. Po.*)

LEGIEN, CARL (1861–1920), German labour leader, was born Dec. 1 1861 at Marienburg (West Prussia). A turner by profession, he entered the trade union movement in Hamburg. In 1887 he became president of the turner's association, and in 1890 member of the general commission of the German trade unions. He was president of this commission from Jan. 1 1891 until the general German trade union association was founded in 1919, when he became its president, which he remained until his death. The leading organiser of the German trade union movement, in 1901 he founded the International Trade Union League, being its first secretary from 1903–19. During the World War he prepared the way for the legal recognition of the trade unions, which was granted in Jan. 1918. Together with Leipart, who succeeded to his post after his death, he formed the Arbeitsgemeinschaft (community of labour) at the end of 1918—an institution destined to set on foot the reconstruction of German economic conditions after the War by co-operation between the employers federations and the trade unions, the latter enjoying equal rights. His last great achievement was putting down the Kapp Putsch in March 1920. He died in Berlin Dec. 26 1920. Legien wrote many works on trade union questions, including *Die deutsche Gewerkschaftsbewegung* (1911).

LEGOUIS, ÉMILE (1861–), French scholar, was born at Honfleur on Oct. 31 1861. Educated at Honfleur and in Paris, after teaching for a year at the Collège d'Avranches, he was made *agrégé d'anglais* in 1885. He was next appointed lecturer at Lyons; and after passing his doctorate in 1896, he became professor at Lyons. In 1904 Legouis was appointed special lecturer in English at the Sorbonne. He is the author of many important critical works on English literature.

Among his publications are *Le Général Michel Beaupuy*, with G. Bussière (1891); *La jeunesse de Wordsworth; Étude sur "Le Prélude,"* crowned by the Académie française (1896); *Shakespeare* (1899); *Morceaux choisis de la littérature anglaise*, with M. Beljame (1905); *Chaucer* (1910); *Edmund Spenser* (1923); and with L. Cazamian, *Histoire de la littérature anglaise* (1924). He also collaborated in the translation of Chaucer's *Canterbury Tales*, crowned by the Académie française, 1908.

LEGROS, ALPHONSE (*see* 16.380) (1837–1911), Anglo-French artist, died in London Dec. 8 1911.

LEHÁR, FRANZ (1870–), Hungarian operetta composer, was born at Komárom, Hungary, April 30 1870. After studying at Vienna and Prague, he became a conductor. His opera *Kukuska*, afterwards called *Tatiana*, was performed in 1896, and since then he has written about 30 operettas. The popularity of his music is due to the charm of its melodies; and especially to the orchestration of his waltz themes, which, with their sensuous grace, are typical of 20th century light opera. His most famous musical comedies are *The Merry Widow* (1905) and *The Count of Luxemburg* (1909). He also wrote *The Man with the Three Wives; Gipsy Love; Eva; Alone at Last; The Blue Mazur; Frasquita;* and *Paganini* (1925).

LEHMBRUCK, WILHELM (1881–1919), German sculptor, was born Jan. 4 1881 at Meiderich near Duisburg, the son of a miner. He received his artistic training at the Düsseldorf Academy, lived from 1910 to 1914 in Paris, where he gained recognition for his art, and afterwards resided in Zürich and Berlin. Lehmbruck was a sculptor of great sensibility, and his art, especially in the last phase, is moving in its spirituality and tenderness. His best known works are: "Weibliche Figur," in Duisburg; "Weiblicher Torso," at The Hague; "Frau Lehmbruck," at Essen; "Knieende" at Mannheim; "Grosse Sinnende"; "Grosse Rückblickende"; "Sterbender Krieger"; "Sitzender Jüngling"; "Emporsteigender Jüngling", and a portrait of Fritz von Unruh in Frankfurt. He also produced numerous etchings of high merit. He died by his own hand in Berlin March 25 1919. See Paul Westheim: *W. Lehmbruck* (1919).

LEICESTER, England (*see* 16.393), with a population of 234,143 in 1921, and an area of 8,582 ac., was created a city in 1919, and has grown rapidly, particularly to the south. At Aylestone
a town to accommodate 7,000 to 8,000 people is being
(1926) by the municipality on a site of 206 acres. A schem
been approved by Parliament, and is now being carried ou
the reconstruction of old, and the construction of new st
in the centre of the city, affecting between 700 and 800 build
The erection of a garden city at Braumstone is also con
plated. A measure creating a diocese of Leicester has rece
the royal assent after passing through the National Ch
Assembly and Parliament. It will include the whole of Leice
shire, and St. Martin's Church, constituted a collegiate chur
1922, will be the cathedral. The Harvey Lane Baptist Ch
was destroyed by fire in 1921 and replaced by the mem
hall—completed in 1924. The Church of St. Augustine's, N
foundpool, was finished in 1912, and that of St. James
Greater in 1914. Another new parish was created in 1924, w
the Church of the Holy Apostles was consecrated.

De Montfort Hall, built by the corporation, was opene
1913. In 1921 a University College was founded, the site
buildings in Victoria Road being the gift of Mr. T. Fiel
Johnson. An extensive addition to the colleges of art
technology has been decided upon and to this end certain
joining properties were purchased in 1924. A new central e
tricity station was opened in 1922, and an extension begu
the following year. Leicester is a partner with Sheffield, Nott
ham and Derby in the Derwent Valley Water undertak
The first part of the scheme, which includes 35 m. of aqued
from Derwent Valley to the Ambergate Reservoir, was finis
in 1912.

LEIPZIG, Germany (*see* 16.399), the fourth city of Germ
and a large industrial centre, had a population of 636,485 in 1
including Mockau and Schönefeld, incorporated in 1915; E
ocker-Windorf, Leutsch, Paunsdorf and Wahren, incorpora
in 1922, added a further 32,105 persons to the population.
famous fair has been resumed, and is held yearly in Septem
The university is one of the largest in Germany. The term
station, through which most of the traffic between Prussia
Saxony passes, was completed in 1915; it contains 26 tracks
covers an area of 172,000 feet. After the Revolution there w
serious demonstrations against the Government in the city,
in April 1919 a Soviet republic was set up, but was put do
by government troops in the following month.

LELAND STANFORD JUNIOR UNIVERSITY (Stanf
University) (*see* 16.406).—The work of the university has
recent years been so reorganised that the first two years con
tute a so-called lower division with certain specified requireme
including biology, a course in citizenship, etc. The major
partment system now becomes operative at the beginning of
junior year, and degrees are granted upon the recommendat
of the departments. Stanford sold most of its large ra
properties in 1919, and in 1925 had about $28,000,000 in inve
ment securities. Its educational plant on the campus, toget
with the Stanford Medical School, Lane and Stanford Hospit
Stanford School for Nurses and Lane Medical Library—all
San Francisco—and the Hopkins Marine Station on Monte
Bay, were valued in all at $11,000,000. The medical sch
owed its origin to the fact that the director of the Coo
Medical College in 1910 turned over that institution and
associated Lane Hospital to Stanford.

In addition to the schools of law, medicine, and education a
the graduate school, there have been organised schools in biol
and social science, also in 1925 engineering and a gradu
school of business, and in 1926 a school of letters and a sch
in physical science. In 1921 the Food Research Institute
Stanford University was organised with the help of the C
negie Corp. of New York to make a study of the production,
tribution and consumption of food. New dormitories for m
and women have been recently constructed, so that 1,000 m
and 250 women live in university buildings. There is a housi
scheme by which practically all of the faculty and most of
students live on the campus. Volumes in the library number
377,904 in 1924, of which 57,722 were in the Lane Medi
Library and 27,067 in the Law Library. Herbert Hoover,

uate of Stanford, presented to the university the Hoover
Library, comprising approximately 47,500 volumes and
erous documents covering the history of the World War.
1924–5 the students numbered 3,312, of whom 500 were
en and 591 graduates. Limitation in funds and equipment
lted in restrictions in the body to something over 2,500.
re is now a tuition fee of $75 per quarter, and a tuition note
em enables students to postpone payment until three or
e years after graduation. Military training is not required,
there is a field artillery unit of the Reserve Officers' Train-
Corps, and an ordnance unit was established in 1925. Dur-
the World War, Stanford was represented by 3,000 of its
bers, graduates and undergraduates. A students' army
ning corps unit was organised in the War period. Dr. Ray
an Wilbur became president Jan. 1 1916. (R. L. W.)

EMAÎTRE, FRANÇOIS ÉLIE JULES (1853–1915), French
c and dramatist (*see* 16.408), died in Paris Jan. 21 1915.

EMBERG, BATTLES OF.—Lemberg (Polish, Lwów), the capi-
town of Galicia, was twice during the World War the centre
series of battles. The first series constituted the opening
paign between Russia and Austro-Hungary in Aug. and
t. 1914; it resulted in the defeat of the Austrians and the
upation by the Russians of the whole of Eastern Galicia.
second series was fought some 10 months later during the
at Russian retreat which was started by Mackensen's offen
on the Dunajec in May 1915. It gave Austria re-possession
emberg and of practically the whole of Eastern Galicia.

I. THE BATTLES OF 1914

he main concentration of the Austro-Hungarian forces for
ion against Russia at the opening of war in Aug. 1914 was
de in Central and Eastern Galicia. In the general plan of the
tral Powers the rôle of the Austro-Hungarian Army was to
gage the main Russian forces till the German Army had over-
elmed France and was free to transfer its principal weight to
Eastern theatre.

lternative Policies.—Two main alternatives were open to the
strians, to await attack or themselves to take the offensive.
the former course were chosen, the line of the river San, be-
een the Carpathians and the Vistula, was indicated as the
ongest available position. On this they might well hope by
active defence to hold up the maximum Russian effort for
he time and to win local successes by counter-attack. But
ence entailed not only the abandonment of Eastern Galicia
also the surrender of the passes over the Eastern Carpathians
the opening of a road into Hungary. This might have
ious political consequences. Moreover, in the years preceding
War, the military opinion of almost every country in Europe
proclaimed insistently that offensive action was the solution
all major difficulties in war. Certainly Conrad von Hötzen-
f, the Chief of the Austrian General Staff, optimistic by tem-
rament, was not the man to adopt a defensive attitude willing-
He determined to attack, though the advantages hoped for
m a speedier mobilisation were not secured owing to errors
de during the preliminary deployment against Serbia.

The chosen line of attack was northwards against one flank of
Polish salient; probably Conrad hoped that a German offen-
e might eventually be made from East Prussia against the
er flank of the salient. The problem of supply was not easy,
ce the terrain between the Vistula and Bug rivers, where the
vance was to be made, had been left, at the instance of the
ssian General Staff, without good communications in antic-
tion of the Austrian plan. It was indeed the obvious direc-
n of any invasion of Russia from Galicia, since an advance
twards would leave the lines of communication exposed,
ile to the northeast lay the trackless marshes of the Pripet.

The Rival Forces.—The Austrian main forces were divided into
r armies, of which two, the I. (Dankl) and IV. (Auffenberg),
re to carry out the offensive, directed on Chelm (Kholm) and
blin respectively; the II. (Bohm-Ermolli) and III. (Bruder-
nn) were to be deployed east of Lemberg to hold off the
ssian armies advancing from the Kiev district. The II. Army had, however, been originally dispatched to the Serbian frontier, and was at first represented by one corps only, the XII. (Kövess). North of the Vistula, Kummer's group of Austrian Landsturm and Woyrsch's corps of German Landwehr were to advance on Sandomierz and Dęblin (Iwangorod) respectively, to protect the left flank of the I. Army and to foster a Polish rising in favour of Austria.

The Russians also deployed four armies on their southwestern front. Their plan was almost the exact counterpart of the Austrian. They purposed to hold the Austrian offensive wing by a defensive force of two armies on the line Lublin-Chelm, and to smash the Austrian defensive wing by an offensive group of two armies advancing west from the Kiev military district on Lemberg. Each of the opponents was thus dependent on the power of his defensive wing to resist the shock of the other's striking force long enough to enable him to gain a decision by his main effort.

Both armies had large masses of cavalry, but there was a pronounced difference in their tactics. The Austrian cavalry seldom practised dismounted fire action and were singularly ineffective on foot; the Russian cavalry, on the other hand, fought largely as mounted infantry. The Russian artillery shot well and was far more effective than the Austrian, but the musketry of the Austrian infantryman was better than that of his rival; he was also handier in manoeuvre. The morale on both sides was excellent at the beginning, although that of the Austrian was to deteriorate rapidly under defeat. In the higher command the Russians held the advantage. Ivanov, the generalissimo of the southwestern front, was no strategist, though an experienced and well-loved commander; but his chief of staff, Aleksyeev, was one of the best brains of the Army; and in Ruzski (III. Army), Plehve (V. Army), Brusilov (VIII. Army), and Ewarth (IV. Army) he had under him probably the four ablest army commanders in Russia—certainly the four most successful. Conrad, the virtual Commander-in-Chief of the Austrian armies—the Archduke Friedrich was the nominal head—was a man of determined and obstinate character, but a better strategist in the office than in the field; nor were the Austrian army commanders the equals of the Russian.

Numerically, the Russians had an advantage, though by no means an overwhelming one. The Austrian striking wing, which comprised 350 battalions, 150 squadrons and 150 batteries, was superior in strength to the Russian IV. and V. Armies which had each four corps and two cavalry divisions; but their defensive wing (200 battalions, 170 squadrons, 130 batteries) was considerably inferior to the Russian III. and VIII. Armies, especially before the arrival of the two corps of the II. Army which had been left opposite Serbia.

On Aug. 15, before concentration was complete, the Austrian cavalry pushed forward to ascertain the Russian movements, but gathered little information. On Aug. 20 the I. and IV. Armies began their offensive. The first engagements in the neighbourhood of Krasnik were favourable to the Austrians, the advanced troops of the Russian IV. Army being driven back on Lublin. The Austrian I. Army was strengthened by Kummer's Landsturm Corps, which crossed the Vistula to join it, while Woyrsch's Corps of German Landwehr was in close touch on the left bank of the Vistula. The mission of these two formations to foment an insurrection in Russian Poland had proved fruitless.

Battle of Komarów.—The Austrian IV. Army now became engaged in a battle with the Russian V. Army, which lasted from Aug. 26 to Sept. 1. Assisted by the Archduke Joseph Ferdinand's group, which had been formed from troops of the III. Army to manoeuvre between its left and the right of the IV. Army, Auffenberg attempted a double envelopment of the Russian force. This manoeuvre met with considerable success; a large part of Plehve's Army was at one time surrounded, and escaped only owing to the sudden withdrawal of the Austrian Corps which had seized its line of retreat—a withdrawal actuated by false reports of Russian troops in its rear. The Russian Army was broken in two, part retiring on Chelm and part on Hrubieszów on the Bug. Before the Austrians could gather the fruits of their victory, events in Eastern Galicia occasioned their recall. Losses in the battle were heavy on both sides.

Operations in Eastern Galicia.—Meanwhile the Austrian covering force (II. and III. Armies) had met with disaster. Although the II. Army consisted of one corps only and the III. Army was weakened by the absorption of the Archduke Joseph Ferdinand's group in the Kómarow battle, yet the High Command sent the two armies forward to the attack. They joined battle with the Russian III. and VIII. Armies on Aug. 26 on the line of the Złota Lipa about Złoczów. On the evening of Aug. 27 they were forced to retreat. Reinforced by the VII. Corps from Serbia, they again gave battle on the Gniła Lipa on Aug. 29 and 30, and again suffered defeat. They now fell back through Lemberg, which was evacuated on Sept. 2, and took up a defensive position west of the city on the line of the Wereszyca and the Gródek lakes.

Battle of Gródek—Rawa-Ruska.—The rear of the victorious Austrian I. and IV. Armies was seriously threatened by the failure of the eastern wing. The question now arose of withdrawing the whole of the Austrian forces to the line of the San, or of continuing the battle round Lemberg on a different plan. Conrad chose the bolder course and determined to seek an immediate victory. He ordered the IV. Army to break off pursuit of the Russians and to change front from north to south. The plan was that this army should strike towards Lemberg at the right flank of the advancing Russians, while the II. and III. Armies held them frontally. The complicated wheel of the IV. Army had been executed by Sept. 5. On Sept. 6 it commenced its march southwards, leaving behind a group under the Archduke Joseph Ferdinand to protect its rear. As it advanced south, its left column became engaged with the right of the Russian III. Army and was pinned to the east of Rawa-Ruska, while the centre and right columns, meeting no resistance, continued southwards, and eventually wheeled into line with the Austrian III. and II. Armies, facing east.

Conrad changed his plan again; he had missed with his left, so now, like an obstinate but unskilful boxer, swung his right at the enemy, viciously but ineffectively. On Sept. 7 he ordered the IV. Army to stand fast and hold the Russians to their ground, while the II. and III. Armies left their prepared defensive positions and struck northward at the Russian left wing. A radical change of plan so hurriedly evolved was hardly likely to succeed. The II. and III. Armies could make little ground, while the position of the IV. Army rapidly became untenable. In its rear the I. Army was being forced back from Lublin by the reinforced Russian IV. Army, while the Russian V. Army had rallied and was again advancing, driving before it the Archduke Joseph Ferdinand's weak group. Finally the left wing of the IV. Army itself was being outflanked north of Rawa-Ruska by the Russian III. Army. On Sept. 11 Conrad issued orders for a general retreat to the line of the San.

Austrian Retreat.—The withdrawal was successfully carried out without serious interference by the Russians. The II. Army retired in the direction of Sambor, and the III. towards Przemyśl, the IV. on Jarosław, and the I., together with Kummer's and Woyrsch's forces, to the lower San. The detachments farther east, along the Dniester, retired to the Carpathians. The line of the San was not held for long. The Russian IV. Army had been reinforced by the IX. Army from Warsaw and forced a passage of the lower San on Sept. 14. The Austrians were too shaken and disorganised to enter on a new battle, and resumed their retreat, leaving the fortress of Przemyśl to stand siege. They finally halted on Sept. 26 some 50 m. east of Cracow on the line of the Dunajec by Tarnow and Gorlice to the Carpathians. The Russians, who also required a pause for reorganisation—losses had been very heavy on both sides—made no serious attempt to follow up beyond the San.

Causes of Austrian Failure.—The advantage of "interior lines" which the Austrians enjoyed in this campaign has been partly discounted by the great size of modern armies and the time required to obtain the decision in a battle. It is true that the Germans were at this very period gaining brilliant successes
by action on interior lines against Samsonov and Rennenk
in East Prussia, but their achievements were only rend
possible by the inertia of Rennenkampf. In Galicia, the
tinued pressure by Ruzski's and Brusilov's armies on the
trian detaining wing denied to Conrad the time require
complete his successes in Poland. But the Austrian High
mand appear to have suffered throughout from lack of a
cut plan, and to have depended too much on the course of ev
It is difficult to trace in their original organisation for the
paign any recognition of the need for that "mass of manoeu
capable of being transferred from one wing to the other, wh
the essence of action on interior lines. Also, the ineffective
for delaying action of their masses of cavalry deprived the
trians of a powerful weapon. The Russian scheme of operat
was straightforward and demanded only driving power by
higher commanders and hard fighting and marching by
troops. An opportunity of turning the Austrian retreat in
rout seems, however, to have been missed, when the IX. A
from Warsaw directly reinforced the IV. Army instead of b
directed west of the Vistula on the Austrian line of retreat.

II. THE BATTLES OF 1915

The fighting which led up to the second series of battles ro
Lemberg in the summer of 1915 is described under the hea
DUNAJEC-SAN. After being driven from the San, the Rus
III. Army (now under Lesh instead of Radko Dimitriev)
VIII. Army (Brusilov) took up a position to the northwest
west of Lemberg. Their line ran from the Vistula along
heights north of the Tanew river, thence west of Rawa-Rusk
Magierów and Janów to the Wereszyca river and Gródek la
The XI. and IX. Armies continued the line southeast along
Dniester.

Comparison of Adversaries.—Mackensen's pursuing f
consisted of the Austrian IV., German XI. and Austrian
Armies, in that order from north to south. On the Dniester
Linsingen's Southern Army and Pflanzer-Baltin's VII. Ar
In the number of available formations there was no great
parity between Mackensen's group of armies and the Rus
III. and VIII. Armies; on each side there were about 40 infa
divisions, and the Russians had five or six cavalry division
Mackensen's two. But the two Russian armies now embra
an improvised assembly of formations and units taken from
parts of the line; even so their losses had not been made
and they were much under strength; there was a shortag
ammunition, both for guns and rifles; and morale had natur
suffered under two and a half months of continual defeat.

Austro-German Attack.—As usual, the main thrust at
Russian position was delivered by the German XI. Army.
was directed through Magierów against the line Zólki
Rawa-Ruska, approximately at the joint between the Russ
III. and VIII. Armies. The assault was made on June 19, a
the Russian position had been battered by the German g
and the attackers broke right through to the Rawa-Rus
Lemberg railway. Brusilov held on to a fortified position wes
Lemberg till the 22nd, and then evacuated it under the th
that came from the north and the direct pressure from
Austrian II. Army.

Re-grouping of Armies.—The Russian armies were now s
apart; the VIII. Army retired fighting to the line of the Up
Bug and Gniła Lipa; at the same time the XI. and IX. Arm
gave up the Dniester line below Halicz. The III. Army me
while, to protect the left flank of the Warsaw salient, was for
to retire north towards Lublin and Chełm. To fill the gap
tween the III. and VIII. Armies, a new army, the XIII. un
Gorbatovski, was formed of troops drawn from the right of
III. Army and left of the VIII. The Austrian armies were a
re-grouped; the II. Army, the Southern Army and VII. Ar
were to continue the pursuit eastwards; Mackensen with
IV., XI. and a new "Army of the Bug," to be formed und
Linsingen, was to strike northwards between the Bug and V
tula; while the I. Army, withdrawn from the west of the Vistu
was to fill the gap between the two groups.

he Eastern group drove the Russians back at the beginning uly from the Gnita Lipa to the Zlota Lipa; no farther fighting place here till the end of August. Farther east, Pflanzertin's VII. Army and Lechitski's IX. were engaged in an insive conflict along the Dniester between July 14 and 19. nwhile on Mackensen's front the Austrian IV. Army had heavily counter-attacked near Krasnik by the Russian IV. ny and had been driven back some distance, losing 17,000 oners. The check was only temporary, and so soon as the rouping was completed, Mackensen again advanced. For further operations of this force, *see* BREST-LITOVSK, BATTLES (*See* also EASTERN FRONT CAMPAIGNS.)

ENGLEN, SUZANNE (1899–), French lawn-tennis player, born at Compiègne May 24 1899. She was taught to play is by her father and began to show brilliance at an early age, ing the championship of Picardy when only 14 years old. une 1914 she won the hard court singles and doubles in Paris. ing the World War she played in exhibition matches on the era for the French Red Cross 1916–8. In 1919 she made her appearance at the Wimbledon tournament and won both singles and doubles championships, defeating Mrs. Lambert mbers in the final round. In the following year she won the s' singles at Wimbledon and mixed doubles champion with Patterson. In Aug. 1921, after again winning the singles doubles at Wimbledon, she visited America and was ded (2–6 retired) by Mrs. Mallory in the second round of the A. ladies' singles championships. At Wimbledon however, e following year Mlle. Lenglen defeated Mrs. Mallory 6–2, in the final round of the ladies' singles. In the same year she won the French National Championship, took all three pionships in the Brussels tournament and was undefeated ughout the season. She again won the singles at Wimbledon 23 and 1925, but was obliged to retire in 1924 owing to ill- as she was also in 1926. (*See* LAWN TENNIS.)

ENIN, VLADIMIR ILYICH ULYANOV (1870–1924), founder guiding spirit of the Soviet Republics and the Communist national, the disciple of Marx both in theory and in prac- the leader of the Bolshevik party and the organiser of ct. revolution in Russia, was born on April 9 (22) 1870 e town of Simbirsk, now Ulyanovsk. His father, Ilya laevitch, was a schoolmaster. His mother, Maria Alexana, whose maiden name was Berg, was the daughter of a r. His eldest brother (b. 1866) joined the "Narodovoltze" dom of the People movement),[1] and took part in the ccessful attempt on the life of Alexander III. For this he xecuted in his 22nd year. Lenin, the third of a family of six, leted his course at the Simbirsk gymnasium in 1887, win- the gold medal. His brother's execution, indelibly stamped s consciousness, helped to determine his later life.

the summer of 1887 Lenin entered the Kazan University to law, but was sent down in Dec. of the same year for taking n a gathering of students and was banished to the country- His repeated petitions in 1888–9 for permission to re-enter niversity of Kazan or to be allowed to go abroad to continue udies met with refusal. In the autumn, however, he was d to return to Kazan, where he began the systematic study rx and first entered into relations with the members of the Marxist circle. In 1891 Lenin passed the law examinations St. Petersburg University, and in 1892 he began to practise barrister at Samara. During this year and the next he red for the defence in several trials. His life, however, was chiefly filled by the study of Marxism and its application to the investigation of the course of the economic and political development of Russia and subsequently of the whole world.

In 1894 he moved to St. Petersburg, where he came into touch with the workers and began his propaganda work. To this period belong Lenin's first polemical writings directed against the popular party, who taught that Russia would know neither capitalism nor the proletariat. These were passed from hand to hand in manuscript form. Soon after, Lenin started a theoretical struggle against the falsifiers of Marx, in the legal Press.[2] In April 1895 Lenin first went abroad with the intention of entering into relations with the Marxist group abroad known as the "Osvobozhdenie Truda," "Deliverance of Labour" (Plekhanov, Zasulich, Axelrod). On his return to St. Petersburg, he organised the illegal "Union for the struggle for the liberation of the Working Class," which rapidly became an important organisation, carrying on propaganda and agitation among the workers and getting into touch with the provinces. In Dec. 1895 Lenin and his closest collaborators were arrested. He spent the year 1896 in prison, where he studied the lines of Russia's economic development. In Feb. 1897 he was sent into exile for three years to the Yenisei province in eastern Siberia. At this time, 1898, he married N. K. Krupskaya, his comrade in the work of the St. Petersburg Union and his faithful companion during the remaining 26 years of his life and revolutionary struggle. During his exile he finished his most important economic work, *The Development of Capitalism in Russia*, based on a comprehensive and systematic study of an enormous mass of statistical material (1899). In 1900 Lenin went abroad to Switzerland with the intention of organising, with the "Deliverance of Labour" group, the publication of a revolutionary paper intended for Russia. At the end of the year the first number of the paper *Iskra* (The Spark) appeared in Munich, with the motto "From the Spark to the Flame!" The aim of the paper was to give a Marxian interpretation of the problems facing the revolution, to give the political watchwords of the struggle, and to organise on this basis a centralised "underground" revolutionary party of Social Democrats, which, standing at the head of the proletariat, should open the struggle against Tsarism, rousing the oppressed masses, and, above all, the many millions of peasants.

The idea of an organised party leadership of the struggle of the proletariat in all its forms and manifestations, which is one of the central ideas of Leninism, is closely connected with the idea of the hegemony of the working class within the democratic movement of the country. This idea of hegemony, having become the central point of the Leninist political conception and practical work, found direct expression in the programme of the dictatorship of the proletariat when the development of the revolutionary movement had prepared the conditions for the Oct. revolution.

The second Congress of the R.S.D.R.P. (Brussels, London) in July and Aug. 1903 accepted the programme worked out by Plekhanov and Lenin, but ended with the historic split of the party into Bolsheviks and Mensheviks. Thereupon Lenin entered on his separate path as leader of the Bolshevik section, later the Bolshevik party. The differences, which began at first with questions of party organisation, gradually extended to fundamental questions concerning tactics and finally to the question of the party programme. The Mensheviks tried to bring the policy of the Russian proletariat into line with that of the liberal bourgeoisie. Lenin saw in the peasantry the closest ally of the proletariat. The occasional agreements and closer relations with the Mensheviks failed to arrest the constant widening of the two lines—the revolutionary and the opportunist—the proletarian and the petty bourgeois. The struggle with the Mensheviks forged the policy which led to the break with the Second International (1914), to the Oct. revolution (1917) and to the change of the party's name from the compromised title of Social Democrat to that of Communist (1918).

A revolutionary situation was created in the country by the defeat of the army and navy in the Russo-Japanese War, the shooting of the workers on Jan. 9 (22) in 1905, by the agrarian disturbances and the political strikes. Lenin's programme was the preparation of an armed rising of the masses against Tsarism, the creation of a provisional revolutionary Government which was to organise the revolutionary democratic dictatorship of the workmen and peasants for the radical deliverance of the country from Tsarism, serfdom and all medieval rubbish. Accordingly, the third congress of the party, consisting exclusively of Bolsheviks (May 1905), passed a new agrarian programme which included the confiscation of the domains of the landowners and the Tsar.

---

[1] Narodovoltze was a revolutionary terrorist society.

[2] As distinct from the Press which was published illegally—"underground" by revolutionaries.

In Oct. 1905 the All-Russian strike began. On the 17th of the month the Tsar issued his manifesto about the "Constitution." In the beginning of Nov. Lenin returned to Russia from Geneva, and already, in his first article, appealed to the Bolsheviks, in view of the new situation, to increase the scope of their organisation and to bring into the party wider circles of workers, but to preserve their illegal apparatus in anticipation of the counter-revolutionary blows which were inevitable. In Dec. Tsarism began to counter-attack. The rising in Moscow at the end of Dec., lacking as it did the support of the army, without simultaneous risings in other towns and sufficient response in the country districts, was quickly suppressed.

In the events of 1905 Lenin distinguished three main features—(1) the temporary seizure by the people of real political freedom, real in the sense of not being limited by their class enemies, apart from and in spite of all existing laws and institutions; (2) the creation of new and as yet only potential organs of revolutionary power in the shape of soviets of workers', soldiers' and peasants' deputies; (3) the use of force by the people against those who had employed it against them. Those conclusions, from the events of 1905, became the guiding principles of Lenin's policy in 1917 and led to the dictatorship of the proletariat in the form of the Soviet State.

The suppression of the Dec. rising in Moscow threw the masses into the background. The Liberal bourgeoisie came to the front. The epoch of the first two Dumas began. At this time, Lenin formulated the principles of the revolutionary exploitation of parliamentary methods in immediate connection with the struggle of the masses and as a means of preparation for a fresh attack.

In Dec. 1907 Lenin left Russia, to return only in 1917. Now (in 1907) began the epoch of victorious counter-revolution, prosecutions, exile, executions and emigration. Lenin led the struggle against all decadent tendencies among the revolutionaries; against the Mensheviks, the advocates of the liquidation of the "underground" party—hence those known as "liquidators"—and of the change of their methods of work into purely legal ones within the framework of the pseudo-constitutional régime; against the "conciliators" who failed to grasp the complete antagonism between Bolshevism and Menshevism and tried to take up an intermediate position—against the adventurist policy of the Socialist revolutionaries who tried to make up for the inertia of the masses by personal terrorism; finally, against the narrow partisanship of a part of the Bolsheviks, the so-called "callers-off," who demanded the recall of the Social Democratic deputies from the Duma in the name of immediate revolutionary activity, though conditions at that moment offered no opportunity for this. In this dim epoch Lenin showed very vividly a combination of his two fundamental qualities—that of being an implacable revolutionary at bottom, while yet remaining a realist who made no mistakes in the choice of methods and means.

At the same time, Lenin carried on an extensive campaign against the attempt to revise the theoretic basis of Marxism on which his whole policy was founded. In 1908 he wrote a major treatise dealing with the fundamental questions of knowledge and directed against the essentially idealistic philosophy of Mach, Avenarius and their Russian followers, who tried to unite empiric criticism with Marxism. On the basis of a deep and comprehensive study of science Lenin proved that the methods of dialectical materialism as formulated by Marx and Engels were entirely confirmed by the development of scientific thought in general and natural science in particular. Thus Lenin's cons revolutionary struggle, in which he never lost sight of the sma practical details, went hand in hand with his equally cons theoretical controversies, in which he attained to the grea heights of comprehensive generalisations.

The years 1912–4 were marked in Russia by a fresh outb of activity in the workers' movement. Breaches made t appearance in the counter-revolutionary régime. At the be ning of 1912 Lenin summoned a secret conference of the Rus Bolshevik organisations in Prague. The "liquidators" declared to be outside the party. The split with the Menshe became definite and final. A new central committee was elec Lenin organised from abroad the publication in St. Petersbu a legal newspaper, *Pravda*, which in its constant conflict with censorship and the police exercised a guiding influence on vanguard of the working class. In July 1912 Lenin, together his closest collaborators, moved from Paris to Cracow in ord enable him to be in closer touch with Russia. The revolutio movement in Russia was growing, and was thereby giving Bolsheviks the preponderance. Lenin, in active contract Russia, sent articles under different pseudonyms almost e day to the Bolshevik legal newspapers, drawing the inevit inferences from them in the illegal ("underground") Press. this time, as well as before and after it, N. K. Krupskaya, a nearest helpmate, was the centre of the organising work. received comrades coming from Russia, gave instructions to ot on their way there, set up "underground" connections, w conspirative letters, coded and decoded. It was in the s town of Poronin in Galicia that the declaration of war fo Lenin. The Austrian police suspected him of being a Russian and arrested him, but he was released after a fortnight expelled to Switzerland.

A new and wider phase of Lenin's work now opened. It an international scope. Lenin's manifesto, published in the n of the party on Nov. 1 1914, denounced the imperialistic c acter of the War and the war guilt of all the great powers, wh long past had been preparing a sanguinary struggle for the pose of widening their markets and destroying their rivals. patriotic agitation of the bourgeoisie on both sides, who t the blame each upon the other, was shown to be a manoeuv deceive the workers. The manifesto points out that the maj of Social Democratic leaders were now on the side of the b geoisie of their own country, thus violating the resolution o International Socialist congresses and bringing about the d fall of the Second International. It points out that from point of view of the Russian Social Democrats the defe Tsarism would be the most desirable issue of the War. defeat of their "own" governments should be the slogan o Social Democrats of all countries. Lenin subjects to a mer criticism not only Socialist patriotism, but different shad pacifism which dreams of peace but capitulates to war, and, occupied with platonic protests, withdraws from the revolutio struggle with Imperialism. The struggle with pacifism dev into a great struggle with centrism, that is, with those elem of the working class movement which are midway betwee Social Democrats and the Communists, supporting the form actual practice (for instance, the I.L.P. in Great Britain).

The theorists and politicians of the Second Internat redoubled their accusations of anarchism which they had b brought against Lenin. As a matter of fact, all Lenin's the and practical work, both up to 1914 and after, was characte by a twofold struggle, on the one hand with reformism w from the beginning of the War gave its support to the imper policy of the propertied classes, and on the other hand anarchism and all the different varieties of revolutio adventurists.

On Nov. 1 1914 Lenin promulgated a programme for the ation of a new International "to undertake the task of orga the forces of the proletariat for the revolutionary attac capitalist governments, for the civil war against the bourge of all countries, for the attainment of political power and victory of Socialism."

n Sept. 1915 (Sept. 5 and 8) there was held at Zimmerwald in tzerland the first conference of European Socialists who were osed to the imperialistic war. Thirty-one delegates were ent. The left wing of the Zimmerwald conference and of the r one at Kiental adopted Lenin's demand for the transforma- of the imperialist war into a civil war, and became the eus of the future Communist International. The latter ked out its programme, tactics and organisation under in's guidance, and it was Lenin who directly inspired the sions of the first four congresses of the Communist Inter- onal.

enin was prepared for his struggle on an international scale only by his profound knowledge of Marxism and his experi- of the revolutionary struggle and party organisation in sia, but also by his intimate acquaintance with the workers' ement throughout the world. For many years he had fol- d closely the internal affairs of the most important capitalist es. He was a thorough master of the English, German and ich languages, and could read Italian, Swedish and Polish. realistic imagination and political intuition often enabled to reconstruct a complete picture from isolated phenomena. n was always firmly opposed to the mechanical application e methods of one country to another, and he investigated decided questions concerning revolutionary movements, not in their international interreactions, but also in their con- national form.

e revolution of Feb. 1917 found Lenin in Switzerland. His mpts to reach Russia met with the decided opposition of the sh Government. He accordingly decided to exploit the gonism of the belligerent countries and to reach Russia ugh Germany. The success of this plan gave occasion to n's enemies for a fierce campaign of slander, which, however, powerless to prevent him from assuming the leadership of arty and shortly afterwards of the revolution.

n the night of April 4, on leaving the train, Lenin made a h in the Finlyandsky station in Petrograd. He repeated developed the leading ideas it contained in the days which wed. The overthrow of Tsarism, he said, was only the first in the revolution. The bourgeois revolution could no r satisfy the masses. The task of the proletariat was to to strengthen the power of the Soviets, to rouse the country icts and to prepare for the conquest of supreme power in the of the reconstruction of society on a Socialist basis.

is far-reaching programme was not only unwelcome to those ged in propagating patriotic Socialism, but even roused sition among the Bolsheviks themselves. Plekhanov called n's programme “crazy.” Lenin, however, built up his not on the inclinations and views of the temporary leaders revolution, but on the interrelations of the classes and the of mass movements. He foresaw that the distrust of the geoisie and of the Provisional Government would grow ger daily, that the Bolshevik party would obtain a majority Soviets and that the supreme power would pass into their . The small daily *Pravda* became at once in his hands a ful instrument for the overthrow of bourgeois society.

policy of coalition with the bourgeoisie pursued by the tic Socialists, and the hopeless attack which the Allies the Russian Army to assume at the front—both these the masses and led to armed demonstrations in Petrograd first days of July. The struggle against Bolshevism became intense. On July 5th grossly forged “documents” were hed by the counter-revolutionary secret service. These rted to prove that Lenin was acting under the orders of the an general staff. In the evening “reliable” detachments oned from the front by Kerensky and Cadet officers from stricts round Petrograd occupied the city. The popular nent was crushed. The hounding of Lenin reached its . He now began to work “underground,” hiding first in grad with a worker's family and then in Finland; he man- however, to keep in touch with the leaders of the party.

July days and the retributions which followed aroused a of energy in the masses—Lenin's forecast proved right in every particular. The Bolsheviks obtained a majority in the Soviets of Petrograd and Moscow. Lenin demanded decisive action to seize the supreme power, and on his side began an unremitting fight against the hesitations of the leaders of the party. He wrote articles and pamphlets, letters, both official and private, examining the question of the seizure of supreme power from every angle, refuting objections and dispelling doubts. He drew a picture of Russia's conversion into a foreign colony if the policy of Miliukov and Kerensky continued, and he predicted that they would consciously hand over Petrograd to the Germans in order to destroy the proletariat. “Now or never!” he repeated in passionate articles, letters and interviews.

The rising against the Provisional Government coincided with the opening of the second Congress of the Soviets on Oct. 25. On that day, Lenin, after being in hiding for three and a half months, appeared in the Smolny[1] and from there personally directed the fight. In the night sitting of Oct. 27 he proposed, at the session of the Congress of the Soviets, a draft decree about peace which was passed unanimously and another about the land, which was passed with one dissentient and eight abstentions. The Bolshevik majority, supported by the left wing of the Socialist revolutionaries, declared that supreme power was now vested in the Soviets. The Soviet of People's Commissaries was appointed, with Lenin at their head. Thus Lenin passed straight from the log cabin where he had been hiding from persecution to the place of highest authority.

The proletarian revolution spread quickly. Having obtained the land of the landed estate owners, the peasants forsook the Socialist revolutionaries and supported the Bolsheviks. The Soviets became masters of the situation both in the towns and the country districts. In such circumstances the constituent assembly which was elected in Nov. and met on Jan. 5 appeared a patent anachronism. The conflict between the two stages of the revolution was now at hand. Lenin did not hesitate for an instant. On the night of Jan. 7 the All-Russian Central Executive Committee, on Lenin's motion, passed a decree dissolving the constituent assembly. The dictatorship of the proletariat, said Lenin, meant the greatest possible degree of actual and not merely formal democracy for the toiling majority of the people. For it guaranteed to them the real possibility of utilising their abilities, putting as it did in the hands of labour all those material goods (buildings for meetings, printing presses and so on) lacking which “liberty” remains an empty word and an illusion. The dictatorship of the proletariat in Lenin's view is a necessary stage in the abolition of class divisions in society.

The question of war and peace provoked a new crisis in the party and the governing body. A considerable proportion of the party demanded a “revolutionary war” against the Hohenzollerns, leaving out of account altogether the economic situation of Russia and the temper of the peasantry. Lenin felt that it was necessary for propaganda purposes to drag out negotiations with the Germans for as long as possible. But he demanded that, in the event of a German ultimatum, peace should be signed even at the price of a loss of territory or the payment of an indemnity —“Let us give way in space, but gain time,” he said. The revolution kindling in the west would sooner or later undo the hard terms of peace. Lenin's political realism manifested itself in all its strength in regard to this question. The majority of the Central Committee in opposition to Lenin made a further attempt to avoid yielding to German Imperialism by declaring the state of war at an end, but refusing at the same time to sign an imperialistic peace. This led to a renewed attack by the Germans. After heated debates in the Central Committee at the sitting of Feb. 18 Lenin won a majority for his proposal that negotiations should be reopened forthwith, and that the German terms which were now still more unfavourable should be signed.

The Soviet Govt. on Lenin's initiative transferred itself to Moscow. Peace having been attained, Lenin now brought before the party and the country the whole question of its economic and cultural organisation.

---

[1] Smolny, originally an institute for the daughters of noblemen, was the headquarters of the Bolsheviks during the revolution.

The greatest trials, however, were still to come. A counter-revolutionary movement was approaching from the borders. By the end of the summer of 1918 Central Russia found itself surrounded by a ring of fire. Hand in hand with the Russian counter-revolution there came the rising of the Czechoslovaks on the Volga; on the north and south came the British intervention (in Archangel on Aug. 2, in Baku on Aug. 14). Food supplies were cut off. In these conditions of unexampled difficulty, when things seemed hopeless, Lenin never even for so much as an hour ceased to direct his party and the Government. He estimated the extent of each new danger and showed the way to safety. He carried on propaganda work in meetings and in the press, roused ever new forces from among the masses, organised the sending of the workers into the country to get corn, directed the creation of new war divisions, followed the enemy's movements on the map; he was in direct telegraphic communication with the young divisions of the Red Army and looked after their equipment and supplies from the centre. He followed the international situation, finding his bearings by the dissensions in the camps of the imperialists. At the same time he found time for attentive interviews, both with the first foreign revolutionaries who appeared on Soviet soil and with Soviet engineers about plans for electrification or for new methods of utilising peat or of developing a system of radio stations, and so on and so on.

On Aug. 30 the Socialist-revolutionary Kaplan aimed two shots at Lenin when on his way to a workers' meeting. This attack intensified the civil war. Lenin's strong constitution quickly recovered from the effect of his wounds. During his convalescence he wrote a pamphlet, *The Proletarian Revolution and the Renegade Kautsky*, directed against the most prominent theorist of the Second International. By Oct. 22 he was again speaking in public.

The war on the home fronts remained as before his chief occupation. Economic and administrative problems had necessarily to take a subordinate place. The civil war fed from abroad was at its height. It was only thanks to Lenin's titanic energy, clear vision and unshaken will that the struggle ended (at the beginning of 1921) with the utter defeat of the counter-revolution. The Government grew in strength. The main instrument of the struggle as also of the further constructive work always was and still remains the party organised by Lenin—the party which received a thorough apprenticeship during its period of work "underground." The hard school of the civil war produced seasoned main cadres of organisers.

Lenin always considered the Oct. revolution from the standpoint of the European and world revolution. The fact that the War had not led immediately to a proletarian revolution in Europe had enormously increased the difficulties of Socialist reconstruction. The roots of these difficulties lay in the interrelation between the town and the village. This roused Lenin at the beginning of 1921 once again to consider the problems of the internal economic régime. The Socialist reconstruction of society was impossible without agreement between the proletariat and the peasantry. It was therefore essential to change radically the régime of "war communism" produced by the civil war. The system of requisitioning superfluities from the peasants must be replaced by a tax correctly assessed. Private interchange of commodities must be allowed. These measures, introduced by Lenin with the full concurrence of his party, began a new phase in the development of the Oct. (Nov.) revolution, that known as the "new economic policy." Lenin pointed out subsequently that such a policy—with of course the necessary modifications—would be an inevitable phase in the Socialist reconstruction of every country.

In his policy within the Soviet Federation Lenin paid the greatest attention to the position of the nationalities which had been oppressed under Tsarism, and he tried in every way to create for them the conditions of free national development. Lenin made unsparing war against all imperialist tendencies within the state organisation, and especially within the party itself—the purity of whose ideas he guarded with the utmost jealousy. The charges of oppressing nationalities made against Lenin and his party with reference to Georgia, etc., were by means the product of any national struggle, but of the sh class warfare within the nation.

The principles of national self-determination, which in western European working class movements extend only to national minorities of the so-called civilised countries, Le insisted on applying in full to the colonial peoples, and he ch pioned their right to separate themselves completely from t mother country. His doctrine was that the Western Europ proletariat should refrain from mere declarations of sympa with oppressed nationalities, and instead should join them in struggle against imperialism.

At the eighth congress of Soviets (1920) Lenin made a rep on the work carried out on his initiative for the drafting of a p for the electrification of the country. The gradual effort towa a high degree of technical development is the mark of the succ ful transformation from the system of small scale peas economy, with its lack of co-ordination, to the system of la scale Socialist production based on a single, comprehensive p "Socialism is a Soviet Govt. plus electrification."

The exhaustion brought on by excessive hard work ove number of years ruined Lenin's health. Sclerosis attacked cerebral arteries. At the beginning of 1922 his doctors forb him daily work. From June to Aug. the disease made ra progress, and for the first time he began to lose, altho transiently, the power of speech. At the beginning of Oct. health had so much improved that he once again returne work, but not for long. His last public utterance ends with expression of his conviction that "from Russia under N. will come Socialist Russia."

On Dec. 16 he became paralysed in the right arm and However, during Jan. and Feb. he still dictated a numbe articles of great importance for the policy of the party on struggle against bureaucracy in the Soviet and party orga tion; on the importance of co-operation in gradually bringing peasants into the Socialist organisation; on the struggle aga illiteracy; and finally on the policy in regard to national oppressed under Tsarism.

The disease progressed and he lost completely the powe speech. His work for the party came to an end, and very his life also. Lenin died on Jan. 21 1924, at 6:30 P.M., at Go near Moscow. His funeral was the occasion for an unexam manifestation of love and grief on the part of millions.

The main work of Lenin's life was the organisation of a p capable of carrying through the Oct. revolution and of dire the construction of Socialism. The theory of the prolet revolution—the methods and tactics to be pursued—consti the fundamental content of Leninism which as an internati system forms the culminating point of Marxism. Lenin's s aim filled his life from his school days onwards. He never hesitation in the fight against those he considered the enemi the working class. In his passionate struggle there was never personal element. He fulfilled what he considered to b demands of an inevitable historical process. Lenin combine ability to use the materialistic dialectic as a method of scien orientation in social developments with the deep intuition true leader.

Lenin's outward appearance was distinguished by simpl and strength. He was of middle or rather below the mi height, with the plebeian features of the Slavonic type of brightened, however, by piercing eyes; and his powerful head and his still more powerful head gave him a ma distinction. He was tireless in work to an unparalleled de His thoughts were equally concentrated whether in his Sib exile, the British Museum or at a sitting of the People's missaries. He put the same exemplary conscientiousness reading lectures in a small workmen's club in Zurich an organising the first Socialist State in the world. He appreci and loved to the full science, art and culture, but he never fo that as yet these things are the property of a small mino The simplicity of his literary and oratorical style expresse extreme concentration of his spiritual forces bent on a single n personal intercourse Lenin was even-tempered, courteous and ttentive, especially to the weak and oppressed and to children. Iis way of life in the Kremlin was little different from his life as n emigré abroad. The simplicity of his daily habits, his asceti- ism in regard to food, drink, clothes and the "good things" of fe in general in his case did not spring from so called moral rinciples, but came about because intellectual work and intense ruggle not only absorbed his interests and passions but also ave him such intense satisfaction as to leave no room for sub- diary enjoyments. His thoughts never ceased to labour at the sk of freeing the workers till the moment of its final extinction.

His works include: *Ekonomicheskoye soderzhaniye narodnich- tvai Kritika evo v Knige g. Struve, 1895* (The Economic Content the popular party and Mr. Struve's criticism of it. The reflection Marxism on bourgeois literature); *K Kharakteristike ekonomiches- wo romantisma* (1897) (The characteristics of economic romanti- sm), Sismondi and our Sismondists; *Razvitiye Kapitalisma v ossie*, 1899 (The development of Capitalism in Russia). The process making a home market for large scale industry; *Chto Dyelat*, 1902. Vhat is to be done? French trans. *Que Faire?* The most urgent estion of our movement; *Dve taktiki sotsial—demokratii v mokraticheskoi revolyutsii*, 1905 (Two tactics of the Social Democ- cy in the democratic revolution); *Agrarnaya programma sotsial mokratii v pervoi russkoi revolyutsii 1905–1907* (1907), (The agrarian ogramme of the Social-Democrats in the first Russian revolution 05–7); *Za 12 let.*, 1908 (During 12 years), Two tendencies in ussian Marxism and Russian Social Democracy); *Materialism i piriokrititsism*, 1909 (Materialism and empiriocriticism). Critical servations on a reactionary philosophy; *Krakh II. Internatsionala*, 15 (Collapse of the Second International. Eng. trans., 1919; *tsialism i voina*, 1915 (Socialism and War. In collaboration with noviev. German trans., 1915); *Imperialism, Kak noveishii etap. pitalisma, 1917* (Imperialism, the final stage of capitalism); ench trans., 1923; *Pisma o taktike*, 1917 (Letters about tactics); *roki revolyutsii*, 1917 (Lessons of the Revolution. Eng. trans., 18; German trans., 1921); *Gosudarstvo i revolyutsiya*, 1917 (The ite and revolution. Engl. trans., 1919). The Marxist doctrine out the state and the tasks of the proletariat in a revolution. ench. trans., 1919; German trans., 1918; *Grozyashchaya Katas- fa i Kak c nei borotsya*, 1917 (The catastrophe which threatens us d how to struggle with it. French trans., *La catastrophe imminente es mesures de la conjurer*, 1918). German trans., 1918; *Uderzhat li sheviki goeydarst vennuyu vlast?* 1917 (Will the Bolsheviks main- n power? German trans., 1921); *Proletarskaya revolutsiya i renegat utskii*, 1918. (The proletarian revolution and Kautsky the negade. Eng. trans., 1920); French trans., 1919; German trans., 18; *Vybory v Uchreditelnoye Sobraniye i diktatura proletariata*, 19. (The dictatorship of the Proletariat and elections to the Con- tuent Assembly. Eng. trans., 1920); German trans., 1920; *tskaya bolezn "levisny" v kommunisme*, 1920 ("Left Wing mmunism, an infantile disorder." Eng. trans., 1921; French ns., 1921; German trans., 1921); *Krizis v partii*, 1921 (The Crisis the Party); *O prodnaloge*, 1921 (On the tax in kind. German ns.); *Stranichki iz dnevnika*, 1923 (Pages from my diary); *O operatsii*, 1923 (On co-operation. French trans. Sur la Coopération, 4); *Luchshe menshe, da luchsche*, 1923 (Better little but good); *raniye sochinenii T.T. 1–19*, 1921–4 (collected works in 19 vol.). There are two German editions of Lenin's collected works— *sgewählte Werke Sammelband*, 1925, and *Auswahl aus seinen rken.* (L. T.)

ENINGRAD: *see* PETROGRAD.

EONCAVALLO, RUGGIERO (1858–1919), Italian composer 16.455), died at Montecatini Aug. 9 1919.

EPROSY (*see* 16.479).—Since 1910 a new and more hopeful in the 3,000-year-old leprosy problem has been opened up by discovery of an improved treatment of at least the earlier ges of the disease. It still remains a great scourge, recent mates placing the world's lepers, including early little recog- d cases, at two to three millions, the great majority being met h in tropical and subtropical Asia and Africa, the last having highest numbers in proportion to population.

eprosy is most prevalent in hot damp climates, and least in dry areas, humidity being apparently favourable to the vival of the lepra bacillus and its transmission to others, usu- through long and close contact, 40% of traced infections g due to living in the same house and 30% more to sleeping he same bed with a leper. Children and young adults are t susceptible. The disease is less infectious than tubercu- s, and many advanced crippled nerve cases lose their infec- ty. One-third of the isolated lepers in South African institu- s were recently released on this account, with great reduction in expenditure and in opposition to segregation, which is only necessary in infective stages, and has resulted in the reduction of the lepers in Norway to only 5% of the numbers known in 1856, when it was introduced there. Sweden and Iceland show very similar results. Under the more difficult conditions in poor tropical countries such as Hawaii and the Philippines, and in the absence of an effective treatment, the effects of this policy have not been so good and it has led to hiding of the earlier and more amenable cases, from whom infections may arise before they are discovered and isolated.

Treatment.—Numerous suggested remedies, including nastin, having failed to fulfil their early promise, only the old Indian drug, chaulmoogra oil, was known to have some power of retarding the progress of the disease by such doses as could be taken orally on account of its nauseating properties. But slightly better results were obtained by Victor G. Heiser in the Philippines by prolonged painful courses of intramuscular injections of the oil, which few patients would submit to. Real advance was made in 1916–7 when L. Rogers injected the soluble sodium salts of the fatty acids of chaulmoogra and other oils intramuscularly, and still better intravenously. This produced febrile and local reactions, accompanied by extensive destruction of the lepra bacilli in the diseased tissues, with subsequent absorption and eventually complete disappearance of the nodules and the organisms in a considerable proportion of not very advanced cases.

Dean and Hollmann at Honolulu soon after introduced the practically important modification of using intramuscular injections of ethyl esters in place of the more troublesome intravenous ones of the sodium salts, enabling a larger number of cases to be treated. The result was that in the last four recorded years the number of cases discharged as recovered by a board of medical experts, has numbered 53% of the 399 admissions during the same period, and the total lepers, including advanced incurable cases among whom the mortality is high, are being reduced at a rate which will nearly solve the problem in Hawaii within about 25 years.

Further, at the great Culion leper settlement of the Philippines a little over 4,000 cases in all stages have been treated during the last two or three years, and 645 have already cleared up and are bacteriologically negative. Good progress is also being made in many other countries. Many early cases are now coming forward, for the first time in the age-long history of leprosy, in the early amenable stages and asking for admission to the leper institutions in order to obtain the new treatment. They consequently recover before they have reached the more infective stages, cutting short numerous foci of infection in the houses. Active research work, still further to improve the treatment, is going forward in several important centres. The disheartening old asylums for hopelessly advanced and often quite harmless uninfective lepers are giving place to agricultural colonies, much on the lines of tuberculosis sanatoria for the infective cases amenable to treatment.

Hospital clinics are being established to enable the early uninfective cases to be treated as out-patients without the cost and disadvantages of separation from friends and relatives, and only sufficient funds and organisation are required to enable this loathsome disease to be reduced to negligible proportions in many parts of the world within a very few decades. (See F. Oldrieve, *India's Lepers*, 1924.) (L. Ro.)

LEROY-BEAULIEU, HENRI JEAN BAPTISTE ANATOLE (1842–1912), French publicist (*see* 16.485), died in Paris June 16 1912.

LEROY-BEAULIEU, PIERRE PAUL (1843–1916), French economist (*see* 16.485), died in Paris Dec. 9 1916.

LEVASSEUR, PIERRE ÉMILE (1828–1911), French economist (*see* 16.505), died July 9 1911.

LEVELLING: *see* SURVEYING.

LEVERHULME, WILLIAM HESKETH LEVER, 1ST VISCOUNT (1851–1925), British man of business born at Bolton Lancs. Sept. 19 1851, was the son of James Lever, a grocer. His education, received at the Bolton Church Institute, was cut short in 1867 when he went into his father's wholesale warehouse as an apprentice. With his zeal for knowledge and a wonderful memory, he utilised every opportunity for self education, attending evening classes for shorthand, drawing, French and chemistry, and interesting himself particularly in accountancy, pictorial art and architecture. Persuading his father to make him his commercial traveller, he showed such capacity that in 1874 he was taken into partnership and was thus able to marry the friend of his childhood, Elizabeth Ellen, daughter of Mr. Crompton, linen draper, of Bolton.

In 1877, having foreseen that important economies in transport of goods could be effected by opening a branch of the business in Wigan, he established a centre there which ultimately became more profitable than the Bolton headquarters. It was doing so well in 1884 in the hands of his father and capable assistants that he was on the point of abandoning it to them and seeking a fresh field for his activities; but refreshed by a holiday in the Isle of Lewis he returned to the Wigan shop "full of ideas about soap." These "ideas," it soon appeared, could not be realised until he had personal control of the manufacture. He accordingly leased a small soap works at Warrington, which had previously been carried on at a loss, and speedily, by his energy, activity and general good management, transformed it into a well-organised, flourishing business, with London branch premises and agents all over the country, well encouraged and supported by their chief's extensive advertising schemes of striking novelty and enterprise.

Soon, a freehold site where he would have more space for expansion became urgently necessary, and this he found for himself, near Bebington, Cheshire, where on Bromborough Pool Mrs. Lever on March 3 1888 cut the first sod for the foundations of Port Sunlight, the now famed model industrial village—a conspicuous example of successful town planning, with parks, tree-bordered thoroughfares, open spaces and halls, institutions and dwelling houses of great and varied architectural interest, the last named well adapted in size to the needs of the occupants, and provided with baths and gardens in front and allotments behind. As for "the space for expansion," the original 56 acres (of which 24 were reserved for the works and 32 for the village) were latterly extended to 547 acres, 287 allotted to works and 260 to the village, including its extensions.

The firm's expansion overseas has become world-wide, for in 1925 it was recorded in *Progress*, one of the company's magazines, that over 250 companies in all quarters of the globe were associated with Lever Brothers. Through Bromborough Pool and the Mersey, Lord Leverhulme had from Port Sunlight secured access by water to London and to British ports generally for home trade, and to the waterways of the world for his exports, as well as to the sources of the raw materials for soap manufacture. These facilities, owing to his foresight and enterprise, are about to be greatly increased by the opening of the Bromborough dock under construction on the Mersey side, from and to which ocean steamers will take and bring cargo.

Mr. Lever and his brother, before they moved to Port Sunlight, had determined that their employees should share in their prosperity. The prosperity sharing pledge was primarily redeemed in the creation of Port Sunlight village with its abundant amenities, and in the spaciousness of the factory area and the buildings erected thereon with all the arrangements now comprehended in the term "factory workers' welfare." Those who lived in the village further enjoyed "prosperity-sharing rents," based on the cost of maintenance repairs and renewals, the interest on the capital expended being a charge on the company's profits. The same principle was applied to works welfare expenses, beginning with a pensions scheme called the Employers' Benefit Fund, long service awards, cottage hospital, holiday club, but including in later days the co-partnership scheme and the many benefits flowing from it, *e.g.*, free insurance policies, unemployment and sickness benefits, staff college training and scholarships. The effect of the prosperity-sharing environment on the workers was a frequent subject of inquiry on the part of visitors; to Mr. and Mrs. Lever it was a source of pride, cultivating as they did the affection of the children an missing no opportunity of promoting their health and happine and entertainment, or of meeting them in their Sunday schoo and day school festivals.

In 1906 (12 years after the incorporation of the private co pany of Lever Brothers Limited into a public company) an attac was directed by a powerful Press organisation against an arrang ment made by Mr. Lever with some other soap makers, whic was mistakenly denounced as a soap trust. It was shown, how ever, in the course of the legal action taken by Mr. Lever again his principal assailant, that on the contrary, the object of th plan was to render better service to the public as well as to th distributors, both wholesale and retail. On the third day Mr. Lever's ordeal in the witness box the counsel for the defen withdrew the plea of justification, as well as every imputatio made upon Mr. Levers' honour and integrity, and apologis for having made the attack upon him. Mr. Lever presented th University of Liverpool with the amount of the damages a costs awarded to him, together with an additional sum whi brought the endowment up to £100,000.

Mr. Lever was in politics an advanced Liberal and, in aid his party against strong Conservatives, allowed himself to nominated a Parliamentary candidate six times in all, thrice f Birkenhead, twice for Wirral and once for the Ormskirk Divisi of Lancashire. He scored a notable victory on his second can dature for Wirral in 1906, and introduced bills on old age pe sions and payment of members, which were afterwards taken by the Government and became law. After being raised to t peerage he made a favourable impression in the House of Lor by his speeches on labour questions, and on decimal coinage introduced a bill which was remitted, with another, to a sele committee, which, however, did not complete its sittings with the life of that Parliament.

In 1909 Mr. Lever launched his great scheme of co-partn ship with employees. "A remarkable year" he characteris this, for it happened to be the centenary of his father's bir the 21st anniversary of the foundation of Port Sunlight, a the year in which his son was coming of age and entering t business. The scheme, avoiding the objections to ordina profit-sharing arrangements, was contrived to give to manag and other employees a common interest with the employer avoiding loss as well as in sharing gain, the motto of all bei "Waste not, want not." A reduced *facsimile* of the partners certificate is bound together with a number of Lord Lev hulme's addresses explaining his scheme, in "The Six-H Day" referred to below.

The years 1910–4 brought to the founder of Port Sunli fresh honours but also severe personal sorrows. In 1910 brother died. In 1911 he was made a baronet; in 1913 he recei from the King of the Belgians the Cross of Grand Officer of Order of Leopold II. On July 24 of the same year he suffe his heaviest bereavement in the loss of Lady Lever, who been his companion on many voyages, had visited with him concessions on the Congo, and, on her return, had been mad Fellow of the Royal Geographical Society. Her memory honoured, when on the visit of King George V. and Queen M in 1914 His Majesty laid the foundation stone of the Lady Le Memorial Art Gallery. The completion of this building impossible until the close of the World War, but then becam lordly treasure house, built, furnished, endowed and dedica to Lady Lever's memory by her husband, the Princess Beat opening it in 1922.

Sir William's war activities included the loan of sev buildings as hospitals, and service on many committees, incl ing the Liquor Control Board and the Army and Navy Cant Board. He was also gazetted Hon. Col. of the 2nd Vol. B the Cheshire Regt., in which, in its early days, as a volunt training corps, he had drilled as a private.

After his baronetcy, many other public honours were stowed on him. He was raised to the peerage in 1917 as B Leverhulme (a name chosen by himself as combining that o late wife with his own) and the designation "of Bolton oors" as indicating his unceasing affection for his native wn. He was high sheriff of Lancashire in 1917 and mayor of olton in 1918–9. The University of Edinburgh conferred upon m the hon. degree of LL.D. He was also made hon. fellow of e Royal Institute of British Architects.

In 1918 Lord Leverhulme turned his attention to the subject reconstruction after the War and advocated the running of achinery in factories in double shifts of six hours in order to sorb the unemployed and to increase production at a lower st. Under the title of *The Six-Hour Day and Other Industrial estions* a selection of Lord Leverhulme's speeches and writ- gs on co-partnership, education and business was edited by r. Stanley Unwin, and published with an introduction by scount Haldane. The editor, in his preface, remarked that Lord Leverhulme prescribes a six-hour day, but manages to rk sixteen." He might have added that further time was ved for business transactions by his habit of travelling to and m London by night trains. When at home in London he e at 4:30 A.M. to read reports and prepare for the day's inter- ws and correspondence. It was in 1918 also that Lord Lever- lme bought from Col. Duncan Matheson the Island of Lewis, quiring later North and South Harris also. He spent large ms in a sincere effort to extend and develop the fishing in- stry and to help the islanders in other ways, but lack of sup- rt, especially on the part of the Scottish Office, led to the andonment of his schemes as far as Lewis was concerned; d he gave the town of Stornoway, including Lewis Castle d its grounds, to the people of Stornoway. He continued his velopments in Harris, where more local appreciation was own, until his death.

One of Lord Leverhulme's personal enterprises for the eco- mic development of his Hebridean properties was the open- or acquisition in 1919 of the retail fish shops, since familiar the public as "Mac Fisheries," to serve as an outlet for the ing industry of Lewis and Harris, the catches being conveyed swift steamers to Fleetwood and then distributed to over 300 ps in England, of which 110 were in London. Lord Lever- lme, having borne the whole of the expenses of the formation l development of Mac Fisheries, handed the business over to ver Brothers a year or two later with its capital intact.

mong Lord Leverhulme's many benefactions, the presenta- n to the nation of Stafford House, renamed in compliment to Lancaster House, and now constituting a home for the ndon Museum, is conspicuous. He was a generous benefactor the Congregationalist denomination, of which he was a mem- ; and jointly with his brother he erected the Blackburn Road urch, Bolton, as a memorial to his parents. He also built rist Church, Port Sunlight, St. George's Church, Thornton ugh, and Neston Congregational Church. He was a renowned lector of antique furniture, pictures and Chinese porcelain, l presented the larger part of his wonderful collection to the ly Lever Art Gallery at Port Sunlight. In Freemasonry he ched the high rank of Grand Junior Warden of England.

n 1922 Lord Leverhulme was made a viscount. Awarded Messel memorial medal in 1924, it fell to him to deliver the ssel memorial lecture to the Society of Chemical Industry itled "Science, Religion and Workshop," a typical example his happy gift of relieving solid and serious argument with f intervals of humorous anecdote.

t the 15th distribution of partnership certificates to his loyees, on his 72nd birthday, Lord Leverhulme protested inst a suggestion that he was without hobbies "other than unselfish and noble hobby of devising schemes for the bene- nd interest of his workpeople." He said he had a great many bies, adding, "I think road-making is my greatest hobby, then I have the building of towns. Port Sunlight was my . I am now engaged on my 11th—Moor Park in Middlesex. re are five or six in the Congo and others in various places." ord Leverhulme began his seventh journey round the world Nov. 14 1923 and completed it on March 24 1924. His last ney was to West Africa, returning to London on the morn- of March 15 1925. He resumed his business activities with his usual unsparing disregard of self, and caught a chill, which suddenly ended his remarkable career, on May 7 1925.

The testimony of Lord Leverhulme's fellow directors, embodied in a resolution drawn up on the morning of his death, summed up his life and work as "distinguished by genius, courage, imagination and devotion to duty, a career inspired by the highest ideals of public spirit and service to his fellow men, and notably by his interest in the welfare, education, better housing and amelioration of the conditions of labour of every rank of industrial worker, as evinced by his creation of co-partnership, life insurance, old age pensions, educational and other schemes for the benefit of his employees and by his gifts to the communities of Port Sunlight and Merseyside, to his native town of Bolton and to the nation." The directors further testified to "his natural simplicity, the charm of his character, the wealth of his affection and the loyalty of his friendship." (A. P.)

LEVI, SYLVAIN (1863–), French orientalist, was born in Paris March 28 1863. Educated at the University of Paris, in 1886 he was appointed a lecturer at the school of higher studies in Paris. As special lecturer in Sanskrit he taught at the faculty of letters from 1889 to 1894 when he was appointed to a professorship at the Collège de France. In 1897 and 1898 he made important tours of scientific research in India and Japan, and from 1921 to 1923 he travelled in India, Indo-China, Japan, Korea, Siberia and Russia. Prof. Levi became a director at the school of higher studies and a member of numerous societies, including the Royal Asiatic Society, the Linguistic Society and the Society of Jewish Studies. In 1923 he was made an officer of the Legion of Honour. His works include *Le théâtre indien* (1890, Prix du Budget, Académie des Inscriptions et Belles-Lettres); *La doctrine du sacrifice dans les Brahmanas* (1898); *Le Népal* (1905–8).

LEVY, AUGUSTE MICHEL (1844–1911), French geologist (*see* 16.519), died Sept. 21 1911.

LEWIS, ISAAC NEWTON (1858–), American soldier and inventor, was born at New Salem, Pa., Oct. 12 1858. On graduating from the U.S. Military Academy in 1884 he was given a commission in the artillery. From 1894 to 1898 he was a member of the board on the regulation of coast artillery fire in New York harbour. In 1898 he became recorder of the Board of Ordnance and Fortification in Washington, and the same year made a study of ordnance in Europe which led to the re-armament of the U.S. field artillery. He is the inventor of a number of range finding and other mechanical and electrical instruments used for artillery fire control purposes in U.S. coast defences. From 1904 to 1911 he was instructor and director of the coast artillery school at Fort Monroe, becoming lieutenant-colonel in 1911. In 1913 he retired from active service with rank of colonel. The same year a machine-gun of his invention (the Lewis gun) was accepted by the British, French and Belgian Govts. after it had been rejected in America. Throughout the World War it was extensively used by all the Allies. Col. Lewis refused to accept the royalties, amounting to $1,276,000, on his guns made for the American Govt. after the United States entered the World War.

LEWIS, SINCLAIR (1885–), American author, was born at Sauk Centre, Minn., Feb. 7 1885. He graduated from Yale University in 1907, and was engaged for a time in newspaper work, being reporter on various papers. He acted in an editorial capacity for the Frederick A. Stokes Co., the Publishers' Newspaper Syndicate, and George H. Doran Co., at the same time writing short stories and novels. Among his works are: *Our Mr. Wrenn* (1914); *The Trail of the Hawk* (1915); *and Free Air* (1919). His early work owed much to the influence of H. G. Wells. By *Main Street* (1920), a study of a small town, he won wide recognition while he provoked much criticism. *Babbitt* (1922) was one of the most discussed novels of the century, and added a new word to the English language. It was followed by the scarcely less popular *Arrowsmith* (1924).

LEYGUES, GEORGES (1858–), French politician, was born at Villeneuve-sur-Lot on Nov. 28 1858, and educated in his native town, Toulouse and Bordeaux. On arriving in Paris he took up the study of the law, but his natural bent inclined him at the same time towards letters and he was well received in the Parnassian group of poets. After pursuing wide travels, ranging from the polar regions to the Levant, he entered politics. At the age of 26 he was elected deputy for the Lot et Garonne department. In 1894 and 1895 he was given Ministerial posts, respectively in the Dupuy and Ribot Cabinets. In June 1898 he was elected vice-president of the Chamber, but he resumed ministerial office in the 3rd Dupuy Cabinet of the same year. In Waldeck-Rousseau's Cabinet (1899–1902) known as that of "defence and republican action," he held the portfolio of public instruction, while M. Sarrien appointed him Minister for the Colonies in 1906. In the Clemenceau Cabinet of 1917 he was Minister of Marine. In 1920, when M. Millerand became President, M. Leygues was asked to form a Government. He remained until 1921 Prime Minister and Minister for Foreign Affairs. He was again Minister of Marine in the cabinets formed by M. Briand in Nov. 1925 and March 1926. His publications include *Le Coffret Brisé* (1882); *L'École et la vie* (1904); *La Pologne* (1918); *Colbert et son oeuvre* (1920).

LIANG SHIH-YI (1869–), Chinese politician, was born in Kwangtung, and, unlike many other Chinese republican leaders of his time, was educated wholly in China and knew no other language than his own. Graduating with honours in classics, he was appointed secretary to Tang Shao-yi when that statesman led a mission to India in 1906, and then began a successful career in the civil service. He was appointed director of railways and assistant director of the Chiao T'ung Bank in 1907, acting director of Imperial Chinese Posts in 1911, acting minister of communications in 1912, acting vice-minister of finance in 1913, and a member of the council of state and director-general of customs and taxes in 1915. The failure of Yuan Shih-kai's monarchical *coup d'état*, of which he was one of the supporters, compelled him to resign, but in 1918 he returned to favour as Speaker of the Senate. Throwing in his lot with Chang Tso-lin in the contest between the latter and Wu Pei-fu, he became Prime Minister in 1921. The defeat of Chang, however, resulted in his fall, and he left Peking in 1922 to escape Wu's vengeance and took no further part in politics. He visited Europe in 1924.

LIAPUNOV, ALEXANDER MIKHAILOVICH (1857–1918), Russian mathematician, was born April 25 (old style) 1857, a son of the astronomy professor in the University of Kazan, and the brother of the musician and composer Sergei M. Liapunov. In 1901 he was made a member of the Russian academy of science and later was appointed professor at Kharkov University. He died Oct. 31 1918 in Odessa. His mathematical research belongs mainly to hydrodynamics and his chief work is *Sur les figures d'équilibre peu différentes des ellipsoïdes d'une masse liquide homogène douée d'un mouvement de rotation* (1909–12). His voluminous investigations are very specialised and not available to the ordinary reader, but they are of incomparable value to specialists. They are published in French and in the *Memoirs* of the Russian Academy of Sciences (1895, etc.) and his first treatises, which appeared in Russian, are translated into French and published in the *Annales de Toulouse*.

LIBERAL PARTY (*see* 16.538).—When the House of Lords rejected the budget at the end of 1909, Mr. Asquith immediately dissolved Parliament and appealed to the electors. The appeal was not only for the passing of the budget, but also for the permanent removal of any control over finance by the Upper Chamber, and for a time limit on any veto on any other legislation passed by the House of Commons. In the election, the Liberal party lost a considerable section of its enormous majority. But Mr. Asquith had, in combination with the Irish and the Labour members, a majority of 124 pledged to these two operations.

The Parliament Act.—The budget was passed in April, but in May 1910 King Edward VII. died and a kind of truce of God was called on the important constitutional question between Lords and Commons. Delegates from both sides discussed all possible forms of double chamber government for the remaining nine months of the year. Agreement was finally found to be impossible. The conference broke up and immediately Mr. Asquith again dissolved Parliament, this time with the written guarantee of the new King, George V., that if the country again
endorsed his policy the royal prerogative would be exercised
create a sufficient number of peers to cause the necessary b
to become law. The election resulted in almost exactly the sam
balance of numbers as that which was held nearly 12 montl
before. Mr. Asquith's Veto bill passed through all its stages
the House of Commons by majorities of over 100, and the amen
ments which the Lords endeavoured to make to it were rejecte
The Conservatives were informed they must either allow the b
to pass or its passage would be effected by the creation of se
eral hundred new peers. They chose the former course.

The Liberal Programme.—The Liberal Govt. then proceede
to endeavour to carry measures, the principles of which t
House of Lords had previously rejected and the House of Co
mons previously approved—Home Rule for Ireland, Wels
Disestablishment, and the creation of a more democratic fra
chise by giving each man only one vote. Of these the last w
withdrawn owing to its complication over the question of givi
the votes to women. Home Rule passed after many months
most bitter controversy and the organisation of continge
rebellion both in Ireland and in England. But it was only p
on the statute book after the opening of the World War in 191
accompanied by a condition suspending its operation till th
War was over. The Welsh Disestablishment bill was also pass
and came into operation after the War was over. Mr. Llo
George also passed his great contributory insurance schem
and in 1913 he launched an ambitious land policy in town a
country, which was accepted by the Liberal party and on whi
they intended to appeal to the country.

The War Period.—But all such plans were swept away by t
outbreak of the World War in Aug. 1914. The Liberal Cabin
was seriously divided between the policy of neutrality and t
policy of intervention, and at one time the resignation of t
Govt. appeared inevitable. The War was conducted exclusiv
by the Liberal Cabinet until May 1915, when failures in t
field, the anxiety of the people and the bitter attacks by t
newspapers, made it essential that a *union sacrée* should
formed in Britain as it had been formed in other countri
There was therefore constructed the first Coalition, in whi
Mr. Asquith remained Prime Minister and the most importa
offices—the Foreign Office, the Chancellorship of the Excheq
the Ministry of Munitions—were still held by Liberals; but
which all the Conservative leaders and some representatives
Labour were included.

This Govt. continued to direct the operations of war until t
late autumn of 1916. Owing to that War's prolonged cont
uance, with many disastrous defeats, the renewed attacks of
popular newspapers, and the gigantic loss of life and treasu
the public mind was prepared for a further change. An intri
of a few men, ostensibly directed toward giving Mr. Ll
George control of the War operations but in fact designed
exclude Mr. Asquith and the Liberals from the Cabinet, pro
unexpectedly successful. Mr. Asquith resigned with all
Liberal colleagues. Mr. Lloyd George constructed a Cabi
composed of Conservatives, some minor Liberal memb
Labour members and business men.

Mr. Lloyd George as Premier.—For the next two years Mr.
quith and his followers, being a substantial majority of
Liberal members in the House of Commons, confined th
selves to suggestions and criticism. But their support for
inquiry into the allegations made by Sir Frederick Maurice
the conditions which led to the greatest defeat the British Ar
has ever experienced on March 21 1918, created a break betw
the two sections of the party. In the following autumn, w
Germany was utterly vanquished, Mr. Lloyd George iss
what was called a coupon, contained in a letter signed by h
self and Mr. Bonar Law, which was published as a recommen
tion to voters in all constituencies to vote against Liberal me
bers and candidates who still declared allegiance to Mr. Asqui

The Election of 1918.—The result was a débâcle. Mr. Asqu
and all the Liberal ex-ministers who were faithful to h
were defeated and only some 30 such Liberals were return
These, under the leadership of Sir Donald Maclean, who h

ver held Cabinet office, maintained some sort of opposition inst the overwhelming forces of Mr. Lloyd George's Coalition. soon became apparent, however, that the great mass of the erals in the country were bitterly opposed to this Liberal-ry combination. Mr. Asquith was returned for Paisley at a -election and assumed the leadership of what was scornfully med the Wee Frees. In a fierce political civil war, carried on three years, it was obvious that Mr. Lloyd George's nominees ld only be elected by Conservative votes and that the Lib-ls were either in large numbers joining Labour or remaining ggedly determined to destroy the Coalition.

n 1922 Mr. Lloyd George and his Coalition were overthrown an intrigue, very similar to, and in part conducted by the ne men, the one which had placed him in power. A con-vative Govt. was formed and in the appeal to the country eral was still found fighting Liberal, the result being the struction of a considerable section of Mr. Lloyd George's lowers, thus leaving the two Liberal sections still in a negligi- minority in the House of Commons.

Liberal Reunion.—The year after, however, Mr. Baldwin, o had succeeded Mr. Bonar Law as Prime Minister, unex-ctedly appealed to the country for a general tariff as a means relieving unemployment. The Liberal leaders came together so vital a question; Mr. Lloyd George accepted Mr. Asquith leader of the party, and the two ex-Prime Ministers issued a nt appeal. The distrust of the Coalition by the Liberals in country, however, had caused so many to turn to Labour t, although those who had been followers of Mr. Asquith ned a large number of seats, the number of those who had en concerned with the Conservatives and the "coupon," re still further diminished. Although they had secured sub-ntially the same number of votes, the Liberals found them-ves in members 30 behind the Labour party, and with no party a majority, Mr. Asquith announced the intention of the erals to support a Labour Government. For nearly a year t Labour Govt. was retained in office by the votes of Liberal mbers, although it refused any agreements or consultation ncerning policy and set up candidates in almost every con-tuency against the Liberals who were supporting it in the use.

The Election of 1924.—Such an impossible position was ter-nated in unexpected and almost casual fashion. The Labour ime Minister decided to dissolve Parliament in preference to cepting any form of inquiry concerning the vague insinuations ociated with the initiation and then withdrawal of a prose-tion against a communist newspaper and its temporary editor, . Campbell. In the dissolution which followed, while Labour ceived a severe setback, the Liberal party in Parliament was most annihilated although polling more than 3,000,000 votes d the largest Conservative majority was returned since the eat Reform bill. Mr. Asquith, who was defeated, retired to House of Lords as Lord Oxford, but remained leader of the eral party. Mr. Lloyd George was elected chairman of the eral "rump" of 40 that remained in the House of Commons, whom some 10 formed themselves into a Radical group and used to accept his leadership. The remaining 30 were mostly cted by Conservative votes and some were pledged, in critical isions, never to vote against the Conservative Government.

This desperate condition in Parliament was, however, not lected by the Liberals in the country who over large areas oceeded to initiate Liberal campaigns, to collect substantial ds, and to prepare for a reversal of the decision when the t general election should come. The Liberal party also set lf down to consider vital social programmes; to issue pro-uncements on such subjects as coal and power, the land and nation and towns and the land. A small group in the House Commons maintained a lively opposition to Mr. Winston urchill's Budget of 1925 and to any tampering with free de in the Safeguarding of Industries bill.

The revolutionary conclusions of Mr. Lloyd George's Land mmittee, in part watered down by a compromise with the eral candidates association, were accepted by the delegates in a great Liberal convention representing the whole of the country, as an essential part of Liberal policy. This formed a cause or an excuse for flight from the party of certain ex-ministers and persons of wealth. In 1926, however, Lord Oxford remained undisputed leader of the party as a whole, and Mr. Lloyd George chairman of a rather forlorn and divided group in the House of Commons, while great energy was being shown by a land and nation league to spread the new reform doctrines especially in rural England, and vigorous attempts were made to reverse the verdict of the last election and place some 500 Liberal candidates in the field before the next appeal to the electors. (*See* English History.) (C. F. G. M.)

Early in May this co-operation was interrupted by a serious difference between Lord Oxford and Mr. Lloyd George over the general strike which broke out on May 3. Lord Oxford held with the Government that the general strike, being a threat to the constitution, must be defeated before any negotiations for peace were considered. Mr. Lloyd George attributed the strike to precipitate action by the Cabinet which he condemned and supported the plea of the Archbishop of Canterbury for a negotiated peace. On May 10 Mr. Lloyd George declined in writing to attend a meeting of the shadow Cabinet summoned by Lord Oxford who, in communications of some severity, interpreted this abstention as tantamount to resignation. Mr. Lloyd George refused to resign and at meetings of the Liberals who had seats in the House of Commons was supported in that attitude by 20 votes to 10. The situation was complicated by Mr. Lloyd George's contributions to the Press in the United States and by his alleged but strongly denied negotiations with Mr. Philip Snowden, representing moderate Labour. Also, Lord Gladstone accused Mr. Lloyd George of withholding the funds with which he was entrusted at the late general election. (Ed. *E.B.*)

LIBERIA (*see* 16.539).—By an agreement reached in 1910 France obtained some 2,000 sq. m. of hinterland which Liberia had claimed but had not administered. This reduced the area of the republic to about 40,000 square miles. Estimates made up in 1925 put the Americo-Liberians at about 20,000, of whom approximately half live in Monrovia, the capital. The native population is believed to be decreasing, it numbers probably 1,000,000 to 1,250,000. Some thousands of negroes in the coast region have adopted the religion (Protestant forms of Christianity) and the standards and language (English) of the Americo-Liberians, whose authority has become generally recognised over the whole country. Primitive conditions prevail throughout the interior.

History.—The condition of Liberia in 1910–11 was far from satisfactory. It was burdened with debt, it had granted many concessions without being able to control the regions in which the concessionaires were to work, and its authority rarely extended more than 20 m. from the coast. The frontier regions, which adjoined French or British colonies, were in a disturbed condition; the French especially were troubled by the remnants of Samory's army (*see* 24.642) and other malcontents who took refuge in the Liberian forests and raided across the frontier; hence the annexation by France of part of the border region. It appeared as if the experiment of "running" the country by American negroes—as alien to the bulk of the natives as are white men—on the lines of the constitution of the United States would collapse. However the intervention of the United States Govt. led to a financial re-organisation which gave the Americo-Liberians a new start. There was some trouble with Germany in settling the matter. The German Govt. energetically pressed its claims, the gunboat "Panther" being anchored for a month off Monrovia, with its guns trained on the executive mansion. All difficulties were overcome however by June 1912, when an international loan of $1,700,000 (£340,000) was raised, the bonds to be issued for not fewer than 40 years. The customs duties and certain taxes were pledged as security for the loan, and are administered by an American receiver-general, who is also Financial Advisor to the Liberian Government. Thus in effect the control of finances is in the hands of the United States and expenditure is kept within the limits of the revenue. A frontier police force was also organised by officers of the United States Army, and as a result Liberian authority was better maintained.

During the World War the Germans, deprived by force of arms of their own colonies, found in Liberia their last foothold in West Africa. But in Aug. 1917 Liberia declared herself in a state of war and expelled the Germans. She was a signatory of the Treaty of Versailles, her representative at the peace conference in Paris being Mr. C. D. B. King. Mr. King was in 1920 chosen as president of Liberia and in 1924 was re-elected for a second term. He strove, with some success, to improve conditions in Liberia and was the originator of a system of road building which gave a prospect of opening up the interior.

Economic Conditions.—The natural resources of Liberia are almost untouched; the only cultivated crop of importance for external trade is coffee and the other industries for export are practically confined to the products of the oil-palm and piassava fibre (prepared from the raphae palm). While Monrovia has two wireless stations and direct cable communication with Europe and New York, there are no harbours and no railways and until means of transport are developed the wealth of the forests and the mineral resources cannot be utilised. The Government, however, has no money to spend on reproductive works. In 1925 an American firm obtained a concession of 1,000,000 ac. primarily for the establishment of rubber plantations. Meanwhile the bulk of the trade was in the hands of British and German firms, the Dutch being next in importance. The United States took but an insignificant fraction of the trade. Between 1913 and 1923 the volume of trade about doubled. In the last named year imports were valued at £298,000 and exports at £242,000. Revenue in 1912–3 was $618,800, accounts being kept in American currency, though the money in circulation is British. In 1923–4 revenue was $380,000, expenditure $371,600.

LIBERTY LOANS, the name given to the four loans floated by the U.S. Govt. during the World War. A fifth loan, floated after the Armistice, was called officially the Victory Liberty Loan, but is here considered as the Fifth Liberty Loan. Between May 14 1917, when the First Liberty Loan was offered to the public, and May 10 1919, when the campaign for the Fifth Loan was brought to a close, the people of the United States subscribed $24,072,111,400. Of this amount, $21,432,924,700 was finally accepted by the Secretary of the Treasury. The Fourth Liberty Loan, concluded Oct. 18 1918, was, however, larger than any single loan issued by any of the other belligerents, and realised a total of nearly seven thousand million dollars. The number of subscribers to this loan was more than 21,000,000, or one-fifth of the total population of the United States. Moreover, the U.S. Govt. was able to dispose of the Liberty Bonds on very favourable terms; they were issued at par, the rate of interest varying from 3½% on the First Loan to 4¾% on the Fifth. There were a number of reasons for the favourable terms obtained. The United States was immensely wealthy and had just passed through a period of great prosperity; its record for quick payment was unique; patriotic spirit was at a high pitch; advertising on an unexampled scale was undertaken; and the rate offered, while lower than those of European countries, was high as compared with the 3% and 2% paid in recent years on U.S. Govt. bonds.

When America entered the World War the Govt. realised that, in addition to the money needed to prosecute the War by the United States itself, large sums must be raised to relieve the already overstrained credit of the European Allies. The total amount of these loans to foreign countries was $9,842,468,566, to which was added later from sales of war material, etc., $736,040,776, making a total of $10,578,509,342. This money, excluding that derived from sales of war material, etc., was part of the amounts raised in the Liberty Loans. The financial policy of the Govt. was to raise from one-fourth to one-third of the necessary funds from taxation, the rema
der from loans. The Treasury Dept. throughout the War met c
rent obligations by issuing short-term Certificates of Indebtedne
which were absorbed by the Federal Reserve Banks and to so
extent by outside banks and private persons. These certificates w
retired either by exchange for Liberty Bonds or by redemption fr
money obtained through the sale of such bonds. The Liberty Loa
constituted therefore a series of funding operations. These ope
tions were intended not only to extend the debt over a period
years, but to distribute it as widely as possible. The success of t
policy is indicated by the facts that 53% of the individual subscr
tions for the Fourth Loan were for $50 bonds, and that approximate
25,000,000 persons were, at the end of the War, holders of Libe
Bonds. Before the United States entered the War such a res
would have been thought impossible, for it was then estimated th
there were only about 350,000 bond investors in the United Stat

Under the Act of April 24 1917 the Secretary of the Treasu
was authorised to issue bonds to the extent of $5,000,000,000
a rate not to exceed 3½%, these bonds to be convertible in
bonds of a higher rate if such should be issued before the end
the War. The Secretary of the Treasury made the first iss
$2,000,000,000 and proceeded to create a War Loan Organisati
in the Treasury Department. The 12 Federal Reserve Ban
were used as the central agencies in the 12 Federal Reser
Districts, and each of these banks formed Liberty Loan Co
mittees. To each district a "quota" or proportional part
the whole issue was allotted. The value of advertising in arou
ing the public had been clearly demonstrated in the campaig
for the British War Loans, and the Treasury Dept. made use
every available means of publicity. As a result the First Lo
was oversubscribed by more than $1,000;000,000.

In subsequent campaigns the methods employed in placi
the First Loan were developed and extended. In each city
organisation known as Four-Minute Men was formed; the
men visited places of public resort, including the play- a
motion-picture houses, and spoke for four minutes on behalf
the loans. The Govt. assisted local authorities in organisi
street parades in which men from the training camps parti
pated; captured German war material was displayed; disti
guished soldiers and other visitors from Great Britain, Fran
and the other Allied nations were given elaborate receptio
These campaigns were of great value as a means not only
selling the war bonds but of keeping up the morale of the peop

The following are the figures of the number of persons su
scribing to each of the five Liberty Loans, the total of the amou
asked for, the subscriptions and the final allotments:—

Loan	Subscribers	Amount asked	Subscriptions	Allotments
		$	$	$
First (1917)	4,000,000	2,000,000,000	3,035,226,850	1,989,455,5
Second (1917)	9,400,000	3,000,000,000	4,617,532,300	3,807,865,0
Third (1918)	18,308,325	3,000,000,000	4,176,516,850	4,175,650,0
Fourth (1918)	22,777,680	6,000,000,000	6,992,927,100	6,964,581,1
Fifth (Victory, 1919)	11,803,895	4,500,000,000	5,249,908,300	4,495,373,0

(F. H. H.)

LIBRARIES (*see* 16.545).—This article is concerned with t
main developments of the public library service and with certa
special aspects of library work since 1910.

I. GREAT BRITAIN AND IRELAND

Great as was the advance achieved during the last quart
of the 19th century, and especially under the influence of Andr
Carnegie during the years 1900–10, a still greater advance to
place after 1910, and especially from 1918 onwards. Up to t
latter date the service had suffered in two main respects, name
the 1d. rate limit which, except in the great cities, prevent
anything like adequate expenditure on books and salaries, a
the practical inapplicability of the Libraries Act in the small
centres of population. These difficulties had been set forth wi
vigour and persistence by the Library Association, and in 19
the position was restated by Professor W. G. S. Adams in a rep

ublished by the Carnegie United Kingdom Trust, which showed hat the great majority of public libraries were utterly unable o provide an adequate service on the 1d. rate, and that the only ope for rural areas and the smaller towns lay in the establishment of a co-operative system.

Acting on this report the Carnegie trustees set up a number f circulating systems on a regional basis.[1] The county was the nost hopeful unit, and during the years 1915–8 a number of ounty councils, through their education committees, and with he aid of substantial trust grants, set up experimental schemes nder which, from a central store, collections were sent out on eriodic loan to villages where they were as a rule housed in the chools and administered by the schoolmaster. The earliest chemes were those of Staffordshire, Cardiganshire, Carnarvonhire, Perthshire. As the county authority then had no power levy a library rate, the whole cost was borne by the Trust.

Legislation.—The success of the experiment was immediate nd convincing. In the Education (Scotland) Act 1918 it was rovided (clause 5) that the county education authority should ave powers to levy a library rate. In England and Wales the rinciple was recognised by the Public Libraries Amendment ct of 1919 by which county councils were empowered to levy rate, entrusting the administrative arrangements to their eduation committees. The same powers were set up in Northern reland by the Public Libraries Act of 1924, and in the Irish ree State by the Local Government Act of 1925.

After the passing of these Acts the system spread with great apidity under the encouragement of the Carnegie trustees (who xpended altogether £310,300 during the period 1915–25), and y the end of 1925 the only administrative counties which had ot received trust grants were: in England, Westmoreland, ampshire (Isle of Wight)—both of which, however, had less mbitious schemes, not under the 1919 Act—Rutland, Lincolnhire (the Holland division) and Scilly; in Wales, Carmarthenhire; in Scotland, Argyll. In Ireland there were schemes in hree of the northern counties, and 14 of the southern counties.

The system began with the distribution of boxes of books to illages. Within 10 years in several counties the motor-van brary had displaced the box; co-operation with municipal braries had begun; sets of books were provided for all organised dult classes; special collections (*e.g.*, for teachers, agriculturalts, students of local history, etc.) had been made; in a few cases, the basis of differential rating, small libraries of the municipal ype were set up in semi-urban areas too large to be served on he purely circulating system.

The Act of 1919, besides establishing the county as a library nit, removed the rate-limit in England and Wales. In Scotland 1920 the limit was raised to three pence. In Ireland the same xtension was sanctioned in 1920, with a further extension to 6d. r county boroughs. The majority of municipal libraries took reater or less advantage of their new freedom, but there was uch leeway to make good, and up to 1926 insufficient provision r book purchase and salaries was still common. The American brary in 1926 was spending roughly four to five times as much er head as the average British library. Perhaps the most hopel sign was a tendency on the part of the weaker libraries to -operate with the new and vigorous county systems, or with her neighbouring boroughs.

The Central Library for Students.—Apart from the borough d the county service, the chief important development is the tablishment of a national lending library of serious books,—own as the Central Library for Students—as a reserve to the cal services which, under the most favourable conditions, must ways find a difficulty in meeting the needs of specialist readers. This library was started in 1917, largely to supply organised adult education classes, but in 1925 it also served 235 borough and 47 county libraries; with a stock of roughly 31,000 books, the issues from the three depots (London, Dunfermline, Dublin) totalled approximately 54,000. The library has been financed chiefly by the Carnegie Trust with substantial contributions from the Cassel Trust, the Thomas Wall Trust, and the United Service Fund and a comparatively small revenue from the voluntary subscriptions of borrowing libraries. Its sponsors have stated a case for a government subsidy, the library being capable of becoming in a real sense the keystone of the national lending service.

Co-operation with Special Libraries.—Thanks to grants from the Carnegie Trust, many special libraries agreed during 1922–5 to place their collections (rare and irreplaceable works excepted) at the disposal of the central library—a step of great importance towards a systematic inter-loan service. This policy of co-ordination was advanced a further stage in 1925 by the establishment of the Association of Special Libraries and Information Bureaux, and the initiation by the Association of University Teachers of a tentative system of exchange between university libraries.

The Carnegie Trustees prepared a fresh report, issued in 1924, which surveyed the situation during the period 1921–3. It showed that the smaller borough libraries were still financially embarrassed, and indicated the desirability of co-operation between them and the county service. Similar conclusions emerged in the report of the adult education committee appointed by the President of the Board of Education (1921–3). Accordingly, in 1924, the President of the Board set up a departmental public libraries committee, under the chairmanship of Sir Frederic Kenyon, Director of the British Museum, and representing both librarianship and education. This committee was expected to report towards the end of 1926 or the beginning of 1927.

Librarianship.—The pressing importance of raising the standard of education among public librarians received continuous attention from the Library Association and the Carnegie trustees. There was a strong feeling in the profession against the appointment of persons over 16 years of age, which automatically excluded university graduates; moreover, up to 1919 and even afterwards salaries were too low to induce university graduates in any numbers to enter the service. In that year, however, with the aid of a Carnegie Trust grant, a school of librarianship was set up in University College, London, and since that date the number of students taking librarianship as a post-graduate course has appreciably increased. Summer schools have been successfully established both by the school and by the Library Association, and a number of chief librarians have arranged special courses for their junior staffs. Library committees in the United Kingdom were still, however, very far behind those of the United States in their appreciation of the importance of a high standard of general education in the ranks of librarianship, matriculation being normally the maximum requirement, with the understanding that promotion would depend upon the taking of the certificates of the Library Association (*see* 16.560).

Building Developments and Equipment.—The progress of library building was seriously interrupted by the World War, comparatively few libraries having been erected since 1914. The Carnegie Trust in 1917 ceased to make grants and in 1925 decided to consider no further applications. Between 1914 and 1926, however, existing promises were honoured in 26 cases, the more important being those made to Barrow-in-Furness, Nottingham (two branches), Barking, Bethnal Green, Ipswich, York, Gateshead, Exeter. The total sum expended by the Trust on public library buildings in 1914–26 was £295,600. In every case the modern system known as "open access" was adopted, and stress was laid upon accommodation for children. Great improvements were effected in design, with the object of securing better lighting, more effective supervision and the greater convenience of public and staff. Card catalogue and subject-lists have almost entirely taken the place of printed catalogues. There was a steady tendency to make the library, as in the United States, a more vital and potent factor in communal life, by developing the practice of giving lecture courses illustrative of the use and resources of the stock, of supplying schools with loan collections, and by co-operating generally with education authorities, of admitting non-residents to the reference room and (on payment of a small subscription) to the use of the lending department, and of giving special facilities to teachers and students. Library policy has, in fact, become far more liberal than it was before the War. Of the greatest importance to business men and students has been the establishment in great city libraries, since 1919, of commercial and technical departments, notably those of Birmingham, Manchester, Liverpool and Glasgow. The machinery of distribution, through branches, with the aid of union catalogues, was greatly developed (*e.g.*, especially in Glasgow).

---

[1] The idea in itself was not a new one. The principle was already nbodied in voluntary schemes in Dorsetshire, in Yorkshire (under e auspices of the Yorkshire Village Library), and had been tried Scotland as early as the middle of the 17th century; in Indiana, S.A., as early as 1816. The trustees, however, for the first time Great Britain systematised the principle by the adoption of the unty authority as the administrative unit. Several attempts to t up rural services based upon a central borough library came to thing.

National Libraries.—Since 1910 two new national libraries have come into existence, the National Library of Wales, on a splendid site just outside Aberystwyth and the National Library of Scotland, formerly the Advocates' Library (*see* 16.557*c*), in Edinburgh. The former is a magnificent building begun in 1911, opened in 1915. It was not yet complete in 1926, but it already housed a splendid collection of books, manuscripts, historic papers, etc. It had the finest Welsh collection in existence and was strong in other Celtic languages. Its printed books numbered 450,000. It was erected by funds subscribed by the Welsh people themselves with a pound-for-pound government grant. The Faculty of Advocates presented their historic library to the nation in 1923, and it was duly vested in trustees by Act of Parliament in 1925, having received a generous endowment of £100,000 from Sir Alexander Grant. The Advocates retain the law section. The copyright privilege is enjoyed by both these libraries.

Between 1910–26 considerable development took place in the British Museum library. The accommodation for readers was increased by the addition of a reserve reading-room in the northern extension. There was also an extension of storage room, and a scheme for increasing the book-stack was initiated. The length of shelving grew to some 55 miles. Of the other copyright libraries, plans were prepared for increased accommodation in the Bodleian Library and the library of the University of Cambridge, but financial difficulties prevented progress. The same difficulty confronted the library of Trinity College, Dublin. As regards the last-named, the reluctance of Irish publishers, after the recognition of the Irish Free State, to send books to the copyright libraries in Great Britain seemed likely to imperil the copyright privilege; the right was, however, confirmed. The National Library of Ireland was closed for some time during the period of political unrest, but was subsequently reopened.

II. THE UNITED STATES

The County System.—As in Great Britain, the most distinctive development in the United States since 1910—though not so widespread as in Great Britain—has been the attempt to deal with the needs of rural areas. The county system began in Indiana in 1816; Wyoming legislated in 1886. Travelling libraries were established in New York, Wisconsin and Michigan between 1890 and 1900. Ohio and Maryland adopted the county system in 1898; Wisconsin and Oregon in 1901 and 1903. After 1910, however, the system was put upon an entirely new level of efficiency in California, where there were in 1925 no less than 42 county schemes holding jointly 2,500,000 books, with a total annual income of $1,250,000. The system was greatly strengthened by the existence of the fine state library in Sacramento, which acts as a kind of clearing-house (with a union catalogue) and central reserve for the whole state.

In a single year (1924) county libraries borrowed no less than 37,000 volumes for special readers. It is remarkable that by 1926 some 60 independent town libraries had voluntarily merged themselves in their respective county systems, thus greatly adding to the service of books upon which their readers might draw, and reducing their expenditure. The local centres are as a rule upon a more elaborate scale than their British counterparts: they have small, but admirably arranged, reading-rooms, permanent collections, and paid librarians, the circulating syste being, except in the case of very remote centres, only suppl mentary. A different system obtains, *e.g.*, in the State of Massa chusetts and other eastern states, where the unit is the tow ship, and the whole machinery is based upon a central office the department of education. By 1926 the county systems ha been established by statute in 29 states, but schemes were operation in only 200 counties out of 2,964. There is, howeve no doubt that under the influence of the Carnegie Corporatio of New York, supported by the fine example of California, t scheme is likely to spread rapidly.[1]

Municipal Service.—There has also been great progress in t municipal library service which, though of the same gener type as its British counterpart, has shown itself considerab more elastic. Several magnificent libraries, including those Detroit, San Francisco and Cleveland, have recently bee erected.

Librarianship.—The profession of librarianship is better pai and more highly esteemed than in the United Kingdom. B tween 1887 and 1919 no less than 15 schools of librarianship we founded, the more important being the New York State libra school at Albany, the Pratt institute school at Brooklyn, t Carnegie library school at Pittsburgh and the Drexel institu school at Philadelphia.[2] The profession is largely in the han of women, though most of the senior posts in the large cities a still held by men. In 1921 nearly half the students in the librar schools were college graduates. The American Library Associ tion (membership nearly 7,000) is an active and efficient bod founded in 1876, with headquarters in Chicago. It represen both the United States and Canada. It issues select biblio raphies, a specimen catalogue, reading courses (etc.) and, wit the aid of subsidies from the Carnegie Corporation of New Yor has undertaken important inquiries into the training of libr rians, and the relation of the public library to adult educatio Some 60 committees were at work in 1925 upon important pro lems of various kinds. The association in 1924 established library school in Paris with the aid of funds from the Americ committee for devastated France.

In 1923 a calculation showed that, as regards places havi not less than 1,000 inhabitants, 53·5% of the population ha access to public library facilities,[3] of which more than half owe their buildings mainly to Andrew Carnegie. In the more activ city systems, *e.g.*, at Cleveland (which in 1925 opened a magni cent new building on the most modern lines at a cost of ove $4,000,000 and which spends at the rate of rather more tha $1·25 per head), in New York City, at Detroit, Chicago, Pitt burgh, Boston, Newark, Indianapolis, Brooklyn, all kinds developments have been devised with the object of bringing t service into the closest contact with the life of the communit A great feature is made of commercial and technological colle tions; juvenile departments (usually under specially train assistants), service to schools, library clubs for adolescent service by telephone, teachers' libraries, music departments— all these illustrate the tendency to departmental specialisati which is making the public library a real factor in civic life. the new Cleveland library the arrangement of book stacks a reading rooms gives a concrete illustration of this importa development. The system of distribution through branches a sub-branches, in shops, factories and public buildings of ma kinds, is likewise designed to bring the communal stock direct to the service of the public. The public library has in fact b come the intelligence bureau of the community.

The Library of Congress.—The Library of Congress is t pinnacle of the whole structure. Unlike the British Museu this library, under reasonable safeguards, lends the rarer boo which state, municipal and county libraries do not posse There is, in fact, a recognised inter-loan system, working u wards from the village to the Federal library, under which a reader may as a rule obtain access to any publication whi sts in the country. In this scheme the universities and many ecialist libraries participate. Of the greatest importance in s connection is the national card-index system operated by Library of Congress, which supplies (at a very low price, d yet on a self-supporting basis) accession cards, fully regis-ed and annotated, to any library in the country. Several ousand libraries buy these cards, and thus tend gradually to ndardise their systems of cataloguing and classification.

---

[1] See H. C. Long, *County Library Service* (1925).

[3] W. S. Learned, *The American Public Library* (1924).

SPECIAL LIBRARIES

The chief development is the tendency, both in the United ngdom, and in the United States, towards systematic co-ordi-tion with a view to greater accessibility of special resources th on the inter-loan basis and for the benefit of the general blic. The American Association of Special Libraries was med in 1909, and has issued a directory. The formation of a rresponding British Association has already been recorded, d a similar directory was begun by this body in 1926.

In Great Britain, during 1910–26 there was a great develop-nt of scientific, technical and commercial libraries and bureaux information. The scientific and research associations, large mmercial and manufacturing firms, and the great industrial oups, awakened to the necessity of having well-organised -to-date collections for the use of their officials. The same vement has developed in America, probably to an even larger ent, though in that country the public library has, until ently, undertaken a larger proportion of this kind of service. great importance in this connection are compilations like the *orld List of Scientific Periodicals*, the *Subject Index of Periodi-s*, both started since 1915.

Mercantile Marine.—Reference may also be made to efforts behalf of sailors in the Mercantile Marine. The British ilors Society has attempted this service for more than a cen-y. Since 1920 it has revived and developed its arrangements der the stimulus of a Carnegie Trust subsidy. The Seafarers' lucation Service (founded 1920), also with the aid of a trust ant, and contributions from the owners and the men's unions, s succeeded in placing substantial libraries of a more advanced nd upon 150 ships. The Carnegie Corporation of New York has nilarly financed the American Merchant Marine Library Asso-tion. In Great Britain a system of supply to lighthouses and htships was initiated by the Carnegie Trust with the aid of public authorities concerned.

Libraries for the Blind, etc.—In Great Britain the needs of the nd have been met by the establishment of the National Library the Blind in London, founded in 1882. The present building s opened in 1916, and a large extension was begun in 1925, total cost being roughly £50,000. Books in Moon or Braille pe are lent freely to public libraries, and individual readers. sectional library for deaf education was set up in the library the University of Manchester in 1920. Hospital collections distributed under the auspices of the Red Cross Society. collection for the use of nurses and health visitors has been up by the College of Nursing (1921). The libraries of most the learned societies were financially embarrassed during and er the World War, but since about 1921 they have been doing eir utmost to make up arrears of book purchase, binding and aloguing. (J. M. M.)

LIBYA (*see* 16.578).—On the occupation of Tripolitania and renaica (Benghazi) by the Italians in 1911–2 Libya (Libia liana) was adopted as the common designation of the two onies. (*See* CYRENAICA; TRIFOLITANIA.)

LICHNOWSKY, KARL MAX, PRINCE (1860–), German lomatist, was born March 8 1860 at Kreuzenort in Upper esia. He entered the German Foreign Office in 1884 and from 4 to 1911 held secretarial posts in different German embassies road. In 1912 he was sent to London as ambassador, and re-ined at that post until the outbreak of the World War. He k part in the negotiations for a convention with Great Britain arding the Baghdad Railway and various colonial questions, ich was initialled on June 12 1914. Lichnowsky was con-ced that for years the relations between Germany and Great Britain had been mismanaged and misunderstood by the Foreign Office in Berlin, and, in particular, he believed that Bethmann Hollweg and his advisers failed to appreciate the pacific attitude and intentions of Sir Edward Grey and the British Govt. during the crisis that ended in the World War. He embodied his views in the pamphlet entitled *Meine Londoner Mission*, which he circulated privately in manuscript among his German friends. This document came into the hands of an opponent of the war, Capt. von Beerfelde, who was the means of its being published, without authorisation, in 1918. The publication exercised a very prejudicial effect upon the German war spirit and there were loud demands among the Conservatives and National Liberals for the prosecution of the author. The Prussian Upper House, of which Lichnowsky was a member, passed a resolution excluding him from that assembly. It became impossible for him to live in Germany, and he sought refuge in Switzerland.

LIEBERMANN, MAX (1847–), German painter, was born in Berlin July 20 1847. He studied from 1869–73 at the school of art in Weimar, from 1873–8 at the Paris Academy under Munkaczy, then for a short time in Barbizon with Millet, in Holland, and finally from 1878–84 at the Munich Academy. In 1898 he was appointed a professor at the university of Berlin. He became the chief exponent of the impressionist school of painting in Germany and the leader of the "secession." Liebermann won the Grand Prix at Paris in 1889 and received gold medals at Venice, Berlin, Vienna, Dresden, Munich and Antwerp. He became president of the Berlin Academy, a member of the Brussels, Dresden, Milan, Munich, Stockholm and Weimar academies and a corresponding member of the Institute of France. His chief pictures are "Jesus among the Scribes" (1879); "Jam Makers" (1879); "Women Plucking Geese" (1894); "Samson and Delilah" (1902); "The Board of Hamburg Professors" (1906); portraits of F. Maunann, Gerhart Hauptmann, Dehmel and Ed. Meyer.

See C. H. Rosenhagen, *Max Liebermann* (1900).

LIEBKNECHT, KARL (1871–1919), German politician, was born in Leipzig Aug. 13 1871. The son of Wilhelm Liebknecht (*see* 16.592), he qualified as a lawyer, and speedily became a prominent member of the extreme Left wing of the Socialist party. After serving a sentence of 18 months' imprisonment for high treason, in 1908 he was elected to the Prussian Chamber of Deputies, and in 1912 entered the Reichstag as a Social Democrat. Not long after the outbreak of the World War he was expelled from the Social Democratic party on account of his violent opposition to the policy of the Government and the successive votes of credit, and formed a faction of his own, *Die Sozialdemokratische Arbeitsgemeinschaft.* Arrested again in 1916 on a charge of high treason he was sentenced to four years' penal servitude; he was reprieved, however, on the eve of the revolution in Oct. 1918. He at once became the leader of the Spartacists, and was largely responsible for that party's insurrection in Jan. 1919. During the rioting he was arrested; and while being conveyed from military headquarters in the west end of Berlin to the prison at Moabit on Jan. 15, he was shot down by his escort while, as was subsequently alleged, he was attempting to escape. His associate, Rosa Luxemburg, perished the same night.

LIÉGE, Belgium (*see* 16.593), with a population in 1921 of 165,096, has been much improved in recent years, and has grown rapidly; it is a clean, prosperous and well-built city, and is the centre of the iron and armament manufacture of Belgium and of a coal-mining district. The production of zinc and of motor-cars has also become important. Of the 56 blast furnaces in the country in 1925 Liége had 20. There is also a large cattle market. Suburbs have arisen on the heights to the north, and a circular boulevard has been laid out with connecting roads. A number of houses near the university were destroyed by bombardment and by fires started after the German entry, and the bridges over the Meuse were blown up by the Belgians in their retreat; but the town as a whole, being an important centre, was spared by the Germans. The Place de l'Université has been renamed Place du 20 Août, in remembrance of the burning of houses and shooting of 18 persons as they escaped from the fires, by the Germans. The Place Verte is now Place du Maréchal Foch. Liége was the first large town captured during the War. The valiant defence of its powerful ring of forts delayed the German advance for a week and caused the enemy heavy losses. A number of the citizens were deported in 1916 during the German occupation. The city has since been granted the Cross of the Legion of Honour, and a representation of the Perron Liégeois, which symbolises the liberty of Liége, has been reproduced on a postage stamp. The forts were repaired by the Krupp company in 1914–5 (*see* BELGIUM, INVASION OF).

LIFTS: *see* ELEVATORS AND ESCALATORS.

LIGGETT, HUNTER (1857–), American soldier, was born at Reading, Pa., March 21 1857. He graduated from the U.S. Military Academy in 1879, and saw service in the west against the Indians. In the Spanish-American War in 1898 he served on the staff of the adjutant-general, and later was in the Philippines where, as major of volunteers he served for three years. In 1902 he was appointed a major in the regular army and spent several years with the Dept. of the Lakes and at Fort Leavenworth. In 1909 he attended the War College, and on graduating in 1910 was appointed a director there, and in 1913 president, becoming brigadier-general in the same year. From 1915 to 1917 he was again in the Philippines, being for one year commander of the Department. In 1917 he was made major-general and commander of the Western Dept., but in Sept. went to France as commander of the 41st Div. of the American Expeditionary Force. He was at the second battle of the Marne, at St. Mihiel and in the Argonne commanding the I. Army Corps and later the I. Army, and commanded the III. Army of Occupation on the Rhine. In 1919 he was commander of the Western Div., and in 1920 commander of the IX. Corps Area, retiring March 21 1921.

LIGHTING: *see* ILLUMINATION ENGINEERING.

LIGHTNING: *see* ATMOSPHERIC ELECTRICITY.

LIGHT RAILWAYS, MILITARY.—These are 60 cm. gauge railways laid with steel rails, weighing 20 lb. to the linear yard of rail, on sleepers weighing from 11 to 22½ lb. each, according to the weight of the rolling stock used, and laid 2 ft. 6 in. apart on a ballast track, the ballast consisting of sand, gravel, mine earth or burnt clay.

Rolling Stock.—The rolling stock consists of three types of wagon:
1. Low-sided four-wheeled trucks with capacity of four tons.
2. Flat bogie wagons with carrying capacity of eight tons.
3. Bogie well wagons with carrying capacity of 10 tons. The latter being used almost entirely for transporting heavy ammunition.

Motive Power.—The motive power consists of:
1. Six-wheeled, coupled locomotives weighing up to 14 tons, capacity 60 H.P., and capable of hauling 65 tons up a gradient of 1 in 40.
2. Four-wheel coupled locomotives weighing up to eight tons, capacity 35 H.P., and capable of hauling 40 tons up a gradient of 1 in 40.
3. Petrol tractors weighing up to four tons and capable of hauling a load of 14 tons up a gradient of 1 in 40; these petrol tractors have two gears, the speed on the low gear being about four miles and on the high gear 10 m. per hour.

During the latter part of the World War 1917–8 light railways were very extensively used on the western front for transporting supplies to the smaller supply depôts away from the standard gauge railways, and ammunition to the heavy gun and howitzer positions. During 1917–8, 1,780 m. of light railway were laid but only about half of this was ever used. While the War was stationary light railways were of very great service to the armies, but as soon as a retreat or a continued advance took place they soon became out of action. They are not economical, the maintenance alone during 1917 being on an average 15 men per mile, which, as the lines became consolidated was reduced to five men per mile. The average effective haul of a locomotive was 23 train m. per day, and that of a tractor was 20 train m. per day. The average coal consumption per locomotive was 62 lb. of coal per effective train mile and the average petrol consumption per tractor was ·56 gal. of petrol per effective train mile. The average loaded wagon mile per day per effective w 4·25.

With the advance in Sept. 1918, light railways were of gre assistance in getting forward ammunition and evacuating t wounded. They were joined on to the German 60 cm. railwa which had not been destroyed, but they were soon left behi and the armies relied entirely on the standard gauge railwa and road transport.

Light railways, when worked to their maximum capaci carry, on an average, about 140 tons of supplies per mile of tra per day, according to the grading of the line, and the cost in ma power for operating purposes only, as compared with a standa gauge railway, is as 3·45 to 1 per m., and cost in man power f construction as 2·2 to 4·7.

An extension to light railways, known as "*foreways*," and us for carrying supplies from the end of the light railways up to t trenches, consisted of 60 cm. gauge track laid on an unballast formation; the rails weighing about 9 lb. per linear yard rail on sleepers weighing 8 lb. and spaced 3 ft. apart, centre centre; on these lines, flat-topped, four-wheel trollies we pushed by two men during the night right up to the communic tion trenches. Early on in the War the armies objected to the foreways being laid with steel rails urging that the noise steel wheels grinding on steel rails would attract enemy fi The first of these lines were made of pitch pine rails nailed on wooden sleepers; but the friction between steel wheels and woo en rails was so great that the trollies were continually bei derailed. (D. L.)

LILLE (*see* 16.685), the fifth largest town in France, had population of 200,952 in 1921. About 1,000 houses were d stroyed by German guns in 1914, and during the German occ pation a munition dump on the southeast ramparts blew causing much damage. The old church of St. Margaret w partially and the Hôtel de Ville completely destroyed. Befo their departure the Germans blew up several of the town bridge The Palais des Beaux Arts, from which many works of art we removed in 1914, has been reconstructed. Lille was made t seat of a bishop in 1913. Before the War Lille provided so four-fifths of the French production of cotton and linen fabri and yarn, and both industries were in a flourishing conditio but the War caused immense loss; only one flax spinning m was in a condition to resume work soon after the Armistice, a it is computed that two-thirds of the total number of spindl were lost. Their replacement, however, was practically co pleted by 1924, and the industry gradually recovered, thou handicapped by scarcity of labour and yarn and the high pri of the latter.

The War Period.—Lille was first reached by advance Germa patrols in Aug. 1914. It was afterwards re-occupied by t French, but they retired again early in Oct., the serious defen of the city not being part of the general plan of campaign. Aft several days' bombardment the Germans entered on Oct. 1 1914 and remained till Oct. 1918, when they were outflank by the Allied capture of neighbouring towns. The deportati of a large number of citizens in 1916 was the culminating poi of tyranny suffered by the people of Lille under German rul The city was a favourite resort for German officers on leave, it was not shelled by the Allies, although it was within range the guns.

LIMA, PERU (*see* 16.689).—During the 20 years ending i 1926, and particularly since 1920, the city of Lima has experi enced a series of modernising influences. The population, i cluding that of Callao, was in 1926 estimated at 250,000 and wa slowly rising. Many of the narrow streets radiating from Pla Mayor, the heart of the city, have been paved, and new busine houses have been erected, including one of the finest hotels i South America. Large sums have provided modern sanitation waterworks and sewerage. In the Exposition and other newe parts of Lima, avenues and boulevards radiate from attractive circles and modern parks; there are thousands of ornamenta trees, and many fine residences face these modern streets and boulevards. Seaside resorts at La Punta, Chorrillos,

aflores and Ancon are growing, and electric car lines and
or vehicles link them with Lima.
he educational system has made marked progress under
sed laws. The general increase of Peruvian cotton, sugar,
ep-farming, petroleum, mining and new irrigated areas is the
is of this progress. Revised taxation provides several million
ars annually for highway construction. A motor-car in
5 succeeded in making the trip over the trail from Lima to
quipa. Automobiles can now be operated from Lima to Piura.
nent, cotton and other Lima industries are increasing their
put, while land values in the capital and suburbs have
e than doubled in a decade.

IMAN VON SANDERS, OTTO (1855–), German soldier,
born in Stolp, Prussia, Feb. 17 1855. Entering the German
ny in 1874, he held various posts in the cavalry and in 1913
was sent to Turkey as leader of a German military mission.
appointment as commander of the I. Turkish Army was
ulled on account of Russian protests, but he remained in-
ctor of the Turkish Army. Made a Prussian general in
1914, in Nov. of the same year he was given the chief
mand of the Turkish troops in the Caucasus. In March
5, as commander of the V. Turkish Army, he successfully
osed the British and French attacks on the Dardanelles and
peninsula of Gallipoli. In 1918 Von Sanders succeeded Von
Goltz as leader of the Turkish forces in the Middle East,
was thus in command in Syria and Palestine when General
nby was victorious there. Von Sanders escaped capture,
after the Armistice he gave himself up to the Allies and was
rned until Aug. 1919. He gave an account of his experiences
Turkey in *Fünf Jahre Turkei* (1920).

INDAU, PAUL (1839–1919), German dramatist and novelist
16.717), published in 1909 a collection of short stories *Der*
ld des Tages. A volume of memoirs, under the title *Nur*
nnerungen, appeared in 1917. He died in Berlin Jan. 31 1919.
elder brother, RUDOLPH LINDAU, died in 1910.

INDENTHAL, GUSTAV (1850–), American engineer,
born at Brünn, Austria, May 21 1850, and was educated
re, and at Vienna. Having been engaged in railway and
lge work in Austria and Switzerland, he went to the United
tes in 1871. He was engineer at the Centennial Exposition,
ladelphia, from 1874 to 1877, after which date he practised
Pittsburgh as consulting engineer in railway and bridge con-
ction till 1890, when he moved to New York City. He was
nmissioner of bridges for the City of New York, 1902–3. He
gned and acted as consulting engineer for the steel arch
lge spanning the East river at Hell Gate. This bridge, known
Hell Gate Bridge, was commenced Nov. 1914, and opened
traffic March 1917. With its approaches, it is about $3\frac{1}{2}$ m.
ength, and contains the longest steel arch in the world (1,017
). Its cost was approximately $18,500,000.

INDLEY, NATHANIEL LINDLEY, BARON (1828–1921),
lish judge (*see* 16.719), died at Norwich Dec. 9 1921.

INDSAY, NICHOLAS VACHEL (1879–), American
er, was born at Springfield, Ill., Nov. 10 1879. In 1897 he
ered Hiram College, O., but left after three years to study
in Chicago and New York. For several winters he was a
I.C.A. lecturer, and during 1909–10 lectured for the Anti-
on League in his native state. Meanwhile he had begun
ng the summers a series of wanderings on foot which carried
through many states, reciting or singing his own verses like
ncient minstrel and delivering an occasional lecture, receiv-
in return food and lodging. In 1920 he visited England,
re he gave recitals. Many of his poems have the true ballad
, and are very popular.

s works include *General William Booth Enters Into Heaven, and*
Poems (1913); *The Congo, and Other Poems* (1914); *Adventures*
e Preaching the Gospel of Beauty (1914, prose); *The Art of the*
ing Picture (1915, prose); *A Handy Guide for Beggars* (1916,
e); *The Chinese Nightingale, and Other Poems* (1917); *The Golden*
of Springfield (1920, prose); *The Golden Whales of California,*
Other Rhymes in the American Language (1920); *Going-to-the-Sun*
3); and *Going-to-the-Stars* (1926), the two latter being illus-
d by the author.

LINDSAY, NORMAN (1879–), Australian artist, was born at Creswick, Victoria, Feb. 23 1879. He began to draw for a Melbourne newspaper at 16, and in 1901 moved to New South Wales where he afterwards lived. He joined the staff of the Sydney *Bulletin*, and became its chief cartoonist, a post which he retained for many years. His chief characteristics as a cartoonist are imaginative power, grim strength, marked individuality of style and a certain coarseness. All of these qualities are apparent in his illustrations to Theocritus, Boccaccio, Casanova and Petronius, the best of which have been collected in *The Pen Drawings of Norman Lindsay* (1918). As an etcher he shows extraordinary facility in the treatment of flesh and massed figures; and he also achieved distinction as a painter in oils and water colours, a lithographer, an engraver and a maker of model ships. In 1925 an exhibition of his paintings was held at the Leicester Galleries, London.

LINDSEY, BENJAMIN BARR (1869–), American judge, was born at Jackson, Tenn., Nov. 25 1869. He was educated in the public schools and attended Notre Dame (Indiana) University and the Southwestern Baptist University, Jackson, Tennessee. At the age of 16 he began to earn his livelihood in Denver, continuing his studies in a law office. He was admitted to the Colorado bar in 1894. In Jan. 1899 he was appointed Public Guardian and Administrator of Denver. He was instrumental in securing the passage of The Colorado Juvenile Court Law of April 12 1899, which gradually changed the whole system of dealing with juvenile offenders in Denver, the change including the establishment of a Juvenile Court conducted solely in the interest of children. He was appointed judge of that court in Dec. 1900, to which he has since been elected for ten consecutive terms. Because of his championship of Juvenile Courts, he earned for himself the name of "the Father of the Juvenile Court." He was also the author of the first parental laws in the United States making the Juvenile Court a Parental and Family Court as well, and also of the "Chancery Court Procedure" in dealing with adult offenders. He wrote *Problems of the Children* (1903); *The Beast* (with Harvey O'Higgins) (1910); *Children in Bondage* (with George Creel) (1914); *Pan-Germanism in America* (1919); *The Doughboy's Religion* (with Harvey O'Higgins) (1920); *The Revolt of Modern Youth* (with Wainwright Evans) (1925); *Childhood, Crime and the Movies* (1926) and a large number of brochures dealing with problems of juvenile delinquency, domestic relations and crime. (*See* CHILDREN'S COURTS.)

LINSEED: *see* OILS AND FATS.

LIQUID AIR.—An intensely cold, blue, somewhat magnetic liquid having a density nearly equal to that of water is obtained by subjecting compressed air to the action of intense cold. At atmospheric pressure, air liquefies at a temperature of −191·4° Centigrade. The properties of bodies plunged into it are greatly altered; *e.g.*, flowers and other delicate objects become exceedingly brittle and lead becomes hard, elastic and sonorous.

Cailletet Process.—Many unsuccessful attempts to liquefy air were made before M. Louis Cailletet, of Châtillon-sur-Seine, announced to the French Academy, in Dec. 1877, that he had liquefied air by a process in which cooled, compressed air, previously freed from carbon dioxide and moisture, was caused to issue from a nozzle into a receiver so as to expand suddenly; the receiver was made of glass and liquefaction was apparent from the formation of a mist.

Pictet Process.—At the same time, M. Raoul Pictet, of Geneva, working independently, made known his success, achieved by using a cascade or successive temperature-fall process. He obtained a temperature of about −65° C. by the expansion of sulphur dioxide around an arrangement of tubes in which carbon dioxide was being liquefied and then using the resulting liquid to obtain a temperature of about −130° C. around a tube conveying compressed air to a nozzle whence the air issued.

Other Processes.—By both these processes, liquid air was obtained but only to evaporate almost as soon as it was formed. The next achievement was the production of liquid air in quantities large enough to be collected. The importance of using a temperature as low as possible to effect liquefaction was more fully appreciated and MM. Olszewski and Wroblewski of Cracow used ethylene instead of carbon dioxide in their cascade process and obtained a temperature low enough to effect liquefaction without final expansion of the compressed air. Another cascade process, carried out at the Cryogenic Laboratory of Leyden, under the direction of Prof. Kamerlingh-Onnes, made use of a temperature of −150° C., obtained by using methyl chloride and ethylene. During a long period of experiments, Prof. Dewar made large quantities of liquid air; he usually obtained the successive falls in temperature by means of liquid carbon dioxide and ethylene.

The cascade processes were complicated and too costly for commercial use and were abandoned in favour of improved expansion methods. As early as 1857, Mr. C. W. Siemens obtained provisional protection for an invention for obtaining very low temperatures by causing cooled compressed air to expand in an engine; the cold air thus produced was used to cool the compressed air on its way to the engine, a cold intensifying effect being thus obtained. No complete patent specification was filed and nothing further seems to have been done by the inventor. An apparatus of this type was patented, however, by M. Ernest Solvey of Brussels (British specification No. 13466 of 1885). It comprised an annular chamber in which compressed air expanded while doing work on a piston fitted in an extension of the outer wall of the annular chamber; this chamber was protected by a jacket packed with a thick layer of non-conducting material. It was assumed that, by the cold-intensifying effect obtained, as in Siemens' apparatus, liquefaction of the air would be effected. In practice, however, this did not take place. The difficulties of lubricating and working the engine and the inefficiency of the jacket prevented attaining a temperature below about −95° C.

Linde Process.—A process depending on reduction of temperature during expansion, but not employing an expansion engine was invented by Prof. Carl Linde, of Munich. The apparatus, described in British Specification No. 12528 of 1895, comprises an air compressor communicating with a cooling coil through which the compressed air passes on its way to a reversed-flow heat interchanger, having two tubes of different diameters and about 300 ft. long; one tube is inserted in the other so as to leave an annular space between them and then both are coiled helically. The convolutions are separated from one another and from the outer casing by raw sheep's wool. Cooled, compressed air passes through the inner coil and issues past a regulating valve into an expansion vessel, whence it flows back, through the annular space between the coils, to the compressor. This cycle of operations is repeated until the cold-intensifying effect of the interchanger becomes so great that some of the compressed air is liquefied, as it passes the regulating valve, and collects in the expansion vessel.

Hampson Process.—In his Patent Specification No. 10165 of 1895 Mr. W. Hampson describes an apparatus in which compressed air is passed through a long pipe and expanded to a lower pressure to return in its expanded state over the pipe in such a way as to intensify the cooling produced by the expansion.

Claude Process.—An ingenious process, invented by M. Georges Claude of Paris, employs an expansion engine working in association with a reversed-flow heat interchanger and a liquefying chamber. Pure, cold air at a pressure of about 40 atmospheres passes through the central pipe of the interchanger, and the greater part of this air is led to the expansion engine and expands therein to a pressure of about four atmospheres, while doing external work. The air leaves the engine at a temperature not substantially lower than −140° C., the critical point for air, enters the lower part of the liquefying chamber, circulates around a series of vertical tubes therein and is led away through the outer annular space in the heat interchanger. The smaller part of the pure, cooled, compressed air passes into the upper part of the liquefying chamber, flows through its tubes and is cooled and liquefied, the liquid air falling into the lower part of the chamber, whence it is withdrawn. By this means, the compressed air is not allowed to liquefy in the expansion engine, which can be worked satisfactorily, lubrication being effected, when necessary, by means of petroleum ether. In a modification, compound expansion is employed, an additional expansion cylinder with its corresponding liquefying chamber being provided. According to M. Claude (*Comptes Rendus*, vol. 142, p. 1335), the output of liquid air may be as much 0·66 litre per horse-power hour in the single expansion and c in the compound process.

Manufacture of Oxygen.—The most important use of liq air is in the manufacture of large quantities of commercia pure oxygen. Prof. Linde, in his British Patent Specificat No. 12528 of 1895, describes a process and apparatus, work in association with his liquefying apparatus, for obtaining oxy from the liquid air by fractional evaporation, the nitrogen be driven off first, since its boiling-point is about −194° C. wh that of oxygen is −182·5° C., at atmospheric pressure. T products were substantially pure oxygen and nitrogen mi with a rather large quantity of oxygen. The purer the oxy obtained the less was the yield. To remedy this disadvanta Prof. Linde, in a later improvement, treated the liquid air i rectifying column and completed the process of separating oxygen and nitrogen by a fractional evaporation.

Other Gases.—Since the introduction of Linde's process obtaining oxygen, numerous inventions have been patented obtaining oxygen, nitrogen, argon, helium, neon, xenon a krypton from the air. In the processes of M. Claude and Société l'Air Liquide, the air is not liquefied as a whole but such a way that it yields two liquid portions, one rich in oxyg and the other very rich in nitrogen; each of these liquid portio is rectified so as to obtain oxygen and nitrogen of a high deg of purity. For further information the reader is referred to t reports on the cross-action in the Chancery Division and t Court of Appeal between British Liquid Air Co., Ltd. and Br ish Oxygen Co., Ltd. (*Reports of Patent Cases*, 1908, pp. 218– 577–614).

Liquid air is applicable for cooling objects which are requi to be hooped and for fitting metal tubes into a tube plate havi holes too small to receive the tubes. The use of liquid air a motive fluid has been often proposed. An early use of liquid was in the preparation of explosives, some of which were us during the construction of the Simplon Tunnel. Liquid air h also been used in mine rescue apparatus.

LIQUOR CONTROL (*see* 16.759).—In this article it is propos to give the outlines of restrictive legislation in respect to liqu except as regards prohibition in the United States, which treated under PROHIBITION. *See* also BOOTLEGGING.

I. IN GREAT BRITAIN

In 1913 the Act was passed granting, *inter alia*, local opti to Scotland. The Act provided that one-tenth of the electors the area concerned could demand a poll to decide on the con tions of sale of intoxicating liquor. If 55% of the poll and 35 of the electors voted for no-licence the resolution to that effe would be carried: for a limitation of licences a bare majority the poll and the votes of 35% of the electors would be sufficie The third alternative to be put before the electors in each ca was a resolution for no change. The local option sections of t Act did not come into operation until 1920; the result of a p thereunder is binding in the area concerned for three years, a no further poll can be taken during that time.

Defence of the Realm Regulations.—The outbreak of the E ropean War, in 1914, at once raised the question of the necessi of some form of liquor control alike in the interests of efficien in the fighting forces and amongst civilians engaged in munitio works and other vital industries, and of economy in the provisi of essential supplies. The Defence of the Realm Act 1914 a thorized the creation by Orders in Council of new authorities t provide for the safety of the Realm, and the delegation to suc new or to existing authorities of power to issue regulations fo the same purpose.

Under this Act regulations were immediately passed en powering competent naval and military authorities to contr the opening of licensed houses in the neighbourhood of defende

ours. and forbidding the sale or supply of intoxicating
or to members of H.M. forces on duty or with intent to in-
acitate them for duty. By further regulations in subsequent
rs the same authorities were to close down or regulate the
ning of licensed houses and to prohibit trading within the
under their control, and received further special powers
r dockyards. In 1916 a general order was made under the
prohibiting the supply of intoxicating liquor to members of
fighting forces on duty or in hospital. When the food short-
became acute, the Food Controller imposed stringent re-
tions on output in 1917–8.

iquor Control Board.—The Liquor Control Board was created
une 1915, as the authority empowered under the Defence of
Realm Act (No. 3) 1915 to issue regulations under the 1914
to control the liquor trade in any district to which such
trol should be applied by Order in Council. The board was
ed with wide discretionary powers including those of closing
n licensed premises and clubs, regulating the hours of open-
irrespective of the provisions of the Licensing laws, prohibi-
of the sale of specific liquors and of treating, and generally
egulating the supply and sale of intoxicating liquor. The
trol by the board was first applied to the Lowlands of Scot-
l and the more important shipbuilding and industrial centres
England, but it was subsequently extended until, by the
dle of 1918, it had been applied to 29 areas covering in all
e-quarters of England, Scotland and Wales.

these areas the Board reduced the permitted hours of sale of
intoxicating liquors on week-days, which before the War had
ged from $19\frac{1}{2}$ hours in London to 11 hours in Scotland, to a general
imum of $5\frac{1}{2}$ hours for consumption on licensed premises and $4\frac{1}{2}$
rs for off-sales, with a further reduction on Sundays of half an
r in each category. In the case of spirits the off-sale was further
ailed to $2\frac{1}{2}$ hours 5 days in the week, and was prohibited alto-
er on Saturday and Sunday. In certain areas in the North and
t of Scotland the sale of spirits was, at the instance of the
iralty, prohibited absolutely and this prohibition remained in
e until 1919. The Board further introduced compulsory dilution
pirits: spirits which before the War were retailed at 25° below
f (or 35·91 % pure alcohol) were obliged to be diluted to 30°
w proof (or 33·37 % pure alcohol), and were permitted to be sold
0° below proof (or 23·49 % pure alcohol). Further regulations
e made forbidding treating and extending existing provisions
inst credit sales of intoxicating liquor in licensed houses and clubs,
making illegal the common practice in the trade of giving an
ssive measure to customers known as the "long pull."

reviously to the special powers given to the Liquor Control
rd, extended powers had been given to the licensing justices
the Intoxicating Liquor (Temporary Restriction) Act 1914,
in view of the wider powers exercised by the Board these are
parativeIy unimportant. Many of the Board's regulations
tinued in force after the termination of hostilities in 1918,
the Board was not finally abolished until the passing of the
ensing Act of 1921.

icensing Act 1921.—That Act, which applied to both Eng-
and Scotland, adopted and made permanent some of the
lations which the Board had instituted, notably the prohi-
on of the "long pull" and of credit sales in the case of "on"
sumption. The Act fixed the permitted hours of sale at 9
rs in London and 8 hours elsewhere, between 9 A.M. and 11
in London, or 10 P.M. elsewhere, and made them applicable
only to licensed premises, but also to registered clubs which
re the War had been free from such restrictions. The times
pening of licensed premises within the fixed limits were left
he discretion of the local licensing authorities, and in clubs
he option of the members, the hours so fixed to be included
he rules. The Act also encouraged dilution by permitting all
its to be sold without special notice at 35° below proof, in-
d of the standard of 25° below proof required before the War
all spirits except gin. On the other hand beer of an original
ity not exceeding 1·016° and containing not more than 2%
roof spirit was by the Act not to be treated as intoxicating
or, and no excise duty was required for its sale.

ale to Young Persons.—In 1923 a bill was introduced in the
se of Commons by a private member, Lady Astor, and be-
e law, prohibiting the sale of intoxicating liquor to young persons under 18 for consumption on licensed premises, with a slight modification allowing certain non-spirituous alcoholic drinks to be served with a meal in the case of young persons over 16.

The Carlisle Experiment.—An important experiment of the Liquor Control Board, which has remained as a permanent institution, was the introduction in 1916 of a system of state purchase and state supply of intoxicating liquor in certain areas. It was first tried in the Carlisle area to combat drunkenness amongst the many thousands of munition workers drafted into the district for the new factories around Gretna. In view of the differences in English and Scottish licensing law, Gretna and Carlisle were made into separate districts for administration, and a third district was subsequently created when the experiment was extended to the area of Cromarty Firth including Dingwall and Invergordon. The working of the system was in the hands of the Board with the assistance of local advisory committees. On the final abolition of the Board its functions were taken over by the Home Office and the Scottish Office respectively.

The system was to purchase all breweries and licensed premises in the districts for agreed sums by way of compensation. Some of the breweries so purchased were closed down, the number in the Carlisle district alone being reduced from five to three, with considerable saving in working expenses in all cases, and the number of licences was cut down by nearly one-half. In addition all grocers' licences were suppressed, and facilities for "off"-sales reduced by about 80%. Many of the licensed premises retained were renovated, and where possible considerable structural improvements were made to allow for the provision of cheap and good meals; and disinterested management was completed by the appointment of salaried publicans who received commissions only on the sale of food and non-alcoholic beverages, and did not have to consider the interests of shareholders or of brewers or of competitors. Under this system no liquor advertisements are displayed on licensed premises, and no money is spent in advertising intoxicants either in newspapers or on hoardings. Further no money made out of the sale of intoxicants can be subscribed by the department which is responsible for providing drink to any political organisation or to any anti-temperance propagandist body.

II. MEASURES IN OTHER EUROPEAN COUNTRIES

Denmark.—A comprehensive licensing law came into force in Denmark on Jan. 1 1913. The new law had for its object the effective regulation and control by the municipal and communal authorities of all places of entertainment where meals, lodgings, refreshment, etc., are provided. A distinction in the regulations was made, as in other Scandinavian countries, between urban and rural districts.

The new law established "off" and "on" licences for the sale of "strong drinks" which included spirits, wines and all beers which contained $2\frac{1}{4}$ % or more alcohol. Special licensing boards were constituted in each municipality, to whose discretion the allocation of licences was absolutely entrusted. The licences which might be issued by the licensing boards were to be for life or a fixed term of years, and all licensed premises were to be closed for at least five hours between 11 P.M. and 8 A.M. The age limit below which it was forbidden to supply young persons with strong drinks was to be fixed by local police regulation. In no case was the limit to be lower than 16, and only in four towns is it as low. Stringent penalties were enacted for violation of the Licencing Law, including heavy fines, imprisonment and forfeiture of the licence.

During the War, the distillation of spirits from home-grown wheat or rye was prohibited, though not from potatoes. An important law which came into operation in 1925 fixes the number of licensed premises in existence on Jan. 1 1924 as the maximum. New licences are subject to a form of local option, and the local authorities are empowered to restrict the issue of a new licence to a public utility company on the Gothenburg principle.

Iceland.—From 1912 there has been complete prohibition of the import or manufacture of liquor containing more than $2\frac{1}{4}$% of alcohol with limited exceptions for medical and industrial use. A slight relaxation has, however, since been made, under pressure from Spain, to permit the importation of Spanish wines.

Sweden.—An important piece of liquor legislation was the law of 1917 which made the "Bratt System" universal throughout Sweden. This system of liquor control, which came into force throughout Sweden on Jan. 1 1919, was a striking development, on the basis of the "Gothenburg System" of disinterested management through controlling Companies, or "Bolags." The "Gothenburg System" had been confined to the control of the retail sale and distribution of the national spirit or "brännin." The sale of wine, beer and imported spirits had been outside its monopoly.

The effect of the new law was to bring the retail liquor trade—the trade in ordinary beer excepted—under the control of the System companies. All intoxicating liquors of an alcoholic strength greater than 3·6% were thus affected. The beer manufactured and sold in Sweden is below that strength.

The transfer of "off" spirit licences was abolished; the import of spirits, wines and beers was only permitted through the agency of the "Bolags"; and the maximum amount of spirits purchasable by each citizen was limited to 4 litres *per mensem*. A new age limit was fixed, and persons under 21 and sometimes 25 were not allowed the right to purchase distilled liquor. Convicted drunkards were also debarred from purchasing intoxicants.

The private trader, however, still retained his interest in the wholesale liquor trade. The organisation of the wholesale trade under the System Companies was brought about through an enterprise founded by Dr. Bratt and his associates in 1917, called "Spritcentralen," which, by an enactment in 1923, obtained from the Government the right to the exclusive wholesale sale of liquors other than beer until 1928. The system worked by the "Bolags" is one of personal control, in which the "motbok" or pass-book, plays a large part. The "motbok," in effect, is a ration book with coupons entitling the holder to purchase his prescribed quantity of liquor in each month, and no more.

Norway.—A system of disinterested management has also been in force in Norway for a considerable period. The "Samlag" in Norway takes the place of the "Bolag" in Sweden, though its powers are more limited. The "Samlags" control the sale of "Braendevin," the national Norwegian spirit, whilst beer and wine, except in rare instances are still in the hands of private traders.

The Norwegian system, based on the Acts of 1871 and 1894, left two options open to each community at the periodical poll:

1. The "Samlag" system for the retail sale of spirits, or
2. Prohibition of all retail sale of spirits.

The results of the 1913 polling showed a definite voting down of existing "Samlags": out of 26 towns polling, the "Samlag" was voted down in 15.

But, outside the "Samlags," the sale of spirits is conducted by means of "privileged" (*i.e.*, life interest) licences, wholesale rights and special "off" and "on" licences issued by magistrates and town councils.

During the war period Norway imposed far-reaching restrictions, leading up to the total prohibition of the sale of spirits, both "on" and "off." The continuance of prohibition was endorsed at a national poll in 1919.

III. TEMPORARY WAR REGULATIONS

Liquor legislation in other European countries, since 1911, has mainly been concerned with the imposition of special restrictions during the War period, and the subsequent modification of those restrictions.

France.—In France, for instance, the need for some control of the liquor traffic was recognised soon after the outbreak of the War, and one of the first War-time restrictions was the absolute prohibition of the sale of absinthe in Feb. 1915.

The opening of new establishments for the sale of spirits and other liquors (except those having a wine basis) was also forbidden. In 1915, the "off" sale of alcohol was forbidden before 12 noon, and the "on" sale of spirits to women and children was absolutely prohibited. The sale of wine, beers and cider was, however, left untouched. The War regulations have since disappeared.

Switzerland.—On the outbreak of War the Swiss Government prohibited the use of potatoes for the manufacture of spirits, and rationed the sale of spirits by the state monopoly.

Italy.—In 1913 Italy prohibited the importation and manufacture of absinthe and enacted a law requiring special permits for the sale of spirits and liqueurs.

Germany.—In Germany the sale of alcohol was forbidden in the towns during the early mobilisation period; and restrictions were placed on the quantity of malt used in German breweries. Subsequently, in 1915, further restrictions were imposed:

1. The manufacture of spirits for beverages from potatoes an grain was prohibited.
2. The manufacture of beer was restricted by 40 per cent.
3. The sale of intoxicants in mobilisation centres was forbidde
4. In Berlin the sale of spirituous liquors in restaurants was fo bidden between 9 P.M. and 9 A.M.

Austria-Hungary.—Similar restrictions on the manufacture spirits from potatoes and grain were imposed in Austria-Hungar during the continuance of the war emergency period.

Russia.—In Russia, the fact that a Government monopoly of th vodka trade had been established in 1894; enabled the Tsar to esta lish its total prohibition on the outbreak of the War. This state things continued under the Soviet *régime* until 1921, when the sal of wine in limited quantities was authorised, whilst the sale of bee was permitted without limitation.

In 1924, by a decree of the Soviet Executive Council, the sale vodka was permitted once more. The sales are restricted by a car system of control, under which each adult citizen is entitled to pu chase one bottle of vodka every 14 days through the agencies of th state spirit monopoly.

Finland.—The prohibition of vodka throughout the war perio applied also to Finland and to Estonia. The prohibition of be over 2¼%, of wine, spirits and stronger beverages was enacted i Finland in 1919, and is still in force.

Estonia.—In Estonia, however, legislation was passed in 192 for the repeal of prohibition and for the substitution of a "Check system for the controlled sale of alcohol, somewhat on the Swedis model.

Belgium.—On the outbreak of War in 1914 the Government too prohibitive measures against the sale of spirits which continued i force during the German occupation. In Aug. 1919 an Act wa passed prohibiting the sale and supply of spirits for consumption the premises in any place of public resort, including hotels, resta rants and workshops. The "off-sale" of spirits was authorised pr vided that at least two litres were sold at a time to each purchase This Act was a modification of a scheme of total prohibition whi had been promulgated by decree only when the Government had i seat at Havre in Nov. 1918.

In Poland in 1921 a law was passed introducing the local opti principle. In 1924 a Government monopoly of the liquor trade wa established under which the Government assumed the entire contr of the manufacture and sale of all spirits.

Latvia and Lithuania have adopted laws regulating hours and co ditions for the retail sale of alcohol.

For the supply of intoxicating liquor in mandated territories, *se* MANDATES.

IV. THE UNITED STATES AND CANADA

The article on Liquor Laws in the United States (*see* 16.76 reviews legislation prior to 1910 in its historical developme and under the four chief types of state and local legislati control: (*a*) the licence system, (*b*) state prohibition, (*c*) loc option, a combination of licence and prohibition, and (*d*) publi dispensaries. It also covers Federal regulation of the liqu traffic: (*a*) in inter-state commerce, (*b*) in Federal territor such as the District of Columbia, military and naval st tions, Indian reservations, and in certain particulars in th insular possessions, and (*c*) the revenue laws where regulatio is frequently a dominant motive in tax policy. Since 1910 the have been hundreds of state laws, local ordinances and Federa laws, not directly related to the adoption of national prohibitio (*q.v.*) as well as many important decisions of Federal and Stat Courts. This further illustrates the great diversity of procedu and methods and the wide range of legislative experiment i dealing with the liquor traffic and its attendant evils, whic probably has no equal in any other country in the world or i any other period of history. It also reflects the very grea difficulties encountered in the enforcement of such legislatio and in correcting unforeseen evils arising as by-products o regulatory measures. A fairly complete and accurate descriptiv list of these measures will be found under "Chronology" in th Year Books of the Anti-Saloon League (pub. Westerville, O. especially the Year Book for 1919.

The 18th Amendment.—War-time prohibition became effectiv on July 1 1919, and the Prohibition (18th) Amendment t the Constitution was ratified Jan. 16 1919, effective Jan. 16 1920, d the combined War-time Prohibition Enforcement Code and e Constitutional Prohibition Enforcement Code, known as the National Prohibition Act” and, popularly, as the Volstead law, as adopted Oct. 28 1919, in part effective immediately and in rt relating to constitutional prohibition effective Jan. 16 20 (*see* PROHIBITION).

As far as state and local measures (1910–9) are concerned ere were no new devices for regulation, and nothing to show y serious departure from the types of regulation referred to ove, and discussed in the previous article. There was a notice- le trend away from the public dispensary and the many oposals to eliminate private profits from the industry or the ade, such as those involved in the Gothenburg system, which is widely discussed, and licensing non-profit trading companies. ere was also a marked and increasing trend in all sections of e country toward the extension of dry territory, the protec- n of dry areas under local option, and the extension of state- de prohibition.

State Prohibition in 1910.—In 1910 state prohibition was in ce in nine states. Large areas of local territory in other ates were dry under local option. It was difficult to protect is dry territory from violation through illicit trade aided and omoted by adjacent wet areas. Texas in 1910 passed a law aking the sale of liquors in no-licence territory a felony punish- le by from three to five years' imprisonment. All the prohibi- n states had tried in various ways to check the flow of liquor otected in inter-state commerce over which the Federal thority had exclusive jurisdiction and with which no state d any constitutional right to interfere. Congress had sought aid in this effort in the Wilson Act in 1890 to divest in- xicating liquors of their inter-state character by providing at “Liquors transported into a state . . . shall . . . on arrival in such state . . . be subject to the operation d effect of the laws of such state enacted in the exercise of its lice powers, to the same extent . . . as though such . . . uors had been produced in such state.”

Although the Wilson Act presented grave constitutional ficulties it was sustained by the Supreme Court in *In re hrer* in 1898 (140 U.S. 545) but the rule of the decision in- rpreted the phrase “upon arrival in such state” to mean at state control and regulation operated only “after the ship- ent had reached its point of destination and had actually been livered to the consignee.” This was not sufficient to stop e flow of liquor from wet areas outside the state. A Mis- uri statute imposing an inspection fee on all liquors shipped m other states into Missouri and offered for sale was upheld 1905 (190 U.S. 17) as an exercise of the police power of the te within the meaning of the Wilson Act, and the chief aim the Act was undoubtedly to increase the state's control over er-state shipments. The Iowa Legislature had in the pre- us year 1904 passed a resolution asking Congress to amend e inter-state shipment law to prevent the shipment of liquors m one state to the dry territory of another.

In the meantime the Supreme Court in *Delameter v. So. kota* (205 U.S. 93), decided March 11 1907, upheld a South kota statute imposing an annual licence charge upon the siness of soliciting orders for intoxicating liquors and its plication when orders were to be filled from liquors at the ne without the state. This was another method of checking er-state traffic from wet areas to dry and of enforcing state ulation or prohibition. Still another effort was made in the ne direction and this time with the direct assistance of Con- ss in the Act to codify, revise and amend the penal laws of United States approved March 4 1909. Section 238 forbade transportation company or its agents to deliver intoxicat- liquors in inter-state or foreign commerce to any fictitious son or to any other person than the consignee, unless up- written order of the bona-fide consignee, and Sec. 239 forbade collection by the transportation company or its agents of the chase price or in any manner acting as the agent of the buyer seller of such liquor, and Sec. 240 forbade the shipment in er-state or foreign commerce of any package containing intoxicating liquors unless “such package be so labelled on the outside cover as to plainly show the name of the consignee, the nature of its contents and the quantity contained therein.” Each of these sections provided heavy penalties for their violation.

The Webb-Kenyon Law.—With the passage of the Webb-Kenyon law, March 1 1913, Congress and the Federal Government took the first aggressive step in aiding effective state prohibition. The title of the Act, “An Act divesting intoxicating liquors of their intra-state character in certain cases,” indicates its broader scope and purposes as compared with the earlier Wilson Act which merely removed the bar of the Original Package decision (1890) to effective enforcement by holding that a state prohibitory law was inapplicable to sales of liquor in the original packages in which they were received from other states (*Leisy v. Harden*, 135 U.S. 100). The Webb-Kenyon Act removed another bar, namely, the Federal protection of inter-state commerce, from the exercise of a state's conceded powers over inter-state when applied to such inter-state commerce as Congress, in the exercise of its exclusive powers over inter-state commerce, has interdicted or from which it has removed the protection of inter-state commerce. Congress in this Act forbids the transportation of intoxicating liquors into a state by any persons interested therein “to be received, possessed, sold, or in any manner used, either in the original package or otherwise, in violation of any law of such state.” The Act presented grave constitutional difficulties, which led President Taft to veto it on purely constitutional grounds, and in this judgment he was supported by his able attorney-general, Mr. George W. Wickersham, and the ablest lawyers in the Senate. Nevertheless, Congress passed the Act over the veto of the President, and the Supreme Court sustained its view in the Clark Distilling Co. v. Western Maryland Railway Co., and Clark Distilling Co. v. American Express Co. and the State of West Virginia cases (242 U.S. 311) decided Jan. 8 1917.

Effects of Webb-Kenyon Law.—The immediate effect of the Webb-Kenyon law was to stimulate state prohibition. The year 1914 saw state constitutional prohibition amendments adopted by popular vote and substantial majorities in Arizona, Colorado and Washington, and rejected by substantial majorities in California and Ohio. A state-wide prohibition law in Oregon was adopted by a popular vote of 136,842 for, to 100,362 against, and in Virginia by a majority of 30,365 out of a total of 150,000 votes. A considerable extension of dry territory was secured under local option votes in many other states. That this rising tide of prohibition was not confined to the states is seen in the adoption for the first time in 1914 in either House of Congress of a resolution submitting a prohibitory amendment to the Federal Constitution. The Hobson resolution passed the House of Representatives Dec. 22 by a vote of 193 to 189, but did not receive the two-thirds majority required. In 1915 Alabama re-enacted a prohibitory law which was adopted in 1907 and repealed in 1911, and Idaho, Iowa, Arkansas and South Carolina adopted state-wide prohibitory laws, Idaho, in addition, submitting to the people of the state a constitutional amendment, which was adopted in 1916 to become effective Jan. 1 1917.

The year 1916 also witnessed constitutional state prohibition adopted in Michigan, Montana, Nebraska and South Dakota. In 1917 Congressional action again moved forward. The resolution for the prohibition amendment to the Federal Constitution received the necessary two-thirds majority in both Houses, and the amendment was submitted to the states for ratification. Congressional enactments also prescribed prohibition for the District of Columbia and for the territory of Alaska. A referendum on prohibition was provided for the I. of Porto Rico, which voted in July 1917 to adopt it by 99,775 for, to 61,295 against. Early in 1917 Congress enacted the anti-liquor advertising law with the so-called Reed “bone-dry” amendment, the whole being an amendment to the Post Office Appropriation Act. This was a drastic prohibition of the use of the mails for advertising, or soliciting orders for liquor in “dry” territory, and was, therefore, a further application of the principle of the Webb-Kenyon Act.

Among the states in 1917 Indiana, New Hampshire and Utah adopted state-wide prohibition statutes, and New Mexico a prohibition constitutional amendment. This made in all 25 of the 48 states, and, in addition the District of Columbia, Alaska and Porto Rico, which had adopted statutory state-wide or constitutional prohibition before the Federal Amendment was submitted for ratification; and in 1918, while ratification was proceeding, Florida, Nevada, Ohio, Texas and Wyoming adopted state-wide prohibition statutes. Utah adopted a prohibitory amendment to the state Constitution. Congress enacted a prohibition statute for Hawaii, and passed the War Prohibition Act as an amendment to the agricultural appropriation bill. A constitutional prohibitory amendment received a majority of 15,932 votes in Minnesota, but failed by 756 votes to receive the majority required by the state election law. A constitutional state prohibition amendment was defeated in Missouri by 300,354 votes against, to 227,501 for; and also in California. Other state measures extended dry territory, and in several states state constitutional amendments were submitted to be voted on in 1919. The war prohibition Federal legislation is noted under *After Ratification-Provisions for Enforcement* in the discussion of prohibition (*q.v.*).

State Action Since 1919.—From Jan. 10 1919, the date when the Federal Constitutional Amendment received the necessary ratification by two-thirds of the states, to 1926 state legislation in relation to prohibition, chiefly consisted in state enforcement measures of great variety based on the concurrent powers provided for in the amendment although in some states, a state constitutional amendment or state-wide prohibition statutes, previously adopted went into effect by their terms after Jan 1 1919. In all to date (1926), 47 of the 48 states (Maryland alone excepted) have adopted state codes or measures to enforce national prohibition. New York alone has repealed such a statute; and no other state has weakened its enforcement legislation by subsequent amendments, and several have repeatedly tried to strengthen their enforcement legislation.

THE LAWS IN CANADA

Liquor laws in Canada have followed closely in structure and in the forces determining their modification and enforcement those of the United States. They have not gone as far as to adopt national prohibition except for a brief period during the War, by Order-in-Council, March 11 1918, in force from April 1 1918 until Dec. 31 1919. Since 1910 local option with respect to licence extending to complete provincial prohibition of sale has been permissible under a Federal law, the Canada Temperance Act (1875). But under the British North America Act, which serves as the Constitution of the Dominion, only the Federal authority can prohibit the manufacture, importation, exportation and transportation of liquors for beverage purposes. On May 18 1916 a Federal Act "in aid of Provincial Legislation prohibiting or restricting the sale or use of intoxicating liquors" (6–7 Geo. V. Ch. 19) was adopted and penalised the transportation and delivery of intoxicating liquor or sale for transportation into a province in violation of the law of the province. This effort to remove "Federal protection" from manufacture and shipment, legal under Dominion law, of intoxicating liquors whose sale was prohibited under provincial law or local option votes, was similar to the Wilson and Webb-Kenyon Acts in the United States. This Act was amended Nov. 10 1919 (10 Geo. V. Ch. 21) to include manufacture for illegal sale; but an amendment, adopted on the same day, to the Canada Temperance Act (10 Geo. V. Ch. 9) added Part IV., "Importation and manufacture of intoxicating liquor," and provided an alternative plan which it was thought would be more effective and better applicable locally to accomplish the same purpose. It provided for prohibition of importation and of manufacture for illegal importation in any province by Order-in-Council after an approving referendum had been taken by the Dominion Govt. at the request of the provincial Legislature.

Referenda in All Provinces.—From Feb. 1 1921 to May 21 1923 seven of the nine provinces decided by referenda to prohibit importation. Similarly exportation of liquor from ar province, except by brewers and distillers, could be prohibit by Order-in-Council under a further amendment of 192 Four provinces in 1922 and 1923 invoked this law. Neither t importation nor exportation prohibitions were sufficient witho a real Federal prohibition law to enable the provinces to enfor satisfactorily their province-wide prohibition laws after t Dominion declared the War prohibition for the Dominion at end. So three of the seven prohibition provinces swung over state control, and there were in 1926 only four (Ontario, Ne Brunswick, Nova Scotia and Prince Edward Island) where prohibition of sale continues. In Feb. 1925 an amendment the Ontario Temperance Act permitted the sale of 4·4 bee which does not seem to have made the enforcement of the pr hibitory features of the Ontario Temperance Act any easi Government ownership and sale or state control take vario forms in the different provinces. The amount of liquor so seems to have increased each year since 1921, when Briti Columbia adopted the system of government warehouses a salesrooms with public liquor stores, only on a local vote whi has been favourable thereto, only in the larger cities and town and there is said to be little or no curtailment of illegal sale a the abuses therefrom. In Quebec, Manitoba, Saskatchewa Alberta and British Columbia liquor is sold under governme regulations.

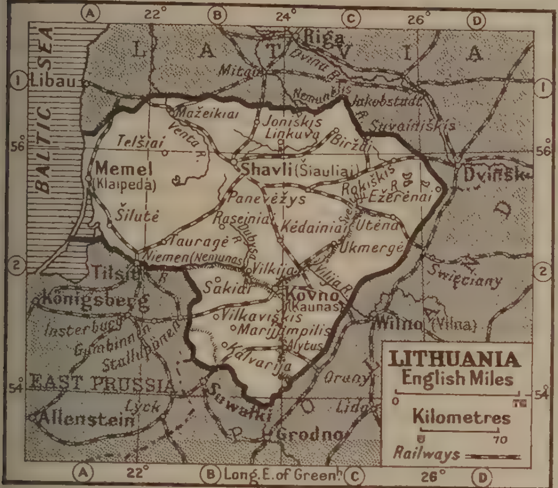
LISTER, JOSEPH LISTER, BARON (1827–1912), British ph sician (*see* 16.777), died at Walmer, Kent, Feb. 10 1912.

LISZT, FRANZ VON (1851–1919), German jurist, a young cousin of the composer, Franz Liszt, was born in Vienna Mar 2 1851. He qualified in 1875 as a teacher of criminal law Graz in Austria, was a professor at Giessen 1879, Marbu 1882, Halle 1889, and in Berlin in 1899. In 1912 he becar a member of the Fortschrittliche Volkspartei (Progressi People's party) in the Reichstag. Liszt's life work was t scientific foundation and reform of the criminal law of whi the basic principles are contained in his treatise *Der Zwe gedanke im Strafrecht* (1882). It opposes the principle of garding punishment as a reprisal and sets up the claim systematic prevention of a special nature. In the fight agai the law breaker, Liszt, together with the Dutchman Van Ha and the Belgian Prins, founded the *Internationale Kriminal tische Vereinigung* (International Criminalist Union) in 1889 which all reforms, which became the basis of modern crimi law, were initiated. Liszt's claims in favour of conditio sentence and pardon as well as postponement of punishm later passed into actual practice. At Marburg he created t Criminalist Seminary, which later in Halle and especially Berlin became a world-famed criminal institute at which stude from all lands met. Liszt was also a leading authority on int national law. He died at Seeheim June 22 1919.

His chief works are *Meineid und falsches Zeugnis* (1876); *Lehrb des deutschen Strafrechts* (1881, 21st ed. 1919); *Lehrbuch des Völk rechts* (1898, 11th ed. 1918); *Strafrechtsfälle zum akademisc Gebrauch*, 13th ed. (1922); *Strafrechtliche Aufsätze und Vortr* (1905). See also *Abhandlungen des Kriminalistischen Seminars* (18 etc.); *Mitteilungen der Internationalen Kriminalistischen Vereinig* (1890, etc.).

LITHUANIA (LIETUVA), an independent European repub and a member of the League of Nations (*see* 9.916). Lithuani territory includes the former Russian Govt. of Kovno (Kaunas parts of Suvalki and Vilna governments and the autonomo territory of Memel. The land frontiers are with Latvia he north, Poland on the east and the south, and East Prussia n the southwest. The Lithuanian seaboard is short, but is xtended by the addition of Memel. The town and territory of ilna (Wilno), claimed by the Lithuanians as part of their state, , incorporated in Poland (*see* VILNA). The area is (1926) 22,590 q. m. and the population, 1924 (excluding Memel), 2,203,312, of hom 83·9% were officially given as Lithuanians, 7·6% as Jews, ·2% as Poles and 2·5% as Russians.[1] The town of Memel inludes 24,000 Germans.

Lithuania is, on the whole, a low-lying country watered by the iemen ("Nemunas"—name of a heathen deity) and its tribuaries. The highest part is in the south and east, where the Baltic ills extend in crescent formation from Gumbinnen in East Prusa through Suwalki (Suvalki) and Vilna (Wilno) to Dvinsk. his chain of hills is broken by two valleys, that of the Niemen owing through Grodno and Olita (Alytus) to Kovno, that of the ilija (Nerys), flowing from Vilna to Janow (Jonaya) to its nction with the Niemen below Kovno. In the northwest is tuated another triangle of hills, the Telšiai-Shavli (Šiauliai)-asciniai. Between these two hilly regions lies the plain of the iemen with its two principal tributaries, the Nevežis and the ubysa flowing in from the north. The only other river of imrtance is the Šventoji, flowing southwest to join the Wilija ar Janow, and in the north the Muša, which joins the Aa ielupe) at Bauska in Latvia.



I. POLITICAL HISTORY

Early History.—(*See* 16.789.) The union between the kingdom of oland and the grand duchy of Lithuania was brought about on Feb. 1386 by the marriage of the Lithuanian Grand Duke Jogaila (Jagiel) to the Polish Queen Jadviga, and was confirmed by the subsequent acts of Vilna in 1401 and 1432, of Horodlo in 1413, of Grodno in 501 and 1512, and, parliamentarily, of Lublin in 1569. Thus was tablished a political combination in which Lithuania in point of rritory was three times the size of Poland. The contracting parties ere to retain their names, laws, administrative institutions, financial d military organisations. Through the fact, however, that from 501 onwards the Lithuanians and the Poles were ruled over by one vereign and from 1569 onwards had a common legislature, the thuanians, though ever anxious to break away, gradually sank into state of dependence. The Poles, past-masters in the art of political trigue, never lost an opportunity of imposing their hegemony. ccordingly the dual state was involved in a common downfall, and the three partitions of 1772, 1792 and 1795, to which it was subcted at the hands of Russia, Prussia and Austria, Lithuania fell a ey to Russia and Prussia. But, while the Tsarist régime, unable to nationalise a homogeneous population of a different religion and nguage, initially conceded a minimum of rights to the Polish nation, Lithuania proper from the outset an unrelenting system of tyranny s established which was designed to break by force every nonssian element in the country.

Russia had annexed the six Lithuanian governments between 1772 d 1795 and united them as the "Litovskaya Gubernia" in 1797, that is to say, before the Treaty of Vienna conceded her the kingdom of Poland in 1815. At the Warsaw diet of 1818, the liberal-minded Alexander I. still spoke of the reunion of Lithuania with Poland under constitutional forms. But the project lapsed because any measure of self-government by extending the power of the Polish "szlachta" (land-owning noble class) in Lithuania menaced Russia's influence in that country. Yet, under the influence of the Polish Prince Adam Czartoryski, Alexander I. encouraged education and enterprise. Under Nicholas I., the plan of the reunion of the two States was definitely rejected, his ukase of 1839 making Lithuania the "Syevero-Zapadni Krai" (northwestern Province).

As a result of the Polish rebellion of 1830, in which the peasantry, whether Lithuanian, Polish or White Russian, did not take so great a part as the upper classes, the Lithuanian Statute, which had remained the law of the land through four centuries of union with Poland, was replaced by the Russian code in 1840. Prominent Lithuanians were forced to emigrate or exiled to Siberia. As even the reign of Alexander II. brought no change in Lithuania, the revolutionary spirit led to the great rebellion of 1863.

This abortive insurrection, in which the Polish nobility and intelligentsia were primarily involved, though the Lithuanians also took a prominent part, led to the suppression of the printing of Lithuanian books by the dictator Gen. Muraviev, which measure was only abolished in 1904. Tsarist policy was henceforth perfectly consistent in that it strove to make Lithuania a genuine part of Russia and sought to extirpate Polish culture beyond the frontiers of the kingdom.

Period of Popular Representation 1905–14.—Russia's defeat in the Russo-Japanese War and the revolution which followed in its wake led, in Sept. 1905, to a measure of reform. The first National Lithuanian Assembly which, however, in the eyes of the Tsar's Govt. was merely a revolutionary body tolerated for the time being, met at Vilna. It consisted of 2,000 delegates who demanded an autonomy for the four governments of Vilna, Kovno, Grodno and Suvalki under a Diet at Vilna. It was the first modern attempt to define Lithuania ethnographically, to respect national minorities and continue the connection with Russia upon the federative principle. The electoral statute of 1905, by granting the four-class franchise (landowners, peasants, townsmen and workmen) favoured the rural population. Only Poles were elected to the first Duma of 1906.

As the Imperial ukase which followed the dissolution of the second Duma of 1907 conferred more power upon the great landowners, it was modified as regards Lithuania by a nationality clause which provided that the total of electors of each class should be in proportion to the amount of land possessed by the respective nationalities in the district. This measure, applied by Russian officials, was designed against the Poles and the Lithuanian Nationalists, for not even the Progressives who favoured autonomy for Poland contemplated its grant to Lithuania. In the third Duma the five delegates allotted to the non-Russian population of the government were all Poles who joined the Polish party; in Kovno three delegates were Lithuanians, one was a Pole and one a Jew.

The War Period.—The outbreak of the World War in 1914 led to a German invasion which, from midsummer 1915 until Aug. 1919, lay heavily upon the land. To further their own purpose, which was the lasting hold over Lithuania, the Germans after the military collapse of Russia allowed the phantom existence of a state. A Lithuanian conference met at Vilna (Sept. 18–23 1917) and, in negotiations which dragged until March 1918, petitioned the German Chancellor, Count Hertling, for the restoration of the country's independence under condition of a perpetual alliance between it and the German Empire (*Bundesverhältnis*). The German clerical party caused the "Taryba," or Council of State, which was then largely under the control of their army of occupation authorities, to offer the Lithuanian crown to Prince William of Urach, a younger member of the Württemberg reigning family. On July 11 1918 he accepted under the title of "Mindove II., King of Lithuania," choosing the style of a heathen prince of the 13th century who had fiercely resisted the Teutonic order. The German annexationists thwarted this candidature, which the Council of State eventually cancelled (Nov. 2 1918), but their delegates at the peace negotiations of Brest-Litovsk, in March 1918, upheld against Trotsky the authority of the Lithuanian Council of State. Their last argument rested upon this, that "Germany had recognised Lithuania's independence only on the condition that the conventions to be concluded among them the form of constitution and the choice of a ruler, shall correspond to German interests" (*Nordd. Allgem. Zeitung*, Aug. 1918). By the peace of Brest-Litovsk (March 3 1918), Germany forced Russia to abandon all claim on Lithuania.

---

[1] *Economic and financial situation of Lithuania* (Lithuanian State inting Office, 1925).

By Nov. 1918, the magnitude of Germany's defeat being no longer in doubt, the Taryba, or Council of State, promulgated a provisional constitution under which it became the Lithuanian Parliament. The supreme power was vested in three persons, A. Smetona, J. Staugaitis and St. Silingas, who on Nov. 5 1918 invited Prof. Voldemaras to form the first independent administration on non-party lines, and reach an understanding with the national minorities within the still indeterminate frontiers, viz.: White Russians, Poles, Jews and Great Russians. Alone the Pan-Polish party reverted irreconcilably to the historic solution of union or federation with Poland. The initial difficulties of setting up an administrative machine on national lines were the greater as the troops of the occupying Power were affected by the revolution which had broken out in Germany. Although Kovno itself was evacuated in June 1919 and shortly afterwards Southern and Eastern Lithuania, the area Mitau-Shavli-Taurage remained in German hands until Dec. 13. Upon their final withdrawal, the Germans allowed the Bolshevik troops to march into evacuated zones at a mean distance of 10 kilometres. This was in direct violation of the terms of the Armistice, concluded with the Entente Powers on Nov. 11 1918.

The Voldemaras administration resigned on Dec. 26 1918, the new Premier, M. Slezevicius, widening the Cabinet. Prof. Voldemaras, whom the precarious situation of the country and the approaching Peace Conference called to Paris, served as Foreign Minister, M. Yčas as Finance Minister, M. Velykis as Minister of War. In Jan. 1919 the near approach of the Bolsheviks to Wilno caused the removal of the Government to Kovno (Kaunas) where the Provisional National Assembly recognised the Council of State ("Taryba") and the Slezevicius Cabinet as the regular Government of Lithuania. The Taryba voted the provisional constitution, elected A. Smetona President of the State and composed the statute for the election of the Constituent Assembly, on the basis of proportional representation. National defence began to be organised. The Bolshevik advance reached its culminating point in May 1919 when Kovno itself was threatened. Until Sept. 1919 fighting took place against the Soviet forces, which were cleared out of the northern districts of the country, and until Dec. against the so-called Bermondt troops. Meanwhile, the Poles also had attacked the Bolsheviks and in April 1919 captured Vilna, establishing themselves there.

On Dec. 8 1919 the Supreme Council of the Allies in Paris laid down a provisional eastern frontier for Poland, the so-called "Curzon line," which assigned to Poland most territories where the Polish element was in a majority, but excluded mixed and doubtful districts, the principal among which was Vilna, city and province, which fell to Lithuania. The Polish Govt. proposed to the Lithuanian Govt. joint action against the Bolsheviks, but the latter refused pending Lithuania's recognition as an independent State with Wilno for its capital.

The consequence was that the Poles embarked upon large scale military operations against Soviet Russia single-handed. But although their invasion of the Ukraine, in April 1920, was successful, the Bolshevik counter-offensive, in July 1920, compelled the Poles to retreat almost to the confines of Warsaw. The Lithuanians took advantage of the situation and reoccupied Wilno (July 14 1920) which had had a Polish garrison at the time when the Curzon line was laid down. But shortly afterwards the approach of a Red Army caused the Lithuanians to evacuate in all haste, which action laid them open to the reproach that they were not able to hold what they had so long claimed as their patrimony. The Poles believed that they were fighting not only in defence of their own newly resurrected country, but that they were stemming the tide of the Red invasion which threatened to overflow into Central Europe. They accused the Lithuanians of surrendering an important strategic centre and an important railhead, with the consequence that the left flank of the hard-pressed Polish army was exposed. But, as it happened, the face of the war changed and the Poles, turning on their Bolshevik pursuers, defeated them and drove them back into Great Russia. Immediately the Lithuanians reoccupied Vilna (Aug. 24 1920) but came into conflict with the Poles there and at Suwałki.

Meanwhile the Lithuanian Constituent Assembly, or "Seim," composed of 112 members, met on May 15 1920. The Presiden of the State, the National Council and the Cabinet resigned and all power passing to the Seim, the provisional government gav way to the permanent government. The state of war with Soviet Russia had been concluded by a Peace Treaty signed a Moscow, on July 12 1920, under which the Lithuanian claim t Vilna and Grodno was recognised by the Bolsheviks, and Lithuania received 3,000,000 roubles in gold and 100,000 hectares o forest land for exploitation. A Polish protest to the League o Nations on Sept. 5 1920 was followed by an agreement betwee the Polish and Lithuanian governments to refrain from hostilities and to respect the limits laid down for them by an Allie Military Commission. A line of demarcation agreed upon a Suwałki on Oct. 7, to come into force on Oct. 10, again left Wiln on the Lithuanian side. But the *coup de main* of Oct. 9 by th Polish so-called "rebel" Gen. Zeligowski (*see* VILNA) place Vilna in Polish hands. On March 14 1923 the Allies recognise the *fait accompli*.

The Lithuanians were compelled to remove their capital t Kovno (Kaunas) where it has since remained, but the Vilna disput continued to embitter relations between the two Powers. Th Conference of Ambassadors, in a note of June 2 1924, invite the Lithuanian Govt. to enter into diplomatic and consula relations with the Polish Government. The Lithuanian Gov countered with a proposal that the Allied Powers shoul call a conference at which their representatives would meet Polish and Lithuanian delegates to reopen the territorial questio The Conference of Ambassadors replied in effect that the frontie question could not be reopened. The Memel (*q.v.*) questio proved to be almost as difficult of solution, but the Lithuanians imitating the conduct of the Poles at Vilna, seized Memel o Jan. 15 1923 by a *coup de main*. The Convention signed at Par on May 8 1924 laid down that the Memel (Klaipéda) territor constitutes an autonomous unit under Lithuanian sovereignty

The *de jure* independence of Lithuania was recognised by Ge many on March 23 1918, by Soviet Russia on July 12 1920 an by Latvia and Estonia in Feb. 1921, and by the Argentine Republic in March 1921. The long-drawn Vilna dispute delaye formal recognition by the Allies and the United States of Americ until the end of 1922. Lithuania became a member of th League of Nations on Sept. 22 1921.

Constitution.—Under the provisional constitution of June 1920, the then President of the Constituent Assembly, M. Stulginskis, acted as Temporary President, his acts being cou tersigned by the Premier. His election was subsequently co firmed by the Seim. The definite constitution of Aug. 1 1922 pr vides for a President, elected by the Seim, and for a Cabinet wi a Premier responsible to the Seim. The Seim consists of 78 deputies, elected by universal, direct, secret suffrage on the basis proportional representation, the electoral unit being of 50,00 inhabitants.

Internal Affairs.—In the constituent Assembly, the majori was formed by the Christian Peasant party, which in 1921 carried an agrarian reform bill for the twofold purpose of breakin up large estates and of reducing the influence of the Polish gent who owned many of the biggest properties. In 1922 the firs Lithuanian Seim was constituted, but the German, Jewish an Polish minorities abstained from taking part in the elections the ground that the Government had treated them unfairly. that year the revival of trade caused exports to exceed import by nearly 500,000,000 marks, but the inflationary period in Ge many made it imperative for Lithuania to adopt a currency her own. Accordingly, the gold standard was established an maintained, on the basis of a Lithuanian litai (the litai to be 1/ of a dollar). The exploitation of flax was made a State monopol

The necessity of getting an absolute majority caused the diss lution of the Seim in March 1923. The new elections showed th state of parties as follows: Christian Democrats 40, People Party 15, National Minorities 14, Social Democrats 9. As a result coalition between the two first named returned the Galvanauska Cabinet to power, which continued in office until June 192

Then the Christian Democratic party took over the administra-ion, M. A. Tumenas becoming Premier. Once again friction oc-curred with the minorities, especially with the Jews, who make up 4% of the population. But Tumenas prevailed, and the Minis-ry for Jewish Affairs was abolished.

Foreign Policy.—The feud with Poland caused Lithuania to tand aloof from all negotiations for a Baltic alliance. The re-ulting isolation was accentuated by misunderstandings with ther Powers. First and foremost among these was France, the riend of Poland, which at the time of the Lithuanian *coup de main* against Memel maintained a small garrison in that town. urther, the Agrarian reform bill affected the proprietary inter-sts of "national minorities," Polish, German, Latvian, etc., which endeavoured to secure diplomatic protection outside the imits of Lithuanian territory. Again, the closing of the Niemen, which was an economic measure designed to exert political pres-ure, invited commercial retaliation, while friction arose within he State itself between the purely Lithuanian clergy and the lergy of Polish extraction and education, which for a time itiated diplomatic relations with the Holy See. Finally, he circulation of the "Ostmark," which had been issued during he German occupation and was not redeemed, was resented by he people, the more so as the German Reichsmark was legal cur-ency until 1922, with the result that the Lithuanian State suf-ered heavily by its depreciation. These troubles were, however, some extent counterbalanced by happy relations with Soviet ussia which culminated in a treaty of non-aggression imposing trict neutrality on both parties in the event of a conflict between ither and a third State. This treaty (as yet unratified) was ne-otiated in April 1926 by Prof. Reinys, Lithuanian Foreign inister.

In 1922 Lithuania concluded a commercial treaty with Great ritain; in 1924, commercial treaties with Germany and Czecho-ovakia. On May 19 1924 she agreed at the Conference of Kovno enter into a tariff and customs union with Latvia and Es-nia; and these three States also agreed to pursue a concerted reign policy, especially in the Assembly of the League of ations.

(W. L. B.)

II. ECONOMIC AND FINANCIAL HISTORY

Lithuania is essentially an agricultural state. Of its total popu-tion (2,203,312 in 1923), nearly 80% live in the country. The ly large town is the capital Kaunas (Kovno), which had 92,446 habitants in 1923. The second town was Klaipeda (Memel) th 35,715 inhabitants; then came Panevezys (19,197), Siauliai havli) (21,387) and Ukmerge (10,604); the population of the ree last-named towns is, however, largely agricultural.

Education.—Thanks to the cultural conflict between the Rus-n Govt. and the Lithuanian people before the War, the olition of the monasteries at the end of the 19th century and Russianisation of elementary education, a large proportion of population is illiterate. According to the 1923 census 43·18% the men and 44·98% of the women could not read. Considerable orts were made by the Lithuanian Govt. to improve the ucational system of the country and the budgetary educational nts rose steadily from year to year. In 1924 there were over oo elementary and over 100 secondary schools. In Feb. 1922 a iversity was opened at Kaunas.

The economic organisation of the country on its present basis y be considered as beginning after the treaty of July 12 1920 h Russia; but progress was hampered by the protracted dis-tes over Memel (*q.v.*) and Vilna (*q.v.*).

Agriculture.—The estimated distribution of Lithuanian territory is as follows:—

	Hectares	% of Total area
Arable	2,595,000	46·2
Meadow and pasture	1,415,000	25·2
Orchards and gardens	169,000	3·
Woods and forests	909,000	16·2
Peat bogs	180,000	3·2
Uncultivated	349,000	6·2
	5,617,000	100·

The chief crops are rye, flax, oats and potatoes. The production of potatoes and rye would appear to have increased considerably since the War; but the returns are somewhat doubtful. The figures for 1924 and 1925 are given here.

	Area under Crops Hectares		Harvest (Quintals)	
	1924	1925	1924	1925
Rye	537,600	542,000	4,647,200	7,163,900
Wheat	84,900	112,000	903,200	1,461,000
Barley	196,000	205,000	2,028,600	2,562,500
Oats	325,000	345,000	2,697,500	3,415,500
Flax seed	61,500	76,000	338,300	458,400
Flax fibre			326,000	387,800
Potatoes	176,400	163,000	16,581,500	14,670,000

In spite of a recovery since 1920 the production per hectare of rye in 1923 was only 10·4 quintals, in 1924 8·6; wheat 9·9 and 10·6; barley 9·9 and 10·3. Efforts were, however, being made to improve agriculture with the help of the co-operative organisations. Experimental and model farms were started in different parts of the country, stations for cleansing grain set up and breeding stock imported. As in the other Baltic States co-operative societies play an important rôle. The most popular and numerous are, however, the consumers societies. Indeed, agricultural co-operatives for the marketing of goods only began to develop after the monetary reform at the end of 1922. Since the foundation of the so-called "Gamintojas" (Producer) or League of Agricultural Co-operatives early in 1923 with the object of organising the export of grain, flax, eggs, etc., and the import of fertilisers, implements and other agricultural requirements, the movement, assisted by the Government, made very considerable progress. In 1924 flax was the most important article of agricultural export, accounting for about 20% of the total value of all exports. Great hopes are, however, placed on the development of intensive dairy farming on Danish lines.

As under the Agrarian law (*see* LAND TENURE) no person may own more than 25 hectares of forest, nearly the whole of the forest area is exploited by the State; exclusive of the Memel district, 828,500 out of 872,000 hectares.

Timber.—In the 25 years preceding the War, however, very large districts were denuded of trees, and during the War the forests suffered heavily as a result both of deliberate destruction and of the abnormal demand for timber. It is officially estimated that about 2,200,000 cu. metres could be cut per annum without deforestating the country, granted adequate transport facilities. Timber and manufactured and semi-manufactured wood constitute the most important group of exports. From 1920 on the export of sawn timber made rapid progress as against that of unsawn timber, as shown by the following table:—

Amount in Cubic Metres (000's omitted)						
Principal articles	1920	1921	Jan.–Sept. 1922	Oct.–Dec. 1922	1923	1924
Wood: unmanufactured	317	244	226	19	44	48
Wood: manufactured	122	184	313	70	293	200

Industry.—No coal or mineral ore is mined in Lithuania, and such industries as exist are, therefore, mainly dependent upon agriculture. Industry suffered severely from the wars, and from subsequent political difficulties with Poland, the Memel problem, to some extent from the loss of the Russian market for metal manufactures and more recently from a banking and credit crisis. About half of the existing undertakings are occupied with the preparation of food products and beverages. The export of manufactured products is negligible.

Trade.—Owing to the system of valuation employed the trade statistics up to the end of 1922 probably somewhat exaggerated the magnitude of the imports. The total turnover has increased steadily from year to year.

Imports and Exports of Merchandise and of Bullion and Specie

Special Trade[1] Value in millions of litai						
Merchandise	1920	1921	1922	1923	1924	1925
Import . . .	72	95	75	157	207	253[2]
Export . . .	55	58	77	147	267	243
Balance[3]	−17	−37	+2	−10	+60	−10

[1] Imports for home consumption and exports of domestic produce.
[2] Provisional.
[3] Excluding the movement of bullion and specie.

The chief articles of export are: wood and wood products (about 25% of the total value of all exports in 1924), flax 20%, live stock 13%, eggs 7·5%, leather and hides 5·5%, and grain and flour 4%. In 1924 43% of Lithuania's total exports went to Germany and 28% to the United Kingdom. Of her imports, which are essentially miscellaneous in character, over 80% were derived from Germany in 1923 and about 63% in 1924.

Currency.—Since the autumn of 1922 Lithuania has had her own currency: the litai (one-tenth of a dollar). This unit of currency was adopted as, owing to the number of emigrants and the extent to which dollar notes sent from the U.S.A. had circulated in the country during the preceding years when the German Ost marks were depreciating in value, the population had become habituated to it. In connection with the monetary reform a central bank was established which has the sole right of note issue.

National Finance.—In 1923 the budget was balanced and from 1923–5 the proportion of total expenditure for military purposes and of total revenue derived from the felling of timber steadily diminished. The estimates for this period balanced at the following totals:—

	1923	1924	1925
Litai (in millions)	208·3	229·7	259·3

The actual receipts and expenditure in 1923 amounted to 176·9, and 171·8, and in 1924 to 241 and 232·3 million litai. On Jan. 1 1924 the total debt of the republic amounted to 72·8 million litai of which 2·6 million litai was domestic. Arrangements had been made with all creditor countries concerning the service of the foreign debt.

Communications.—The means of communication in Lithuania were constructed to meet the requirements of a province of the Russian Empire and are ill-adapted for present purposes. Thus Memel, which is the chief port for the whole country, can only be reached from Kaunas, either by an extremely circuitous route via Liaulian, Taurage and Papegiai, or over Latvian territory. For this reason the Lithuanian Govt. contemplated laying down two short lines linking Kaunas with Memel and giving northern Lithuania a direct outlet at Memel to the sea via Pelsiai. The length of the railways in 1925 was 1,138 km. large gauge, and 454 km. narrow gauge under State control, plus 48 km. of line under private management and the Highways Board and some 110 km. of private lines in Memel.

The Niemen, however, forms an important natural highway, being navigable for 419 km. and utilisable for the floating of logs for a much greater distance. The rivers Necys and Nevežys are likewise navigable for 20–30 kilometres. But these rivers are all frozen in winter when the transport of timber from the forests to the nearest clearing station is accomplished.

Bibliography.—E. T. Harrison, *Lithuania Past and Present* (1922); P. Klimas, *Le développement de l'Etat Lithuanien* (1919); Census returns, trade statistics, national budgets, *Statistical Journal* and other official Lithuanian documents. (A. Ly.)

LITTLE ENTENTE.—The Little Entente is a political organisation, created after the World War, which binds together three Central European States, Czechoslovakia, Yugoslavia and Rumania, for purposes of their common interest.

Origins under the Dual Monarchy.—Those nations had in the past been throttled by the Germanising and Magyarising system of the old Austria-Hungary; one of the objects of the Little Entente is to defend the freedom they won after the War against all attempts to restore the former régime. The Little Entente had its roots in a series of political acts and declarations dating back to the days of the old monarchy. In the Austrian half of the Habsburg Empire the representatives of the small nations in the Parliament at Vienna joined in opposition to the centralising system which opposed the non-German peoples. In the Hungarian half the oppressed Slovaks, Serbs, Croats and Rumanians met in 1848 and made a protest against Magyar imperialism; they did so again in 1895 at Budapest; and in 1905 10 non-Magyar deputies of the Budapest Parliament formed a club for a like purpose.

During the World War, when the Austro-Hungarian peoples revolted and helped the Western Entente to break the system of militarist imperialism, a common aim again produced comm action. In April 1918 a congress of the oppressed Austro-Hu garian peoples was held at Rome, and in the autumn of that ye the Central European Democratic Union was formed in Americ A year earlier a great meeting of representatives of the Austr Hungarian nations had taken place at Kiev in Russia and ha established a special committee to fight against German an Austro-Hungarian imperialism. A prominent place was taken all these actions by the Czechoslovaks, Yugoslavs and Rum nians, supported by Poles, by the Italians of " Italia irridenta and finally by Ukrainians. The co-operation of the first thr nations was particularly close, and toward the end of the W they undertook diplomatic action in common. The Little E tente was formed soon after the Peace treaties had been signe when attempts began to be made by various elements of the pr War régime to bring about a restoration of the Habsburg dynast

The Formation of the Little Entente.—The Czechoslovaks, Y goslavs and Rumanians knew that a return of the Habsbur would mean the restoration of the German-Magyar absolutis and the destruction of the freedom won by the political revol tion of 1918. The Habsburg intrigues were chiefly engineered Hungary, where the new régime in Central Europe was last to recognised and where intense propaganda was conducted for t recapture of the Slovak, Serbo-Croat and Rumanian territor The Habsburg menace led to corresponding defensive measur on the part of the threatened States. The Czechoslovak Forei Minister travelled on Aug. 13 1920 to Belgrade, where, on the f lowing day, a defence treaty, of which the broad outlines had ready been negotiated, was concluded between the kingdom the Serbs, Croats and Slovenes and the Czechoslovak Republ binding both States, in case of an unprovoked attack by Hu gary on either of them, to provide mutual aid the one to the othe and to refrain from making any alliance with a third Power wit out the consent of both. At Bucharest, whither the Czechoslov Foreign Minister proceeded from Belgrade, the basis was neg tiated on Sept. 17 for an analogous entente.

After all the questions of detail had been settled, that agre ment also was given the form of a defensive treaty, and conclud on April 23 1921. On Sept. 19 1920 Rumania informed bo those States that she recognised a similar obligation. She co cluded special treaties to that effect with Czechoslovakia April 23 1921, and with Yugoslavia in June of that year. T opportuneness of that defensive alliance was proved in April a in Oct. 1921, when two attempts were made to restore the Hab burgs. Those attempts failed only because they met with t combined armed resistance of Czechoslovakia, Yugoslavia a Rumania.

The European Side of the Little Entente.—The three Stat forming the Little Entente were aware from the beginning th mere defence measures would not suffice for the maintenance the new régime if the States concerned were themselves lacki in creative forces, or failed to attain the greatest possible deg of political and economic solidarity and an atmosphere of mut trust and fruitful co-operation throughout the whole area of C tral Europe. The ultimate and wider aim of the Little Entente therefore to educate Central Europe as to the advantages of u versal peace and European consolidation. The progress made the realisation of this policy is best seen in the political and e nomic spheres. The main political object was to persuade all t Central European States to work in peaceful co-operation with t new States, and much success has been achieved. Starting from t Treaty of Rapallo between Yugoslavia and Italy and the agr ments worked out on the occasion of the visit of the Czechos vak Foreign Minister to Rome in Jan. 1921, that policy b fruit in the Czechoslovak-Austrian agreement of Dec. 16 19 which bound both States to abandon hostile propaganda and settle all disputes by peaceful arbitration. The same princip were the basis of the Czechoslovak-Polish treaty of Nov. 6 19 which, although not ratified, created better relations between t two States, and, being followed by the Polish-Rumanian politi treaty, materially improved the relations of Poland with t Little Entente as a whole.

In the measures taken to save Austria from financial ruin Czechoslovakia had a large share, and did not hesitate to make sacrifices in the interests of mutual confidence. A like policy was ollowed by the Little Entente towards Hungary, despite the fact that it had been the nationalist elements of Hungary and heir Habsburg sympathies that had brought the defensive aliance of the Little Entente into existence. The latter knew from he beginning that correct and, as far as possible, friendly relaions between it and Hungary were essential to the complete pacification and consolidation of Central Europe. The States forming the Little Entente showed the best of good will in this espect, as is proved by the frequently repeated attempts of Czechoslovakia to negotiate with the Hungarian Govt. from as early a date as 1921. If those attempts were unsuccessful, t was because Hungary sought by an adventurous policy to avoid an understanding with her neighbours. The recent hange in this respect, clearly due to the failure of that Hungarian policy, is nowhere more welcomed than in the countries of the Little Entente, whose only wish is that the change be permanent, so that a new Hungary, consolidated both econonically and politically, may co-operate in the reconstruction of Central Europe.

Economic Policy.—The economic policy of the Little Entente tarts from the conviction that in Central Europe it is necessary not only to overcome the harmful results of the depreciated curency, the obstacles to trade connections and the disturbances in he industrial world, but also to make up for the consequences of he disintegration of the old monarchy, which had constituted an conomic whole. The basis of its economic policy, therefore, is he minimising of these results by the earliest possible establishment of commercial relations with each other and with the rest f the world. The political negotiations have therefore always been combined with economic negotiations, which have been the basis of a series of commercial treaties, at first between the States of the Little Entente and then with all the neighbouring ountries. Questions of common interest to all the States spring-ng from the former Austria-Hungary have been discussed with ood results at special conferences, *e.g.*, those at Rome and Porto-oso in 1921, and, later, the special conferences dealing with passport, transport and other problems. The results of this eco-omic co-operation have not of course been equally satisfactory in ach of the States concerned, nor have they been enough in them-elves to restore healthy conditions to those States whose eco-omic, financial and currency difficulties left them with no alter-ative to calling in international financial help.

Expansion of the System.—The increased activity and the de-ermined policy of the States forming the Little Entente have utgrown the limits of the simple defence treaties which consti-uted the original basis. On Aug. 31 1922 that formal basis was considerably enlarged by the conclusion of a new treaty, in the second article of which both Czechoslovakia and Yugoslavia recognised the treaties concluded by Czechoslovakia with Rumania, Austria and Poland on the one hand, and by Yugoslavia ith Rumania and Italy on the other. In the third article both arties agreed to put their economic, financial and transport re-tions on a firm basis by co-operation; and finally in a further ar-cle they undertook to support one another in their international political and diplomatic relations and to take common measures their common interests should be threatened.

The principles incorporated in that treaty reveal both the spirit nderlying the Little Entente and the basis of its future activity. mphasis is laid on the importance of economic co-operation and solidarity in international affairs; the periodical renewal and xtension of the existing system of commercial treaties, together ith the ever increasing moral weight of the Little Entente in the ouncils of Europe, prove that the statesmen of the Little En-nte have a firm grasp of both political and economic realities. t international conferences, such as those of the League of Na-ons, the representatives of the Little Entente have regularly poken as one man, and have therefore contributed to a considerable simplification of international relations; their behaviour is articularly noteworthy in that it is not only of a united but of a pacifist character. The future aim of the Little Entente will be still further to promote the pacification and the consolidation of Central Europe. *See* also CZECHOSLOVAKIA; EUROPE; RUMANIA; YUGOSLAVIA, etc. (E. BE.)

LITVINOV, MAXIM MAXIMOVICH (1876–), Russian politician, was born at Bielostok. When only 17 he entered military service as a volunteer and while in the army became interested in Marxism. When his term of service was completed, he devoted himself to propaganda, and became a member of the Kiev committee of the Social Democratic party. The president of that committee proved to be a police agent and the whole committee was arrested. After a year and a half in prison Litvinov with 11 companions escaped from gaol, went abroad and took an active part in the *Iskra*, the Social Democratic newspaper. When the split in the Social Democratic party occurred, Litvinov joined the Bolsheviks, or majority section, returned to Russia illegally in 1903 and worked there as a member of the central committee until the revolution of 1905. In that year he attended the London Congress as a delegate from the Riga Committee and took part with Gorky in founding *Novaya Zhizn* (*The New Life*), the first legal Social Democratic newspaper to appear within the boundaries of Russia.

During the succeeding years of reaction, Litvinov lived abroad, where he organised the sending of weapons to the revolutionaries in the Caucasus. He took part in the International Socialist Bureau which he left at the beginning of the World War after protesting against the entry of Socialists into bourgeois governments and in general against Socialist support of the War. After the November revolution (1917) in Russia he was appointed diplomatic agent of the Soviet Government in England. He was subsequently arrested as a hostage for Mr. Lockhart, for whom he was exchanged. He afterwards became one of the most important figures in the Soviet diplomatic service, as assistant commissar for foreign affairs taking part in the initiation of peace negotiations with Estonia, in negotiations at Copenhagen with England, in the Genoa conference and, as president of the Russian delegation, in the subsequent conference at The Hague. In 1925 he became a member of the Revolutionary military council of the Union and later chief-of-staff of the Red Army.

LIVERPOOL, England (*see* 16.804).—The population of Liverpool increased from 753,353 in 1911 to 802,940 in 1921. The municipal area was enlarged in 1913 by the inclusion of Allerton, Childwall, Little Woolton and Much Woolton to a total area (exclusive of 2,883 ac. of river bed) of 21,242 acres. The death-rate per 1,000 fell to 13·6 in 1924. The policy of slum clearance and the erection of large numbers of cottages followed by the council, which was begun before the War, has had beneficial results. Over 6,000 houses had been built by 1924 under municipal housing schemes on large estates at Larkhill, Allerton and elsewhere, and 460 ac. were acquired in 1925 for a further big scheme at Norris Green, just outside the city boundaries. Garston has become an important shipping and coal export centre. Since 1918 the borough has returned 11 members to Parliament.

Public Utilities, etc.—The total area of parks and open spaces is 1,396 ac., including the Harthill estate of 32½ ac. (1913), the Walton Hall estate of 130½ ac. (1913), the Woolton Wood estate of 62 ac. (1917) and the Allerton and Allerton Towers estates of 228 ac. (1924). Among important buildings erected since 1910 are the prominent Royal Liver and Cunard buildings, near the landing stage; an art gallery at Port Sunlight, erected in memory of Lady Leverhulme; and the Midland Adelphi Hotel. Recent monuments include a bronze statue of King Edward VII. in front of the Cunard buildings; one to the engine room heroes, erected by international subscription in 1916, overlooking Prince's landing stage; one to Sir A. L. Jones at the George pierhead; and the Cunard company's War memorial column. The proposed Liverpool War memorial is a cenotaph in front of St. George's Hall, in addition to the Cathedral War memorial, which is a cenotaph and includes the Roll of Honour. A holiday home for orphans was opened in 1924 as a memorial gift from the churches of the city.

A Merseyside municipal co-ordination committee was formed in 1922, with the object of improving local communications, particularly across the river. Negotiations for financial assistance from the Government were successful in 1924, and in Dec. 1925 the boring of the Mersey tunnel, which, it is hoped, will provide a solution of the very difficult traffic problem, was begun by the sinking of a shaft on the site of the old George's dock. When completed, the tunnel, 44 ft. across, will contain a roadway for heavy traffic 36 ft. wide, with footways on each side, and beneath one for lighter vehicles. There will be two approaches on the Liverpool side, one for heavy traffic at New Quay and one for lighter at Whitechapel. On the Birkenhead side there will be one approach, near the Woodside Hotel. The urgent need of an additional water supply led to plans for the construction of a third pipe-line from Lake Vyrnwy (to be followed by a fourth), and the crossing of the Mersey is to be effected by laying pipes in the river bed. Work was begun in 1925.

Cathedral.—The work of building the cathedral, practically stopped during the War, was resumed in 1920. Owing to the exigencies of the site on St. James' Mount the building lies north and south, the rubrical "east" thus pointing south. The general plan, which is marked by strong individuality of style, consists of a great central space (200 by 72 ft.) formed beneath a central tower by the crossings of two pairs of transepts, a choir in three bays and a nave—the whole to have an interior length of 480 feet. The principal portal of the cathedral will be at the west side of the tower, not at the traditional west end. The stone is Woolton red sandstone, which weathers to a greyish pink in a smoky atmosphere. The first section, which includes the Lady Chapel, was consecrated in 1910 and the choir, two transepts, and the chapter house were consecrated in July 1924. In the southeast transept is a memorial to the 55th division, and in the War memorial northeast transept there is a cenotaph. The building is heated by the hypocaust system. Work on the great central space and the west transept was begun in 1925. (*See* ARCHITECTURE.)

Markets.—A market was established at Garston in 1920, and in 1922 a general market was set up on the site of the wholesale vegetable market in order to do away with the holding of unauthorised markets on waste ground. In the same year the frozen meat market was acquired, as a preliminary to the building of abattoirs and a meat market on the site of the Stanley cattle market.

Port Improvement Schemes.—Large schemes for the improvement of the port have been in process of execution by the Mersey Docks and Harbour Board since 1906. They include the construction of a great vestibule dock, 1,070 ft. long and 130 ft. wide, with a river lock entrance and two branch docks, at the north end of the dock estate. A lock 645 ft. long and 90 ft. wide, opened in 1921, connects the new dock with the adjacent Hornby dock. These new docks will add 2¾ m. of quays to the port, and will be, it is said, the largest and best equipped in the world. Work was suspended during the War, but was afterwards pressed forward. Large extensions have been made to the electric equipment of the port, the landing stages enlarged to provide further facilities for the embarkation of passengers, and a wireless telephone installed from the Bar Lightship to the Harbour Board offices. About one-third of the total overseas trade of Great Britain passes through Liverpool, but since the War Liverpool has given place to London as the first port for wheat imports. To provide accommodation for the growing oil industry a large area of land, known as the Parkhill and Dingle estate, has been set apart at the extreme south end of the dock estate for the erection of oil tanks, with pipe-lines to berths in the Herculaneum dock. (O. J. R. H.)

LIVERPOOL, UNIVERSITY OF (*see* 10.43).—New chairs have been founded in classical archaeology, geography, commerce, civic design, social science, applied mathematics, organic chemistry, industrial chemistry (fats and oils), bacteriology, geology, oceanography, entomology, parasitology, tropical diseases of Africa, dental surgery, veterinary anatomy, care of animals (causation and prevention of disease), international law, engineering, electrical machinery, applied mechanics, civil engineering, metallurgy and naval architecture. New fellowships have been created for modern history, English literature, Celtic chemistry, anatomy, orthopaedic surgery, engineering. A number of scholarships have been instituted, in architecture, travelling, research (offered in the faculties of arts, science and engineering in rotation), chemistry, marine biology, medical subjects, engineering and law.

New buildings were erected for arts building extension, Students' Union and Gilmour Hall, engineering building extension, school of tropical medicine, chemistry school extension, department of geology, hall of residence for women extension, dental school extension, athletic pavilion, laboratory for research in tropical diseases (Sierra Leone). Residential buildings have been altered and equipped for accommodating the departments of education, geography, school veterinary surgery, metallurgy, school of social science, hostels for men, institute of archaeology. New departments have been instituted in civic design and town planning, poetry, music, art of the theatre, medieval history, analysis of observations, geology, cytology, pharmacology, radiology and electrology, orthopaedic surgery, parasitology, chemical physiology, public health chemistry and refrigeration. New degrees have been ordered for commerce, architecture, hygiene, orthopaedic surgery, veterinary science and philosophy, while diplomas have been instituted in radiology and electrology, tropical hygiene, archaeology, geography and social studies. In 1919 a tidal institute was established by the university in association with local shipowners. In connection with the department of oceanography, founded in 1919, a sea fisheries laboratory is maintained at Port Erin. Extensive researches are carried on in the local sea fisheries in regard to diseases of fish and kindred subjects.

Extramural Work.—The university extension board extended its influence to the Isle of Man, to Crewe in the south and to Blackpool and Carlisle in the north, at 23 centres, in co-operation with local committees and organising bodies. Christmas lectures for boys and girls have been inaugurated. A scholarship open to extramural students provides the holder with the means of proceeding to a degree course in the university. Free public lectures have become a feature in university life at Liverpool. Courses of lectures and single lectures are given almost nightly in the winter, in many subjects taught in the university.

Industrial Relations.—For some years advisory boards have been established in commerce and in science and engineering subjects, including representatives of commercial and industrial firms. The university has adopted special regulations for the proper conduct of what is termed "outside work." Facilities are offered by a large number of firms permitting students to visit works and examine processes, etc. Much is done in finding suitable posts for graduates on leaving the university.

Numbers of Students.—The following table shows the increase of students in 1924–5 as compared with the entries for 1910–11:—

1910 -1			1924–5		
Full time	Part time	Total	Full time	Part time	Total
919	279	1,198	1,651	400	2,051

The University in Wartime.—During the War the resources of the university (particularly of the science, engineering and medical departments) were devoted to national service, and accommodation in the university buildings was found for many Government departments. Research work was undertaken for the Government in chemistry (dyeing, edible oils, high explosives, etc.), insect pests, mathematics (Admiralty work and guns), optical instruments, engineering and medical science (particularly in tropical diseases, bacteriology, pathology, orthopaedic surgery and dentistry). The engineering staff organised classes for the manufacture of shells, and the staff and students made over 1,500 gauges. The inspection of high explosives for the Liverpool area was centred in the chemical laboratories, and over 250,000 tons of high explosives were passed there. Mem-rs of the university who served in the War (staff, students d servants) numbered 1,673 of whom 197 were killed in action died on service, and five gained the Victoria Cross (one th bar).

LLANDAFF, HENRY MATTHEWS, 1st Viscount (1826–1913), ritish politician, died in London April 3 1913.

LLOYD OF DOLOBRAN, GEORGE AMBROSE LLOYD, 1st aron (1879–), British administrator, was born on Sept. 1879, the son of Sampson Samuel Lloyd of Dolobran, Mont-meryshire, and was educated at Eton and Cambridge. He ecame a close student of politics and travelled widely in Burma, dia, Little Tibet, the Himalayas, Egypt, Morocco and Asia inor. In 1905 he was appointed attaché to the British Em-ssy at Constantinople, and in 1908 acted as special commis-ner for the British Govt. to inquire into and report upon the ture of British trade in Turkey, Mesopotamia and the Persian ulf. During the World War he saw service in Egypt, Gallipoli, ussia, Mesopotamia and with the sheriff of Mecca's forces in e Hejāz, gaining the D.S.O. in 1917. He was Conservative .P. for West Staffordshire from 1910 until 1918, when he was pointed governor of Bombay, a post which he held until 1923. e was created G.C.I.E. in 1918 and G.C.S.I. in 1924 when he as again returned to Parliament as M.P. for Eastbourne. In ay 1925 he was appointed high commissioner for Egypt, and Oct. was raised to the peerage.

LOCARNO, PACT OF.—Locarno is a fact of European signifince. If, therefore, we wish to treat of the particular outlook one nation or another it cannot be in relation to the great jectives shared by all, towards which the policy of Locarno as directed. The German people, indeed, have expressed their inion of the actual documents in which the results of Locarno e enshrined, in less unanimous terms than other nations, but may be said that in the overwhelming majority they are as nvinced as any nation of the desirability of those great aims.

It was not altogether easy to make it clear to German public inion that the problem of security was fundamental to any actical approach to these ends. The man in the street, seeing e harbours empty, the barracks deserted, the armament indus-es destroyed and the richest areas of his country overrun by reign troops, found it hard to understand that it was not his n security but that of his armed neighbours, old and new, at stood in need of a guarantee. The difficulties would, there-re, have been excessive had not Great Britain stepped in at rmany's suggestion and declared herself ready to throw the hole weight of her power into the scale in the defence of Ger-ny's western frontier, no less than eastern frontiers of France d Belgium.

It is too much to say that Great Britain's intervention, neficent as it was, amounted to a solution in itself. The path hich it opened was still encumbered by many obstacles. The ncerity of the German proposal was not everywhere realised th the same clear-sightedness shown by the British statesmen. rmany was credited with designing to secure a British guar-tee on the Rhine to enable her to effect a forcible rectification certain frontiers in the east which were not in harmony with cial justice and sound economics. It was feared, moreover, at a separate pact between the Great Powers interested in the hine would overshadow a pact concluded within the framework the League of Nations and undermine the prestige of the ague itself. It was by no means easy to remove the first urce of anxiety, despite Germany's sincere wish to develop r relations in the east along peaceful lines, since France, as land's military ally, could not be seriously regarded as an partial guarantor of German-Polish relations. The second ound of apprehension would, it seemed, vanish when Germany tered the League of Nations. She was, however, compelled demand that she should enter as a completely equal partner. was therefore necessary that consideration of the inequalities armament be secured beforehand.

An unusual measure of goodwill on the part of all concerned s needed to overcome these and other difficulties. Happily e hour of Locarno was favourable and the statesmen assembled there actually incorporated this goodwill in a high degree. Personal contact strengthened in each that determination to conquer the spirit of mistrust, which in such circumstances is the sole warrant of success. Accordingly, there was little delay in drawing up the documents which were signed in London on Dec. 1.

From the German point of view their immediate significance is clear and simple:—

1. They set Europe free from the nightmare of warlike complications in one of the danger-points of the Continent.
2. They substitute a system of objective legal procedure and amicable arrangement for high-handed militarism and the one-sided interpretation of treaties.
3. They pave the way for Germany's co-operation in the League of Nations, by ensuring that she shall not be involved against her will in conflicts for which she is unfitted by her geographical position and her military situation.

Even if it had no other than this immediate significance, the Pact of Locarno would be one of the most important documents of 20th century history. But it was recognised with a rare unanimity and, further, was emphatically laid down in the protocol of Locarno that its full import entailed further consequences. Everything in fact in this complex of treaties has a bearing upon the future.

The legal disputes, often of a very subtle order, which in recent years have stirred passions to a frenzy, will in future be referred to the calm atmosphere of international courts of equity, so that our generation may acquire a clear outlook, enabling it to co-operate in mutual confidence in the political, economic and cultural reconstruction of Europe. There is hardly any aspect of this infinitely complicated problem which will not sooner or later be made to feel the beneficial influence of this clarifying process. The particular problem, however, which will be most immediately and decisively affected is undoubtedly that of universal disarmament. Germany's practical interest in this issue is less than that of other countries. For the chief financial relief will be enjoyed by those countries which disarm, while the diminution of the military burden will benefit the Powers competing with them in armaments. For Germany, on the other hand, the effect is primarily a moral one in three ways.

Firstly, because disarmament will mean the beginning of the long-delayed fulfilment of a solemn promise, confidence in which brought the German people to lay down its arms; a promise which was solemnly reaffirmed to it in Versailles.

Secondly, because in the words of the distinguished statesman who represented Belgium at Locarno it is impossible "to keep a rich and powerful people disarmed by duress and in a one-sided way for an indefinite period, while its former enemies in Europe remain armed to the teeth."

Thirdly, because this is the best way of convincing the German people that the pledges which Germany has offered of her own free will, and under the guarantees of Great Britain and Italy, for the security of her Western neighbours, are appreciated at their full value by the latter. How could the German people be asked to believe in the security pact if the signatory Powers most immediately concerned continue to base their security exclusively upon heavy artillery, tanks and aerial bombs?

Regarded in this light, it becomes intelligible why public opinion in Germany more than anywhere else looks so eagerly for the realisation of what in Locarno was so justly styled the "logical outcome." Every recognition is due to the fact that the responsible statesmen on their return to the turmoil of their capitals from the calm and reflective atmosphere of Locarno have honourably striven without waste of time to bring about the realisation of a part of that "logical outcome." It must alike be recognised that before the full programme can be realised, time is necessary to prepare public opinion in each country. The document of Locarno is no prescription, merely needing the physician's signature, to allay the fever of mistrust. But in the last resort the prescription of Locarno will have to prove its efficacy by one fact alone: that no State shall ever again hold it necessary or even compatible with the Treaty to seek for the guarantees of its security by accumulating the machinery of violence on the territory of its neighbour. When that hour strikes, even those sections of German opinion, which are still skeptical of Europe's miraculous healing from the spirit of destructiveness, will no longer be able to stand aside. Then will the whole German people engage its ambition in being outdistanced by none in peaceful co-operation for the welfare of Europe. (*See* SECURITY.) (G. ST.)

LOCKJAW: *see* TETANUS.

LOCKOUTS: *see* STRIKES AND LOCKOUTS.

LOCKROY, EDOUARD (1838–1913), French politician (*see* 16.854), died Nov. 22 1913.

LOCKWOOD, WILTON (1861–1914), American painter (*see* 16.855), died at Brookline, Mass., March 20 1914. In 1912 he was elected a member of the National Academy of Design.

LOCKYER, SIR JOSEPH NORMAN (1836–1920), British astronomer (*see* 16.855), died at Sidmouth, Devonshire, Aug. 16 1920. In 1912 he became president of the British Science Guild.

LOCOMOTIVE: *see* RAILWAYS.

LÓCZY, LÁJOS DE LÓCZ (1849–1920), Hungarian geologist, was born at Pressburg (Bratislava) Nov. 2 1849. He studied at the Zurich Polytechnic, obtaining his engineer's diploma in 1874, and from 1877–80 travelled through India and China as geologist to the expedition of Count Bela Szechenyi. In 1886 he became professor of geology at the University of Budapest, and in 1908 director of the Hungarian Geological Institute. He completed geological researches in China, in Hungary and, during the World War, in Serbia. His principal work, *The Scientific Results of the Expedition of Count Bela Szechenyi to Eastern Asia* (1890), comprises the first scientific description of the mountains which connect the Kuen Lun chains with the North-east Indian chains behind the red basin of Szechwan. His researches concerning the steppe-formations of the Gobi and the northern Hwang Ho territory are also of great importance. His other important work, *The Results of the Scientific Research of the Balaton*, forms a great monograph of the Hungarian lake, in which the formations of the Balaton region are explained. His posthumous works are: *The New Geological Map of (pre-War) Hungary*, and *Geology of West-Serbia*, which revolutionised the geological knowledge of Serbia. He died at Balatonaracs May 13 1920.

LODER, BERNARD CORNELIUS JOHANNES (1849–), Dutch jurist. From 1873 to 1908 Loder practised as a lawyer in Rotterdam and from 1908 to 1921 was a judge of the high court of justice of the Netherlands. In 1905, 1909, 1910 and 1922 he represented the Netherlands at the diplomatic Sea Conferences at Brussels. He presided at the conference of the Scandinavian kingdoms, Switzerland and Holland, held in 1920. The Permanent Court of International Justice at The Hague appointed him its first president in 1922 and he retained this position until early in 1925.

LODGE, HENRY CABOT (1850–1924), American statesman and author (*see* 16.860), in view of his continuous service in the Senate since 1893 was recognised during the closing years of the Roosevelt administration and under Taft as one of the Republican leaders. This position he maintained at the time of the Republican-Progressive split which led to the election of Woodrow Wilson in 1912; his personal friendship with Roosevelt remained unbroken, but he held true to his long-established principles of party regularity. He was well equipped for leadership in opposition, for his talents were critical rather than constructive and he possessed the qualifications of a great parliamentary debater. His prime interest lay in foreign affairs and it was as a member of the Senate Foreign Relations Committee and later as opponent of President Wilson that he exercised his chief interest. This opposition was originally in no way personal, as has been frequently suggested.

In 1914 Lodge supported Wilson's demand for the repeal of the Panama Tolls exemption on the ground that the President had a right to expect such assistance as would enable him to conduct foreign affairs effectively; "the great responsibility," said Lodge "of initiating and shaping our foreign policy must rest with the Executive and cannot rest anywhere else." He lost confidence in Wilson, however, as a result of the President's handling of the Mexican problem in 1914, and thereafter becan one of his principal critics. He regarded him as a man of wor with no capacity for well-considered action: "I wonder if t future historian will find him out," he wrote in his diary. Th distrust increased after the outbreak of the World War. Lodge intense nationalism, which in the past had given him the reputa tion of being an Anglophobe, led him to protest strongly again the failure to protect American lives and property, wheth destroyed by Mexican revolutionaries or by German submarine He successfully opposed the Shipping Bill in Jan. 1915, oster sibly on the ground that it would lead to foreign complication chiefly, however, because he feared it would result in the pu chase of the German ships in American harbours, an act whic he regarded as unneutral and unfriendly to the Entente. H desired the United States to enter the War against German after the sinking of the "Lusitania," and warmly objected t every suggestion of placing an embargo upon the export American munitions, which he looked upon as a pro-Germa manoeuvre. He steadily opposed Wilson's Caribbean polic in Feb. 1914 he refused to support the treaty negotiated wit Colombia providing for the payment of $25,000,000 and expres ing regret for incidents connected with the United States reco nition of the independence of Panama and the acquisition of th Canal Zone; in Jan. 1916 he offered a resolution calling f armed intervention in Mexico. He advocated enthusiasticall a larger army and navy.

With the entrance of the United States into the War, Lodg called for non-partisan support of the President in all policie that might increase the War effort of the United States and i assistance to the Entente Allies, and he helped to carry throug many of the Administration's War measures, although he op posed one of the most important designed to organise wa making agencies, the Overman Act, on the ground that it gav unlimited power to the Executive. Wilson's peace policie Lodge neither understood nor approved. In 1915 and 1916 h had himself advocated a League of Nations and the principle compulsory arbitration, but he later confessed that he change his mind and saw in Wilson's proposals more danger tha advantage. In Aug. 1918 Lodge was elected Republican Floo Leader of the Senate, and as a result of the autumn election which gave control to the Republicans he became chairman the Senate Foreign Relations Committee. At the moment the opening of the Peace Conference he was thus titular an actual leader of the opposition to Wilsonian peace policies, post for which he was fitted by his convictions as well as h ability.

On Dec. 21 1918 Senator Lodge inaugurated what develope into a successful campaign against the Wilson peace plan by speech in the Senate in which he insisted upon the need of separating the League from the treaty. Under his guidance and tha of Senator Knox, both men of long experience in matters foreign policy, the Senatorial opposition to Wilson develope rapidly; it was not broken by Wilson's conference with th committee on Feb. 26 1919. "The President," recorded Lodge "answered questions for two hours about the draft of the constitution of the League of Nations, and told us nothing." O March 4, Lodge with 38 Republican Senators issued a declaration expressing disapproval of the Covenant in its existing for and its inclusion in the treaty of peace. Thus when Wilso finally returned from Paris in July 1919 he found a well-organised opposition to the Covenant, which capitalised the increasing protest against the President's alleged autocracy of metho and the dissatisfaction with various aspects of the Versaille Treaty, together with the discontent inevitably arising fron after-War conditions and directed against the party in power.

Lodge did not hope to defeat the treaty by a straight vote disapproval; the popular demand for peace was too compellin He did hope to attach a number of amendments or reservation which would attract the support of the die-hard enemies Wilson and the Covenant, and which would protect the "interests and safety of the United States." This policy he carrie through successfully, aided by the President's illness and hi

usal to consider any compromise. On Sept. 10 1919 Lodge
esented the report of the committee to the Senate, which
ally adopted 15 reservations to the treaty. When, on Nov.
., the treaty with these reservations was voted upon, 42 Demo-
its, of whom nearly all approved the Covenant and treaty
t objected to the reservations, voted against it. It was
cordingly defeated, 39–55. A motion for ratification without
ervations was lost, 38–53. Efforts to secure a compromise
lowed but proved unsuccessful. Wilson refused to accept the
dge reservations, and Lodge was able to hold his group firm
refusing to pass the treaty without reservations. His tactical
ccess was unquestionable when on Mar. 19 1920 the treaty,
ich had been reintroduced, failed to secure the necessary two-
irds vote of the Senate by seven votes, for it was lost through
e votes of Democratic Senators who voted against it at the
sh of the President. Senator Lodge himself was doubtless
cere in his willingness that the treaty should pass, with his
ervations attached, but he later expressed relief that it had
led; writing only a month before his death he seemed con-
ced that "the League cannot do anything to stop wars."

As the successful leader of the opposition to Wilson, Lodge's
estige was increased and his influence in the succeeding ad-
nistration was for a time great. He served as permanent
airman of the Republican National Convention in 1920, and
one of the four U.S. delegates at the Washington Conference
the Limitation of Armaments in 1921. Thereafter his in-
ence waned to some extent, especially after he opposed
rding's proposal for joining the World Court. He was re-
cted to the Senate in 1922 by a narrow margin; under Cool-
ge, although leader of the Senate, he did not work in close
-operation with the President. He died at Nahant, Mass., on
v. 9 1924 at the age of 74.

Senator Lodge was one of the great Congressional figures of
e last decade of the 19th and the first two decades of the 20th
nturies. Reputed cold and distant in manner, a "Boston
ahmin," he enjoyed the prestige indicated by his popular
pellation, the "scholar in politics," and held the respect of his
leagues on both sides of the Senate, who admired his ability
a debater, his tactical skill upon the floor, and the knowledge
d experience which he brought to prolonged and assiduous
our in committee. An historical writer of high reputation and
ductivity, fate denied him the opportunity to become re-
nsible for great legislative measures and forced him at the
ex of his career into the rôle of critic. (C. SEY.)

ODGE, SIR OLIVER JOSEPH (1851–), British scientist,
e 16.860). After 1910 Sir Oliver Lodge became increasingly
minent as a leader of psychical research and a strong believer
the possibility of communicating with the dead, and he dis-
guished himself more than any scientist of his time in the
ious endeavour to reconcile science and religion. Among his
blications dealing with this subject are *The Survival of Man*
09); *Reason and Belief*, 3rd ed. (1911); *The War and After*
15); *Raymond, or Life and Death* (1916), a memoir of his son
ed in the World War, with an account of communications
ieved to have been received from him since; *Christopher: a
dy in Human Personality* (1918). Early in 1920 he made an
ensive lecturing tour of the United States, having just pre-
usly retired from his post as principal of Birmingham University;
d a few years later he published a series of popular scientific
ks of which the best known are *The Making of Man* (1924),
her and Reality (1925), *Relativity* (1925), and *Talks about
reless* (1925). In 1919 he received the Albert Medal of the
yal Society of Arts for his pioneer work in wireless telegraphy.
was president of the British Association in 1913–4, and of the
dio Society of Great Britain in 1925, and had been an F.R.S.
ce 1902.

ÓDŹ, Poland (*see* 16.862), the most important centre of cotton
d woollen manufacture in the country before the World War,
been deprived of its former outlet in the Russian Empire,
cotton spinning and weaving remains its most important
ustry. Łódź had a population of 451,813 in 1921, of whom
% were Poles and some 180,000 Jews. An exchange has been
established, and a school of social and economic studies was opened in 1925. Work on the drainage system and gas-works was to have begun in 1924. Łódź became the seat of a Roman Catholic bishop in 1920.

ŁÓDŹ-CRACOW, BATTLES OF.—The repulse at the end of Oct. 1914 of their first offensive in Poland (*see* VISTULA-SAN) placed the Germans in a perilous position on the Eastern Front. The Austrian armies were again in retreat, and were rapidly becoming demoralised; the Germans themselves, on the northern part of the Eastern Front, were greatly outnumbered and could expect no considerable reinforcement till the Ypres battle in the west had been decided. The evident intention of the Russian Commander-in-Chief, the Grand Duke Nicholas, was to advance on the great industrial region of Silesia. In their retreat from Warsaw and Poland the Germans had done their best by elaborate destruction of communications to impose as slow a rate as possible on this advance; but their numbers were insufficient to stem the oncoming tide of Russia's hordes by a direct defence. Invasion of German territory might be slow, but it seemed inevitable.

Ludendorff's Plan.—The German High Command solved their portion of the problem by placing Hindenburg, commander of the IX. Army, in charge of all German forces on the Eastern Front (VIII. and IX. Armies and Woyrsch's detachment) and instructing him to do his best without immediate reinforcement. Hindenburg kept Ludendorff as his chief of staff, and the latter at once proposed a characteristically bold solution. This was to withdraw the IX. Army from central and southern Poland and, taking advantage of the excellent railway system, to transfer it north to a base between Posen and Toruń (Thorn), from which to strike a blow at the Grand Duke's communications as he advanced southwest on Silesia. The plan was an audacious one. In the first place it left the direct route to the enemy's objective, the province of Silesia, barred only by the unreliable Austrians and by weak German elements. Ludendorff trusted to the destroyed communications and to the customary Russian sluggishness of manoeuvre for time sufficient to carry out the contemplated counterstroke. Secondly, East Prussia, again threatened by invasion, would be further denuded of defenders, for Ludendorff proposed to call on the VIII. Army to furnish a quota to his striking force. Lastly, the manoeuvre involved thrusting a body of between five and six corps within reach of Russian forces twice that size, and the greater the success of the blow, the deeper the penetration into the Russian rear, the heavier would be the weight of the enemy masses concentrated on it. But the result of the battle of Tannenberg had been to persuade Hindenburg and Ludendorff that disparity in numbers could be largely discounted with the Russians as foes.

Disposition of the Russian Forces.—On the Russian side, the first fortnight of Nov. 1914 saw the high-water mark of that onward sweep towards Germany of Russia's exhaustless masses, on which the Allies had built such high hopes. There were at this time eight Russian armies deployed. The X. Army, which had replaced the defeated I. Army on the eastern frontier of East Prussia, had begun to move forward. The I. and II. Armies, to the northwest and west of Warsaw, protected the flank of the main advance by the V., IV. and IX. Armies; on the south, the III. and VIII. Armies covered the left flank by pressure on the Austrian main forces in the direction of Cracow. But progress was slow, hampered by difficulties of supply; and already the Russians were beginning to feel that shortage of munitions and of trained drafts which was to lead to their disasters of 1915. Their armies were strung out in linear formation and no central reserves were available.

The point of attack chosen by Ludendorff for the IX. Army under Mackensen, which now comprised $5\frac{1}{2}$ corps and two cavalry divisions, was the junction between the I. and II. Russian Armies. The Vistula and Warta rivers, to east and west, would protect the flanks of the German advance. To prevent any transfer of Russian forces from north of the Vistula, a detachment, mainly of fortress troops, was to advance on Mława, while another pushed up the right bank of the river towards Płock.

The Russian I. Army was spread over a wide front with three corps north of the Vistula between Mława and Płock and two corps south of the river—the V. Siberian at Włocławek and the II. Corps (lately transferred from the II. Army) between Kutno and Łęczyca. The II. Army was on the Warta, west of Lódź, directed on Kalisz. The V. Army was on the left of the II. and was approaching the upper Warta.

First Battle of Lódź.—Mackensen began his advance on Nov. 11. On the 12th the isolated Siberian V. Corps at Włocławek was overwhelmed and driven back on Płock. Two days later the II. Corps acting as a link between the I. and II. Armies about Kutno, and the XXIII., the right corps of the II. Army, were defeated by greatly superior numbers and driven south. Scheidemann, commander of the Russian II. Army, now tried to wheel his corps from their line on the Warta to a position northeast of Lódź, the chief manufacturing town of Poland. But the German movements were too sure and rapid for the ponderous Russian counter-march. The columns of the II. Army were attacked in turn as they came up and were thrown back on Lódź.

Meanwhile the two defeated corps of the I. Army, now joined by the Siberian VI. Corps from north of the Vistula, were forced back towards Warsaw and away from Lódź. Into the gap between the two Russian armies Mackensen thrust three divisions, the two of the XXV. Res. Corps and the 3rd Guard Div. a his two cavalry divisions, with instructions to pass round t right flank of the II. Army and encircle Lódź from the sou A corps formed from the Breslau garrison, which had now co up from the west, was to turn the left wing of the Russian Army, pinned in front by the attacks of the German XI., XV and XX. Corps. Ludendorff was aiming at a second Tann berg, in which Scheidemann's army was to fill the same rôle had the unfortunate Samsonov's. The I. Res. Corps meanwh was by persistent attack to prevent the I. Army from int vening.

By Nov. 18 the position of the Russian II. Army seemed we nigh desperate. It was being driven into a narrow semi-cir round Lódź with both flanks turned, and was becoming exhaust and dispirited. But help from the V. Army was now close hand. Plehve, its commander, on receiving orders to turn ba to the assistance of the II. Army, acted promptly and with res lution. He attempted to rail one division north to Skierniewi but only one regiment got through before Mackensen's caval cut the line. The rest of the division came into action Nov. 19, south of Lódź against the turning movement of t German XXV. Res. Corps. The whole of the remainder the V. Army marched north on the 18th, the gap it left on t

. Army's right being filled with cavalry. That same night the berian I. Corps relieved the pressure on Scheidemann's left by successful attack on the German XI. Corps. Next day the X. Corps routed the Breslau troops. This restored the situa- n on the west side of Łódź; but to the east and south of the wn Schaffer's XXV. Res. Corps and 3rd Guard Div. were still vancing. By the evening of Nov. 20 they had completely rned the right of the Russian II. Army and were attacking dź from the south.

During Nov. 21 Ludendorff persisted in a last effort to accom- sh the destruction of the Russian II. Army, but the attacks finitely failed. By the 22nd the tables had been turned, and haffer's force was itself completely surrounded. While part of ehve's army, after rescuing the left of the II. Army, turned to tack Schaffer's group south of Łódź, Rennenkampf, the com- ander of the I. Army, had been ordered to despatch forces om Łowicz and Skierniewice to gain touch with the II. Army d close the German line of retreat to the north. The Łowicz rce, which consisted of 3½ divisions, started on Nov. 20 and by e evening of the 22nd, in spite of three changes of command and different staff work, had captured Stryków and Brzeziny, and d apparently sealed the gap between the Russian I. and II. mies. The Russians actually ordered up 18 trains to remove e anticipated harvest of prisoners. The Skierniewice column a division and a regiment accomplished nothing.

Escape of Schaffer's Force.—In the evening of the 22nd, Schaf- r, heavily engaged with part of Plehve's army, south of Łódź, ceived a wireless order from Mackensen to cut his way out by zeziny. During the night of Nov. 22, in intense cold, he suc- eded in slipping from the grasp of the enemy opposing him and ncentrating his weary divisions to make their bid for release. known to him, the Russians had already opened a breach. e centre columns of the Łowicz force had marched on to Łódź, ving the left column, the Siberian 6th Div., isolated west of oluszki on the Warsaw-Łódź railway. This division fought llantly during Nov. 23 and repulsed all efforts of the XXV. s. Corps to escape. Further west, however, the 3rd Guard v. moving through the Galkówek forests, found the gap in e Russian net and captured Brzeziny in the early hours of ov. 24. Encouraged by this success, the XXV. Corps renewed efforts against the hapless Siberian 6th Div., whose appeals help were disregarded by other Russian formations within sy reach of the battlefield. Finally, the division, with both nks turned and overborne by weight of numbers, broke and t the way open for the XXV. Res. Corps to rejoin the 3rd ard Div. at Brzeziny. Schaffer's line of retreat was now ar, and on the 25th his whole force, moving by Stryków, re- ned Mackensen. He brought with him several thousands of soners and a number of captured guns.

Effect of the Battle.—Ludendorff's bold stroke had stopped the and duke's intended invasion of Silesia as effectively as Sir hn Moore, by a similar move, had halted Napoleon's incursion o Spain a little more than 100 years before. Never again ring the War were the Russians in a position to threaten Ger- n territory. The campaign shows well the value of mobility a strategical weapon. On Oct. 26 the IX. Army was engaged posite Warsaw during Hindenburg's first offensive. During e next fortnight it retired 120 m. destroying the communica- ns as it went; reorganised and repaired its losses; was trans- rred by railway across the enemy front; and deployed in com- te fighting trim for its new offensive on Nov. 11. This shows rman organisation and efficiency at its highest. The quality German leadership was also well-displayed, and was in strong ntrast with the irresolution and inertia shown by some of the ssian commanders.

Schaffer's exploit was a masterly one; within a few hours of ceiving his orders to retire, he had succeeded in breaking off ion and setting his columns in motion to seek a way to safety, ich his determination and the fine fighting spirit of his troops s to win. Compare this with the inaction of many of the ssian commanders, particularly the failure of the numerous dies within reach to come to the rescue of the Siberian 6th Div. on Nov. 23. Ludendorff had owed much to Rennenkampf's passivity for his victory at Tannenberg; here again Rennenkampf's inefficiency and lack of the will to victory saved him from the loss of Schaffer's force which his rashness and obstinacy had exposed. Yet Rennenkampf had been accounted a dashing leader of men before the War. The Grand Duke himself, Ruzski (the commander of the Northwest Front), and Plehve, who hid an iron will in a weak and wizened frame, all acted promptly and with determination to take advantage of the opportunity.

Second Battle of Łódź: Dec. 1–15.—At the end of Nov. Hindenburg received reinforcements of four corps from the west, released by the termination of the first battle of Ypres. He now advanced again and captured Łódź on Dec. 6 and Łowicz on Dec. 15. The Russians fell back to the Bzura-Rawka river line in front of Warsaw, which they were to hold until Aug. 1915. Meantime an attack by the Austrian II. Army towards Piotrków in the first week of Dec. had been repulsed.

Battles round Cracow: Nov. 15–Dec. 25.—While the fighting round Łódź was taking place in the north, fierce battles were being waged in southeast Poland and western Galicia between the Austrian main armies and the Russian left wing. These battles were indecisive in their results and have less interest, strategically and tactically, than the battles round Łódź.

After the fighting on the San and round Dęblin (Iwangórod) in the latter part of Oct. the Austrian I. and IV. Armies fell back gradually on Cracow, followed up slowly by the Russian IV. and IX. Armies. The Austrian II. Army (two corps), was railed north to fill the gap on the left of Woyrsch's force caused by the withdrawal of the German IX. Army for Hindenburg's counterstroke in north Poland. The front of the II. Army was taken over by the III. Army, which now held the line of the Carpathians as far east as the Uzsok pass. The eastern Carpathians down to the Bukowina were guarded by Pflanzer-Baltin's group. To defend western Galicia between the fortress of Cracow and the Carpathians, a group consisting of the XI. Corps and some cavalry was formed and took up station on the line of the middle Dunajec. The Austrian plan was to meet the expected attack towards Silesia of the Russian V., IV. and IX. Armies with Woyrsch's army and the I. Army, while the II. Army from the north and the IV. Army from the south wheeled against the enemy's flanks.

The Russian advance was slower and more cautious than had been expected; their V. Army had to turn about on Nov. 17 to rescue the II. Army at Łódź; while the IV. and IX. Armies on approaching Cracow halted for the III. Army in Galicia to come forward and invest the fortress. On Nov. 17, therefore, as soon as the Austrian II. Army had completed its detrainment and come up into line, the Austrian armies north of the Vistula took the offensive. A week of attack and counter-attack followed with little advantage to either side. Radko-Dimitriev's III. Army had meanwhile come up to the Dunajec; he passed one corps over to the north of the Vistula to enable the IX. Army to parry the thrust at its left flank of the Austrian IV. Army; with the remainder he drove back the Austrian XI. Corps to a defended position east of Cracow.

Final Encounters of 1914.—Conrad, the Austrian chief of the general staff, now planned a new combination. He passed part of the IV. Army over by rail to the left wing of the Austrian III. Army near Limanowa for a counter-stroke at Radko-Dimitriev's left. This was made on Dec. 3, and the fighting soon became general along the whole front between the Vistula and the Carpathians. Brusilov's VIII. Army, facing the Austrian III. Army along the Carpathians, sent a corps by Nowy Sacz to the assistance of Radko-Dimitriev, but was thereafter itself heavily attacked. On Dec. 15, after the loss of Łódź and Łowicz in the north, the Grand Duke issued orders for a general withdrawal in South Poland and Galicia to winter lines. The V., IV. and IX. Armies fell back to the Nida line, and the III. Army to the Dunajec. Brusilov's VIII. Army, however, on the extreme left, counter-attacked the Austrian III. Army between Dec. 18 and 25 and drove it back to its former position in the Carpathians (battle of Jasto). This brought to an end the campaigns of 1914.

The Russian "steam-roller," which the Allies in the West had so confidently expected to see smashing over its foes with irresistible, if deliberate, momentum, had come to a standstill for want of fuel. The Grand Duke's decision in the middle of Dec. to break off battle and retire was occasioned mainly by the shortage of munitions and the impossibility of keeping the ranks filled with trained drafts to replace the heavy wastage due principally to that very lack of a sufficiency of shells and other material of war. But the Russians had most loyally done their best under great disadvantages to live up to the expectations which their allies had formed of them. It was the machine, antiquated and behind the age, that fell short of the stern requirements of modern war.

LOEB, JACQUES (1859–1924), American physiologist, was born in Alsace, France, April 7 1859. Graduating at Ascanisches Gymnasium, Berlin, he studied medicine in Munich and Strasbourg (M.D., 1884). He was assistant in physiology at the universities of Wurtzburg (1886–8) and Strasbourg (1888–90), working also at the Naples biological station from 1889–91. He went to the United States in 1891 and taught biology at Bryn Mawr for a year. He became assistant professor of physiology and experimental biology at the University of Chicago in 1892, being appointed associate professor in 1895 and professor in 1900. In 1902 he became professor of physiology at the University of California. From 1910 to the date of his death he was head of the division of general physiology at the Rockefeller Institute for Medical Research. He died at Hamilton, Bermuda, Feb. 11 1924. Dr. Loeb's work was chiefly directed to a pursuit of the real distinction between living and dead matter, the thesis upon which he worked being that all living things are chemical machines and that their workings are open to the same mechanistic explanation as are those of any machines made of inert matter. Among his published works are *The Heliotropism of Animals and Its Identity with the Heliotropism of Plants* (1890); *Physiological Morphology* in 2 vol. (1891–2); *Comparative Physiology of the Brain and Comparative Psychology* (1900); *Studies in General Physiology* (1906); *The Dynamics of Living Matter* (1906); *The Mechanistic Conception of Life* (1912); *Artificial Parthenogenesis and Fertilisation* (1913); *The Organism as a Whole* (1916); *Forced Movements: Tropisms and Animal Conduct* (1918).

LOEB, JAMES (1867–), American banker and philanthropist, was born in New York City Aug. 6 1867. On his graduation from Harvard College in 1888, he became a member of the firm of Kuhn, Loeb & Co., bankers, New York City, retiring from business in 1901. In 1905 he founded and endowed the Institute of Musical Art in New York City. He devoted much of his time to classical archaeology. He was the founder of the Loeb Classical Library of Latin and Greek authors, works which give text and translation on adjacent pages. The first volume appeared in 1912. He was instrumental in founding the Deutsche Forschungsanstalt für Psychiatrie, an institution in Munich for the systematic study of the causes of mental diseases. He translated from the French: P. Decharme's *Euripides and the Spirit of His Dramas* (1906), M. Croiset's *Aristophanes and the Political Parties at Athens* (1909) and P. L. Legrand's *Daos* (1917).

LOGIC (*see* 16.879).—The most important contributions to logic during the pre-War years, 1911–4, are to be found in two works of H. Driesch, *Ordnungslehre* (1912) and *Die Logik als Aufgabe* (1913), in the *Encyclopaedia of Philosophical Sciences*, vol. 1, *Logic* (1913), and in the new, enlarged edition of B. Bosanquet's *Logic, or the Morphology of Knowledge*, 2nd ed. (1911). J. M. Baldwin's *Genetic Logic*, vol. 3 (1911) only carried a stage further the work which was inaugurated five years earlier; Miss E. E. C. Jones' *New Law of Thought* (1910, etc.) was of limited interest; P. Coffey's *Science of Logic* (1912) was intended as a textbook for Catholic students; C. A. Mercier's *New Logic* (1912)
and F. C. S. Schiller's *Formal Logic* (1912) display more c
tempt than understanding for traditional logic.

Like other human pursuits logic suffered during the W
War. The years 1915–8 are almost a blank in the history
logic—J. Dewey's *Essays in Experimental Logic* (1916) be
mainly a collection of older essays, and A. E. Davies' *Textb*
of Logic (1915) being only a textbook.

WRITERS AND THEIR VIEWS

Driesch.—According to Driesch, logic is the theory of or
The theory of order results from self-reflection. Its most c
prehensive principle is that of the economy of assertions. T
principle is not merely a matter of convenience, but expres
the essential nature of thought. In this respect Driesch dif
from Avenarius and Mach. According to Driesch the fun
mental truth of philosophy is "I think something." Now wh
ever is thought is thought to be orderly; and the task of logi
to ascertain what makes experience orderly. Thought is alw
directed to problems, which it endeavours to solve by plac
them in some orderly system. It is with the help of thought t
life achieves progressive orderliness.

Royce.—Of the six essays on logic contained in the first v
ume of the *Encyclopaedia of the Philosophical Sciences* the m
important is that by J. Royce, who, like Driesch, tries to tr
logic as a science of order. In his account of induction, he den
that inductive reasoning is guided by the principle of the u
formity of nature, or by the principle of sufficient reason. Neith
helps the investigator to decide whether, or to what extent,
may generalise in a given case. According to Royce the valid
of induction rests on the assumption of some order in the obje
investigated, and the reliability of a "fair sample" as a mea
of judging a whole range of facts. A fair sample is one chos
without bias. Of such samples, he maintains, there are alwa
more that more or less resemble the whole than such as dif
widely from it; so that judging a whole range of facts by mea
of a random sample is more often approximately right th
wholly wrong. The chief advantage of mathematical sciences
that the mathematical results deducible from hypotheses needi
verification present a vast range of samples, and the precision
mathematical concepts renders it easy to decide whether
observed sample agrees with the anticipated result.

Bosanquet.—The new edition of Bosanquet's *Logic* contai
considerable additions. Book II., Chapter 8, deals with the cri
cism that his theory of judgment commits him from the sta
to metaphysical absolutism. If every judgment qualifies reali
by an abstract universal, and no combination of such universa
can confer particular individuality, there can be but one ultima
individual to which all predicates belong. This is absolutis
Bosanquet retorts that no finite individual is self-dependent
self-contained, that is, a real substance. Even the self finds
reality in something beyond itself. But an individual not se
complete can be predicated of the whole of which it is a par
Chapter 9 discusses criticisms of the coherence theory of trut
Bosanquet maintains that Truth is its own criterion—it ca
only be tested by more of itself. Any system can be tested fu
ther only by being made more complete. The view that truth
only an adaptation to vital needs, is claimed by Bosanquet
be the same view in principle. But while approving the attem
to claim for logic the realm of life and practice, and to apply th
general idea of natural selection to the development of though
Bosanquet protests against the narrow conception of practi
which limits it to external action.

Intimately connected with the coherence theory of truth
his subsequent book on *Implication and Linear Inference* (1920
According to this all inference is of the same type, namely, in
plication. The essence of implication is interrelation betwee
the parts of a system (or concrete universal), which makes mo
ification in some parts clues to the modification of others. Sy
logistic inference is linear, not systematic, and therefore not tru
inference. In true inference we survey a system of facts, see i
in its relation to the whole of reality, and read off the implic
tions. The inference is immediate if we can read off the implic

ions directly; it is mediate if we must construct this system rst. The starting-point of all inference is the realisation that o deny the truth of *all* propositions would involve self-contra-iction, denying this very denial. We must consequently believe *ome* propositions, even if we question the truth of this or that roposition. In true inference we transfer our certainty that *ome* propositions are true to the truth of the proposition inerred. In the last resort, all inferences may be reduced to the lternatives: "Either this proposition is true, or no proposition s." Within the system from which we start we read off conlusions the denial of which would shatter the whole world of ur experience.

Bradley.—The philosophical absolutism of Bosanquet is also mphasised in F. H. Bradley's *Essays on Truth and Reality* 1914) and in the new edition of his *Principles of Logic* (pubshed in 1922 with numerous additions). Bradley repudiates is previous assumption of ideas divorced from judgments, and f judgments divorced from inference. The concrete conceptual act is inference, of which mere ideas and simple judgments are are abstractions. Inference is the ideal self-development of a iven object taken as real. The given object is an ideal content efore us, and it is taken to be real as being in one with reality, r the real universe. The possibility of inference rests upon the act that the object is not only itself, but is also contained as an lement in a whole; in fact, it *is* itself only as being so contained. rom the nature of the case inference must always be incomplete, nd subject to unknown conditions. But this ultimate problem oes not concern logic.

Other Writers.—Among new editions of older books on logic nention may also be made of H. W. B. Joseph's *Introduction to ogic*, 2nd ed. (1916), W. Wundt's *Logik* (3 vol., 4th edition, 919–21), L. T. Hobhouse's *Theory of Knowledge* (1921) and . Höfler's *Logik* (1922). Wundt's *Logik* has not undergone any adical changes, and retains its important place. Hobhouse easserts his fundamental principles that the systematic interonnection of judgments is the true line of advance in the interretation of reality, and that the categorical judgment asserts a eality independent of itself. Höfler's *Logik* is practically a new ook. While excluding epistemology it includes a good deal of sychology and philosophy. More particularly it shows the nfluence of A. Meinong's *Gegenstandslehre*, which distinguishes existence" from "being," of which it is only one species. Vhatever is false has being, but not the being of what is true. n the whole, Höfler defends traditional logic, holding that the yllogism, for instance, formulates a kind of reasoning actually sed in practical life, even if there are also other forms of reasonng. One of the novelties of the book is the classification of udgments into four classes according to their evidence, namely,) those immediately evident and certain, (2) those mediately vident and certain, (3) those immediately evident and probable, nd (4) those mediately evident and probable. The book also ontains a number of essays on logistics by E. Mally.

Johnson —The most ambitious new work on logic during the eriod 1911–25 is that of W. E. Johnson. His *Logic* is planned four parts and is intended to cover the whole field. (Part I. ppeared in 1921, Part II. in 1922 and Part III. in 1924; Part V. has not appeared yet.) Logic is conceived to be concerned ith the analysis and criticism of thought, and it is considered npossible to draw a rigid distinction between logic and philosphy, or between logic and science. In thought he distinguishes vo aspects, an epistemic and a constitutive aspect. The conitutive aspect consists of the content of knowledge (which has self a logically analysable form); the epistemic aspect is that hich depends on the variable conditions and capacities for the cquisition of knowledge. The unit of logic is the proposition r that of which truth and falsity can be significantly prediated). In contrast with the rather common class-interpretation propositions, Johnson lays stress on the intensive aspect. Implication" is potential inference, and assumes different elations in different cases. There are two principles of deducve inference:—(1) The applicative principle states that a propsition of the form *All S is P* warrants the inference of a proposition of the form *The given S is P*. (2) The implicative principle states that a compound proposition of the form '*x*' *and* '*x implies y*' warrants the inference of a proposition of the form '*y*'. The syllogism involves both principles. The following argument may illustrate each of the two principles and their combination in the syllogism:

(1) Applicative principle	All quadrilaterals have their opposite sides equal, if they are parallel (every MP is p if m). ∴ The quadrilateral ABCD has its opposite sides equal, if they are parallel (the given MP is p if m).
(2) Implicative principle	The quadrilateral ABCD has its opposite sides paralled (the given MP is m). ∴ The quadrilateral ABCD has its opposite sides equal (the given MP is p).

Johnson distinguishes between the constitutive and the epistemic conditions of valid inference. The constitutive condition is that the premises must be *true* and must *imply* the conclusion. The epistemic condition is that the thinker must be in a position to *know* that the premises are true, and that they imply the conclusion, without having to know beforehand that the conclusion is true. But now, the two principles of deductive inference require universal premises. How are these obtained? Johnson says, by *induction*. But he uses the term induction in an unusually wide sense, namely:—for any process of starting from certain instantial premises and reaching a generalisation. He formulates four types of induction, namely:— (1) *intuitive*, (2) *summary*, (3) *demonstrative* and (4) *probable*. Of these the last corresponds to ordinary empirical induction; and *summary* induction corresponds to so-called perfect induction. By *intuitive* induction Johnson means the process by which we obtain the fundamental principles of inference and the axioms of pure logic, mathematics, etc. It is not suggested that these are merely empirical generalisations, but that they are obtained by reflection on particular instances of them. This may happen in two ways:— (1) the *counter-applicative* way, when we can see that what is true of this instance is true of any other instance, and (2) the *counter-implicative* way, when, having made a particular inference which is valid, we can see that its validity is due to a certain type of formal relation which holds between the premises and the conclusion. These modes of procedure cannot be safely applied without special insight into the subject-matter of the investigation.

Under *demonstrative* induction are included certain types of hypothetical syllogism in which the instantial premise leads to a universal conclusion. For example:— "Every specimen of argon has some the same atomic weight. This specimen of argon has atomic weight 39·9. Therefore, every specimen of argon has atomic weight 39·9." Under the same head Johnson also includes the familiar canons of induction as reformulated by himself in four figures of agreement, difference, composition and resolution. Of *problematic* induction there are two varieties. There is *pure generalisation*, that "All things which are *m* are *p*," if all the observed things which were *m* were also *p*; and there is *class-fractional* induction (usually called statistical generalisation), that "a certain proportion of things which are *m* are also *p*," that proportion having been noted in the observed cases. From all these forms of induction Johnson distinguishes under the name of *Eduction*, the argument from "certain instances of *s* which are *m* are *p*" to "the next *s* that is *m* will also be *p*." The discussion of various psychological and metaphysical problems is a striking feature of Johnson's *Logic*.

The only other contemporary attempt at a comprehensive logic is Th. Ziehen's *Lehrbuch der Logik auf positivistischer Grundlage*, etc. (1920). This treatise contains not only much that is psychological and metaphysical but also a history of logic, which is perhaps the most useful part of it.

On the whole, logic has not yet reached the stage of having clearly defined boundaries, and is apt to trespass on the domains of mathematics and psychology, of epistemology and ontology, according to the taste of the writer. Its state is like that of Israel under the Judges, every man doeth that which is right in his own eyes. There are signs, however, that the necessary differentiation may come about in another way. There is a marked tendency towards a greater division of labour, as may be seen from the number of treatises devoted entirely to special groups of logical problems, such as those of formal-symbolic inference (or logistic), the methodology of the sciences, the theory of knowledge (or epistemology) at the basis of science, etc.

Bibliography of books not already mentioned:—

Formal-Symbolic.—L. Conturat, *Algebra of Logic* (1914); C. I. Lewis, *A Survey of Symbolic Logic* (1918); L. Wittgenstein, *Tractatus Logico-Philosophicus* (1922); B. Russell and A. N. Whitehead, *Principia Mathematica* (1925).

Methodological.—J. M. Keynes, *Treatise on Probability* (1921); A. D. Ritchie, *Scientific Method* (1923); J. Nicod, *Le Problème Logique de l'Induction* (1924); A. Wolf, *Essentials of Scientific Method* (1925).

Epistemological.—B. Russell, *Problems of Philosophy* (1912), and *Our Knowledge of the External World* (1914); E. Becher, *Naturphilosophie* (1914); D. C. Macintosh, *The Problem of Knowledge* (1916); E. Mach, *Erkenntnis und Irrtum* (1917); H. Dingler, *Die Grundlagen der Physik* (1919); A. N. Whitehead, *An Enquiry Concerning the Principles of Natural Knowledge* (1919–25), and *Concept of Nature* (1920); E. Meyerson, *De l'Explication dans les Sciences* (1921); E. Becher, *Geisteswissenschaften und Naturwissenschaften* (1921); B. Bavink, *Ergebnisse und Probleme der Naturwissenschaften* (1921); C. D. Broad, *Scientific Thought* (1923); T. L. von Haering, *Philosophie der Naturwissenschaft* (1923); C. D. Broad, *The Mind and its Place in Nature* (1925); E. A. Burtt, *Metaphysical Foundations of Modern Physical Science* (1925); W. P. Montague, *The Ways of Knowing* (1925). (A. Wo.)

LOGUE, MICHAEL (1840–1924), Irish ecclesiastic, was born at Kilmacrenan, Co. Donegal, Oct. 1 1840. He was appointed professor of theology and belles-lettres at the Irish College in Paris, where he was ordained a priest in 1866. He became Bishop of Raphoe in 1879, archbishop of Armagh in 1887, and in 1893 was raised to the cardinalate. During the World War he deprecated participation by the clergy in Sinn Fein agitations, but in 1918 opposed conscription on moral grounds. In 1919 and 1921 he rigorously denounced the campaign of murder against the police and the military, at the same time criticising severely the policy and methods of the British Government. He died at Armagh Nov. 19 1924.

LONDON, JACK (1876–1916), American novelist, was born at San Francisco Jan 12 1876, and educated at the University of California. A born adventurer, he went to sea at the age of 17 and served before the mast. He went with the first rush to Klondike in 1897 and tramped across the States and Canada, being in gaol more than once as a vagabond. In 1904 he went to Japan as war correspondent, and in 1914 to Mexico in the same capacity. In 1906 he started on a voyage round the world in a 50-ft. ketch-rigged yacht and disappeared for two years. His novels, for the most part published first in London, reflect his wild, adventurous life, the best known being *The Son of the Wolf* (1900); *The Call of the Wild* (1903); *Moon Face* (1906); *Martin Eden* (1909); *South Sea Tales* (1912); and his last, *The Little Lady of the Big House* (1916). He died at Glen Ellen, Cal., Nov. 22 1916. See *The Book of Jack London* (1921), by his wife, Charmian London.

LONDON (*see* 16.938).—Greater London had, in 1926, a population of about 7,500,000 persons, but nothing has occurred in the years since 1910 to alter materially the story of its site, although under the heading of climate some diminution in the density of its fogs may be noted.

Divisions, Buildings and Communications

The characteristic divisions so well marked in the past have been gradually broken down since the close of the War, and for various reasons many large private houses have been converted into flats, maisonettes, boarding-houses, and, nearer the centre, business premises. The residential turnover is most marked in regions north and south of Hyde Park, while in boroughs such as Hackney or Stepney or those lining the south bank of the river the tendency is towards the intrusion of business. In the suburbs, after the complete cessation of house building, growth has been resumed, and has been fostered by the electrification of railways or the extension of railways previously electrifie and the development of motor transport. An interesting featur before the War was the establishment of the Hampstead Garde Suburb in the north of London, in which the houses were limite to eight per acre. A very important factor in the developmen of Greater London was the passing of the Unemployment (Relief Works) Act of 1920, designed to benefit ex-service men which permitted land required for new roads to be entered upo within seven days. Under this Act it was possible to provide i the outer area many of the urgently required main and relie roads before access to the centre was hopelessly blocked by th multiplication of housing schemes.

The period since 1910 included also some very important change in the aspect of the streets in the central area, the greates perhaps being the passing of Nash's Regent street and Quadrant All idea of a unified scheme for rebuilding was abandoned excep for the Quadrant itself, where an adaptation of the plan o Shaw's Piccadilly Hotel was followed. The widening of th Strand advanced considerably, and the Kingsway and Aldwyc improvement initiated in 1899 was brought appreciably nearer conclusion. Other improvements completed included the Woolwic Tunnel in 1912 and the opening from Trafalgar Square into th Mall by way of the Admiralty Arch. Cross-river communications were improved by the reconstruction of Southwark Bridge while the money for a new road bridge at Lambeth was vote by the London County Council. A movement that threatene completely to alter the appearance of the western districts wa inaugurated by the sale of the garden ground in Morningto Crescent and Endsleigh Gardens, a new building on a portio of the latter open space being finished in 1926.

Parks.—Parks and open spaces continued to be added to th amenities of the city and the outer areas, the most importan including the clearance and opening to the public of a portio of the river front at Shadwell and the preservation of Prince' Square, Stepney, in the built-up area. In the outer areas progres was made in the preservation for the public enjoyment of th wooded bastion of Shooters Hill to the south-east, and an important addition to Hampstead Heath and Parliament Hil Fields on the north was secured by the purchase of a considerabl portion of Lord Mansfield's estate known as Kenwood.

Monuments.—The historical monuments of the past wer not greatly interfered with during the period, although considerable perturbation was caused by the publication of a repor containing suggestions for reorganising the work of the Churc of England in the City of London that indicated the possibl sale of 19 churches, including many designed by Wren. Late still signs of weakness appeared in the foundations of Waterlo Bridge which led to a unanimous resolution of the London County Council to remove the entire structure, action bein only delayed on the urgent representations of a number of leading professional and learned societies. The report of the expert on the steps necessary for preserving the dome of St. Paul' Cathedral led to the closing to the public in 1925 of the whol space beneath the dome and the choir. Important works o preservation were also undertaken for the roofs of Westminste Hall and the Great Hall at Hampton Court Palace.

New Buildings.—The modern architecture of the metropolis was enriched by the addition of a number of striking buildings including (to mention only a few) the new London County Hal at the east end of Westminster Bridge, the Port of London Authority home in Trinity Square, Britannic House and Adelaide House in the City, Bush House at the end of Kingsway, Australia House in Aldwych, the Wesleyan Central Hall and the Middlesex Guildhall in Westminster, the Royal Automobile Club in Pall Mall, the new north frontage of the British Museum and the headquarters of the British Medical Association in Bloomsbury. A considerable impetus was given to the production of fine street architecture by the institution of a medal by the Royal Institute of British Architects for the best street façade completed each year. The first to win the award was the new Wolseley building in Piccadilly, and the next the Shepherds Bush Pavilion. The general tendency towards change was most arked in the City area, where the spires and towers of Wren at had so long dominated the view were slowly but surely gulfed in the rising tide of commercial architecture, the most otable instance being the almost total eclipse of the view of t. Magnus spire and the Monument from London Bridge by e erection of Adelaide House.

In the west end another marked transformation was the erec-on of a huge block of millionaire flats and shops on the site of evonshire House, Piccadilly. The monuments and memorials the metropolis were added to in a marked degree, though not ways as the result of the World War, for the period included e completion of the Queen Victoria Memorial before Bucking-am Palace and the King Edward VII. Memorial in Waterloo lace. Amongst the many war memorials should be mentioned e Cenotaph in Whitehall, the Grave of the Unknown Warrior Westminster Abbey, the memorial to London's soldiers in ont of the Royal Exchange, Belgium's Gratitude and the Air orce Monument on the Embankment, and the Artillery and achine Gunners' memorials at Hyde Park Corner. Work on e Guards' Memorial on the Horse Guards Parade was started 1925. Interesting additions to the nomenclature of London ere made in various districts, particularly the revival of the ame Aldwych for the crescent section of the Holborn to Strand nprovement, and that of Petty France to the roadway in West-inster passing under the shadow of Queen Anne's Mansions.

Communications.—Communications, as far as the trunk lines rving the metropolis were concerned, received no additions, ut a vast change was almost imperceptibly carried out by the rouping of the great companies. The introduction of electri-l working on many suburban lines was another feature of is period. Although no entirely new tube was opened, the construction of the old City and South London line was ken in hand and completed, with its junction with the Hamp-ead Tube at Camden Town, and work was started on an ex-nsion of the line to Morden. The Golders Green terminus was nnected with Edgware, and a new tunnel beneath the Thames om Charing Cross to Waterloo and Kensington was also start-l. A tube was specially constructed by the Post Office for nnecting up the various sorting offices, and private proposals r an even more comprehensive system for goods traffic con-cting the various termini were laid before the Ministry of ransport. Horse traction vanished finally from the tramway stems, now operated almost entirely by the London and Mid-esex County Councils, and the L.C.C. lines were extended a tle nearer the City by being carried over the new Southwark ridge, but no lines were actually permitted through the City West End, although proposals for this were discussed.

The principal change in traffic was, however, the enormous in-ease in the number of motor omnibuses plying in the streets, ought about by the appearance of numerous independent mpanies, popularly termed "pirates," while the London Gen-al Omnibus Co. ran more frequent services and operated any fresh routes, including some running right out into the rrounding country during the summer months; and many w and improved types of omnibuses were placed on the streets, cluding a few with covered tops. The chaotic conditions intro-ced by this great increase in the number of vehicles, and by e appearance of independent omnibus companies, combined times with the operation of a great number of road repairs, me no doubt delayed by the War, finally led to a great step rward in the control of traffic, which took the form of the pointment of a London traffic advisory committee, whose ties were to advise the Ministry of Transport on matters ating to London traffic.

An important addition to the continental facilities of London s the opening of daily Air Services to Paris, Brussels and nsterdam, connecting with other services to all parts of Europe d also to Africa.

POPULATION, EDUCATION AND AMENITIES

The population of Greater London in 1911 was 7,251,358, and 1921 7,480,201; while that of the administrative county was 4,521,685 in 1911, and 4,484,523 in 1921. That of the outer ring was 2,729,673 in 1911 and 2,995,678 in 1921, while that of the City was 19,657 in 1911 and 13,709 in 1921. Greater London increased by 10·2% between 1901 and 1911, and by 3·2% between 1911 and 1921, while the county of London had decreased by 0·3% and 0·8%. The statistics for the metropolitan boroughs are as follows:—

	Area in statute ac.	Population		Increase (+) or Decrease (−)
		1911	1921	
Battersea	2,163	167,743	167,693	− 50
Bermondsey	1,503	125,903	119,455	− 6,448
Bethnal Green	760	128,183	117,238	−10,945
Camberwell	4,480	261,328	267,235	+ 5,907
Chelsea	660	66,385	63,700	− 2,685
Deptford	1,564	109,496	112,500	+ 3,004
Finsbury	587	87,923	76,019	−11,904
Fulham	1,706	153,284	157,944	+ 4,660
Greenwich	3,859	95,968	100,493	+ 4,525
Hackney	3,287	222,533	222,159	− 374
Hammersmith	2,287	121,521	130,287	+ 8,766
Hampstead	2,265	85,495	86,080	+ 585
Holborn	405	49,357	42,796	− 6,561
Islington	3,092	327,403	330,028	+ 2,625
Kensington	2,290	172,317	175,686	+ 3,369
Lambeth	4,083	298,058	302,960	+ 4,902
Lewisham	7,015	160,834	174,194	+13,360
Paddington	1,357	142,551	144,273	+ 1,722
Poplar	2,331	162,442	162,618	+ 176

Health and Hospitals.—The birth-rate for the administrative county was 20·9 in 1922 and 20·1 in 1923 per 1,000 population. In Greater London the figures for the same years were 20·2 and 19·5. The death-rate for the same periods in the administrative county was 13·5 and 11·4 per 1,000 population, and for Greater London 12·5 and 10·7. In the hospital world great campaigns were instituted to place the leading institutions on a firm financial basis, and considerable alterations and improvements were carried out at Westminster and St. George's amongst others, while the removal of King's College Hospital to Denmark Hill was completed. During 1925 it was decided to rebuild the Middlesex Hospital. The growing share of women in the hospital work of London was illustrated by the existence of several hospitals entirely managed by them. The activity of the London County Council was notable in the direction of the improved treatment of tuberculosis and other virulent diseases, and in the campaign against infant mortality.

Water, Lighting and Heating.—The water supply of London was largely increased by the completion in June 1925 of the huge reservoir at Littleton with a capacity of 6,750 million gallons and a water surface of 723 acres. The estimated income of the Water Board for 1925–6 from all sources was £4,695,000, and the estimated expenditure £4,809,120, but as a balance was brought forward no precept on the participating authorities was needed. The policy of the board, adopted in 1916, to save coal by chlorinating raw Thames water, some 70,000,000 tc 100,000,000 gal. per day, was entirely successful both financially and from the point of view of the public safety. The treated water is allowed to flow by gravity down the Staines aqueduct instead of being pumped into the reservoir. Figures give but little idea of the size of the board's undertaking to the average person, but it may be stated briefly that in the average daily consumption of water (about 36 gal. per head), London would empty 2½ times daily a tank as large as Trafalgar Square (two and a half acres) and as high as the Nelson Column.

An important step in the lighting (and heating) of London was the appointment under the Electricity (Supply) Act 1919 of electricity commissioners to supervise the supply of electricity under the Ministry of Transport. The electricity district as determined extends well beyond the area known as Greater London, covering 1,858 sq. m.; the current in this area being distributed by 44 local authorities and 44 private companies. That there is plenty of room for both electricity and gas in supplying the metropolis with light and heat is evident from the fact that one of the largest of the gas companies in 1925 reported an increase of 24% in its sales during the preceding 10 years.

By the end of 1922–3 the cost of the fire brigade had risen to nearly £800,000 (including pensions), and the number of calls attended, other than chimney calls, during the same period was 3,845. The curve of value of insured property in London showed a marked increase in the preceding 10 years, the total reaching over £2,000 million.

Education.—The general trend of education in London is naturally in accordance with that of the whole country, but it is interesting to note that its total cost to London during 1922–3 amounted to over £12,000,000, of which, of course, approximately half was refunded by exchequer grants, so that the actual charge on the rates amounted to a fraction over 31d. in the £1. The London County Council is the statutory authority for the administrative county of London, and the education committee of 50 includes 12 co-opted members who must be persons of experience in education and of whom five must be women. In 1925 there were 17 women members altogether on the committee. The council had not in 1925 availed themselves of the power to extend the age for compulsory attendance at school conferred on them by the Education Act of 1921.

Recreation.—The museums, art galleries, etc., requisitioned for use during the War, gradually resumed their normal functions, and a new feature was introduced in the form of guide lecturers to conduct parties round the various sections. New rooms were added to the Tate Gallery, and the British Museum was greatly enlarged by the wing to the north opened in 1914. The London Museum, on the lines of the Musée Carnavalet in Paris, was removed from Kensington Palace to Stafford (now renamed Lancaster) House owing to the generosity of Lord Leverhulme, and a special museum illustrating the development of furniture making was opened in Hoxton in 1914 in the centre of the cabinet-making district of London.

Several new theatres were opened during the early part of the period under review, including the Winter Garden in Drury Lane, the Ambassadors and St. Martin's in Seven Dials and Princes in Shaftesbury avenue. A movement was started to reconstruct the old Sadlers Wells Theatre and open it on the same lines as the "Old Vic." After the War few new theatres were built, but on the other hand there was an enormous increase in the number and size of cinematograph houses, one of which, namely, that at Shepherds Bush, as already mentioned, won the medal for the best street frontage for the year offered by the Royal Institute of British Architects.

The demand for playing pitches for games of all sorts in public recreation and other open spaces increased exceedingly, and amongst other innovations many hard courts for lawn tennis were laid down by the London County Council. Professional football was largely supported also, and the construction of the British Empire Exhibition grounds at Wembley saw the removal of the Final for the Football Assn. Cup to the Stadium. "Saturday" starts in first-class cricket, and increased interest in county cricket generally, led to considerable additions to the accommodation for spectators at both Lord's and the Oval.

The Government of the Metropolis

At the elections to the London County Council in 1919 (postponed during the War) 68 Municipal Reformers, 40 Progressives, one Independent and 15 Labour members were elected. At the 1922 elections the figures were—Municipal Reformers 82, Progressives 25, Labour 17; and in March 1925, Municipal Reformers 83, Labour 35, Progressives six. In contested elections only, the number voting in 1919 was 16·6% and 36·8% in 1922. For the metropolitan borough councils the figur were—27·9% in 1919 and 36·4% in 1922. For the guardian elections the results were much lower, being only 7·7% in 19 and 22·8% in 1922. In Dec. 1924 there were no contested ele tions for the court of common council of the City of London.

The boundaries of all the London Parliamentary borough were re-arranged by the Act of 1918, except those of the City London, the total number of constituencies being 61, each retur ing one member and the City two.

Finance.—The financial government of London was n modified to any important extent during the 15 years, althoug some temporary measures had to be adopted during the Wa A 1d. rate over the administrative area was estimated to pr duce £207,555 for 1924–5 on the statutory assessable value the county which was computed as £49,813,091 on April 6 192 The average rate for the area was rather over 11s., the highe figure being 23s. in Poplar and the lowest 9s. 9d. in the city Westminster. The total net debt of London on March 31 192 was given as £122,988,798, and the total charge for interest an repayment was £7,492,473. One of the principal financial obl gations left by the War was the provision of working-class dwel ings, and the net debt on these throughout the county area the year 1922–3 stood at £20,160,004, with a charge of £1,174,78 The total net debt of London has increased by about £18,000,00 since the year 1918.

The history of London during the period under review ha really been the story of the interruption of its natural growth population, extent, wealth and progress and its gradual resump tion. In 1915 the City suffered from the first hostile attack launched against it for nine centuries, and it was remarkab that in spite of persistent attempts from the air the total mate rial damage throughout the whole area amounted to less tha one-fifth of that sustained in the Great Fire of 1666, while hardl a building of historical value was injured.

Bibliography.—The best general reference is *The Subject Inde* published by the British Museum Library every five years. Th Guildhall Library has prepared a special *Catalogue of London Book* subdivided into an infinite number of subjects. For general informa tion also see *London Statistics*, published by the London Count Council, and *The Accounts of the Corporation of London*, as also th annual reports of the L.C.C. and the metropolitan boroughs. Othe books relating to London published during the 15 years include *History, The Survey of London*, published jointly by the Londo County Council and the London Survey Committee, and the publica tions of the *London Topographical* and other kindred societies See also Walter H. LONDON, CONFERENCES OF.—Five meetings of Allied statesmen for the purpose of adjusting matters arising out of the peace treaties which concluded the World War were held in London in 1921–2.

Feb. 21–March 14 1921.—The representatives of the principal Allied Powers here carried on alternately two separate sets of negotiations, one with the representatives of the Athens, Conantinople and Angora Govts. on the Near Eastern question e Turkey), and the other with the German Foreign Minister, . Simons. Both sets of negotiations were failures. A week er the conference dispersed the Greeks launched a new offen- e in their war with the Turkish Nationalists; while, a week fore the conference dispersed, sanctions were taken against ermany by the Allied military occupation of Düsseldorf, uisburg and Ruhrort, outside the area occupied under the ersailles Treaty, and by the impounding of German customs eipts and the establishment of a new customs cordon between cupied and unoccupied territory. The cause of these measures s the presentation by Dr. Simons of an unacceptable counter- oposal to the reparation demands which the Allied Govern- ents had put forward at the Paris Conference of the preceding n. 24–30 (*see* Paris, Conference of). Germany appealed ainst the Allied sanctions to the League of Nations, but the ague took no action.

April 29–May 5 1921.—Under Article 235 of the Versailles eaty, Germany was required by April 30 1921 to have made irst instalment of reparation payments in cash and kind to a al value of 20 milliard gold marks (approximately one mil- rd pounds sterling). As this period approached, it became ident to the reparation commission that Germany would be default under this head, and on April 29 the Allied statesmen, er a preliminary meeting on the 23rd and 24th at Lympne, t again in London to consider what should be done. New nctions against Germany were discussed, and an additional ss of the French Army was actually mobilised; but mean- ile, on April 27, the reparation commission had declared their imate of Germany's total liability, and the Allied statesmen ned their attention from the non-execution of Article 235 to e drawing up of a "Schedule of Payments describing the Time l Manner for securing and discharging the entire Obligation Germany for Reparation under Articles 231, 232 and 233 of e Treaty of Versailles." This document, which seems to have en drawn up by the heads of the Allied Governments, though ued in the name of the reparation commission, was sent to rlin on May 5, together with an ultimatum. Meanwhile the rman Govt. had fallen; but on May 11, one day before the imatum was due to expire, a new ministry accepted the Allies' ms with the sanction of the Reichstag.

Dec. 18–22 1921.—A meeting between Mr. Lloyd George and Briand (accompanied by M. Loucheur), in consequence of a laration by the German Govt. that it would be unable to pay two instalments next due under the schedule imposed by the imatum of May 5 1921, followed. The Prime Ministers decided call a meeting of the Supreme Council of the Allies at Cannes, l drafted, for submission to this meeting, a memorandum on reparation problem in which they proposed to grant Germany artial moratorium in exchange for an increase in the stringency Allied control over German finances. At this meeting the ntual convening of a general European conference on recon- uction was also foreshadowed (*see* Cannes, Conference of).

ug. 7–14 1922.—A meeting which arose out of the failure of rmany to carry out the schedule of reparation payments to ich she had pledged herself under duress on May 11 1921. e arrangement made between the German Govt. and the aration commission during the Cannes Conference (*q.v.*) had y postponed disaster, and since then the finances of Germany l gone from bad to worse. At the London Conference Poincaré brought forward, as conditions for granting Germany noratorium, proposals for "productive guarantees" which nad attempted to carry out next year after the Franco-Belgian itary occupation of the Ruhr. When these proposals were rred to an inter-Allied committee of experts, the French nd themselves in a minority of one, the other experts declaring t M. Poincaré's proposals would bring in diminishing returns. unter-proposals of a milder kind were put forward by the tish delegation, but as these in turn proved unacceptable to Poincaré the conference broke up without reaching a decision Reparations).

Dec. 9–11 1922.—A meeting to consider the conditions for granting a reparations moratorium to Germany, on which no agreement had been reached at the London Conference of the preceding August. At this meeting M. Poincaré again pressed his plan for "productive guarantees," which he expounded in greater detail than four months before. He made it clear that he would not consent to a moratorium without taking these pledges, which included the military occupation of the Ruhr. At the same time he countered the British plan for remitting a portion of Germany's total liability in return for the remission to France of part of her war-debt to Great Britain, by declaring that even in return for this *quid pro quo* he would only be willing to cancel "C" bonds, which were of merely nominal value. As these French terms were not acceptable to Great Britain the conference was adjourned. (A. J. T.)

LONDON, PORT OF (*see* 16.949).—On March 31 1909 the Port of London Authority became the chief body controlling the Port of London.

Before 1909, no public body had been charged with the duty of maintaining and improving the accommodation in the port. The City Corporation, Trinity House, and the Thames Conservancy had each exercised certain powers of conservancy, and the dock companies had enlarged their docks as and when it seemed profitable to them to do so. The outstanding change made by the Port of London Act of 1908 was that it set up a public body whose principal duty is to investigate the accommodation and facilities in the port and execute such works in the river and docks as are necessary to keep the Port up to a standard befitting the first port of the world. The main features of the Authority's policy have, therefore, been more concerned with the improvement of the Port than with the reorganisation of port methods and practice.

A comprehensive programme of new works was tentatively adopted in 1910. The principal works put in hand at once were:—

(*a*) the construction of a modern dock to the south of the Royal Albert Dock, 64 acres in extent with a length of quay of 12,700 ft., capable of receiving vessels of about 35,000 tons burthen.
(*b*) an extension of the Tilbury Dock.
(*c*) the rebuilding of the north quays of the East India and West India Docks.
(*d*) a river cargo jetty at Tilbury.

The World War delayed the completion of the new dock which was opened by George V. on July 8 1921. By the opening of this dock the total water area of the docks was increased to 704 acres and the length of dock quays to 156,450 feet.

Improvements.—An enormous amount of deepening and dredging of the river channels and docks has been carried out between 1909 and 1925. During 1924–5 alone, 3,897,000 cu. yd. of material were removed from the river, and the quantity of mud removed from the docks was 1,206,000 cubic yards. The result of the deepening operations in the river is that for the greater part of the 25 m. below Tilbury and for the 10 m. above Tilbury, the channel at low water had, in 1925, a minimum depth of 30 ft. with a width of over 1,000 feet. For the remaining 6 m. up to the King George V. Dock, the width of the channel is maintained at 600 ft., with a minimum low water depth of about 27 feet. At high water, these channels are wider, while the depths are from 17 to 21 ft. greater. The new works in hand in 1925 included a new dock in the Surrey Commercial system. Preparations were well advanced for a new dry dock, a new river entrance, and a passenger landing stage at Tilbury. Up to March 31 1925 the sum spent on new works by the Port Authority approximated £11,000,000.

Value of the Port Shipping.—The amount of merchant shipping entering and leaving the port was affected by the War, especially during 1918, when the tonnage was only 14,564,000 tons as compared with 40,080,000 tons in 1913. Since 1918, recovery has rapidly taken place, the figure for 1924 being 45,393,000. The total value of the overseas trade of the port for 1924 was £677,342,000, compared with £582,464,000 at Liverpool and £121,186,000 at Hull. Though the Port of London Authority provides most of the accommodation in the port, there is an important system of private riverside wharves and warehouses, where small vessels are discharged and warehousing business is carried on in competition with the Authority. Recent developments in the river below Barking Creek favour the establishment of industrial enterprises which expect to benefit by their easy access to Thames port facilities.

There have been several labour disputes in the port during the period 1910-25. A general strike for higher wages took place in the summer of 1911; a more serious strike occurred in 1912, when the question at issue was the employment of non-union labour. During the War, labour was comparatively quiescent, threats of trouble being averted by concessions of higher wages to meet the increased cost of living. Another strike took place in 1924, in resistance of a reduction of wages previously agreed upon. The minimum rate of pay in the port in 1925 was 12^s per day. The organisation of labour in the port has greatly improved since 1910. The administration of the port by the Authority may, on the whole, be regarded as successful. Dock charges are doubtless higher than they would have been had the dock companies not been dispossessed, but compensation for this is found in the more comprehensive treatment of port problems under the management of a body in which the traders using the port are in a majority. (J. G. B.)

LONDON, UNIVERSITY OF (*see* 27.772).—London University has problems which are directly related to its dual nature and to its immediate history. The first attempt to found a university in London was made by Sir Thomas Gresham in 1548 when seven professorships—divinity, music, physic, astronomy, geometry, law and rhetoric were endowed, but this project never attained full fruition. In 1825 Thomas Campbell, the poet, addressed a public letter to Brougham, as a result of which University College came into being and opened classes in 1828 in arts, law and medicine.

Creation by Charter.—On Nov. 28 1836 the University of London and University College, respectively, received charters. The university was constituted an examining body, while University and King's Colleges were constituted the teaching centres. The university was thus created as an examining body and as such undoubtedly achieved a great reputation for impartiality, thoroughness and high standard, so great being its prestige in medicine and surgery in particular that its degrees were and still are sought after even in preference to those of older universities, especially by students from the Dominions.

Teaching University Established.—The Cowper Commission (1894) submitted a report in 1894, embodied in the University Act of 1898, which forms the present constitution of the university. In accordance with statutes approved by Parliament in 1900, the teaching colleges were federated with the university but were not subject to any financial control. Indeed, the authority of the university is limited to the recognition, or refusal of recognition, as teachers of the university, of teachers in the colleges and to the approval of courses of study. Thus a dual university was established, combining the functions of examination with the functions of teaching in its federated schools.

All affairs appertaining to the teaching institutions of the university fall under the administration of the Academic Council, which reports directly to the Senate. This section of the university has become known as the internal side. All other functions not to do with teaching, which had been performed by the old examining body, fall under the administration of the Council for External Students which also reports directly to the Senate. This section of the work of the university is known as the external side, and the degrees granted to students examined by this body, but not taught necessarily in the schools of the university, are called external degrees. The Senate remains the executive authority to accept, to modify, or to reject as it wills the recommendations coming from these two great statutory councils thus constituted.

The Senate.—The Senate, as the executive and co-ordinating body, comprises three nearly equal sections. One represents the teaching or academic side (16 representatives chosen by the faculties), one represents the external side (16 representatives
chosen by the graduates constituting Convocation) and a t
section of 21 members consists of representatives chosen by
Crown and other outside electing bodies. The chancellor
chairman of Convocation, who are elected by the whole bod
Convocation, complete a Senate of 55 members. The th
section named above acts in some sense as a jury between
equal bodies representing the academic and external intere
Practically all the business of the university is conducted
committees. The Senate exercises its important functions
reception of reports from these committees, and has proved
practice a remarkably efficient instrument.

Incorporation of Colleges.—In 1905 University College
incorporated with the university. This was followed in 1908
the incorporation of King's College. The effect of incorporat
is difficult to estimate. Nominally the colleges are under
control of the university; in fact they are very largely in
pendent of that control. No other school has wished to sec
incorporation, while King's College has expressed the desire
cancel incorporation if this should be possible.

Royal Commission.—In 1909 a Royal Commission, over wh
Lord Haldane presided, was appointed with wide terms of re
ence and after taking evidence published its report in 19
The following significant remark was made by a commissio
on the first day of taking evidence:—

> My point is this: What is the use of a royal commission or
> other body attempting to organise university teaching, and
> elevate it and to enhance the value of the degree if the exter
> degree remains, if unrecognised colleges are doing as good work
> the recognised ones?

The Commission made recommendations which would res
in the complete extinction of external degrees in the more
less near future.

The Commission further recommended the constitution o
Senate of 15 members of whom two only were to be representati
of the teachers with one representative of graduates of Convo
tion, while the 12 others were to be appointed variously but
such a manner as to ensure bureaucratic control of the unive
ity. These drastic proposals met with very little public appro
and lapsed during the War. However, a departmental co
mittee was appointed by the Board of Education in 1924, wh
Lord Haldane was Lord Chancellor in the Ministry of
Ramsay MacDonald, for the purpose of preparing statutes
legislative approval to give effect to the recommendations
the Royal Commission. Vigorous protests have been ma
against the constitution of the departmental Committee.[1]

Progress and Development.—Notwithstanding the disturba
inseparable from these repeated Commissions, the univers
under its present constitution has prospered exceedingly. Si
1915, roughly speaking, the internal side has trebled and
external side doubled in the number of students. Inasmuch as
internal side started from zero it has naturally progressed a
greater pace than the external side. Twenty-five colleges ha
sought and obtained recognition as "Schools of the Universit
Faithful to its tradition of far-seeing initiative, the univers
has founded degrees in commerce, which have already prove
most notable success. New chairs have been founded—larg
by private munificence—in response to the ever-increasing co
plexity of modern science and industry. Research in every fi
of scholarship and science is sedulously encouraged. The u
versity library has been developed and improved.

More recently the university has solved the very difficult pr
lem of its relation with the Imperial College of Science and Te
nology. This college had long nursed the ambition to form
technological university giving its own degrees. It has no
by the adjustment of certain examinations, accepted who
heartedly the position of a "School of the University." T

---

[1] The committee recommend—*inter alia*—the creation of a Cou
cil of the University to control finance, and of a Collegiate Coun
composed of members of the Senate. To give effect to these reco
mendations, which have been vigorously criticised, legislation will
required. Some financial control is unavoidable if co-ordination is
be secured, and to effect this without discouraging prospective or
noying actual benefactors will not be easy. (Ed. *E. B.*)

·eat medical schools with their splendid traditions, so much der than the university itself, have accepted the system of the ɔpointment of their professorial teachers by the university.

Very significant is the change that has taken place in the ·lations between the internal and the external sides. The :ternal side, threatened with extermination, was placed upon s defence, and a perfectly unnecessary feud between external ıd internal interests became thus accentuated. With the creasing prospect that the commission's report would never : carried into effect hostilities died down and when the Hal- ıne recommendations were revived by the appointment of the :partmental committee the two sides of the university joined a united protest which was submitted to the departmental ɔmmittee in an identical memorandum prepared by the aca- :mic and the external council respectively.

The secret of the increasing confidence of the schools in the ıiversity central administration is to be found in the lightness ıd tactfulness of the control exercised by that administration. he colleges are free institutions, voluntarily submitting to ıidance and leadership, but retaining essential independence. ny attempt to substitute for this system an encroachment ɔon the liberties of these federal institutions would spell saster.

The university has become the largest university in the :itish Empire. Indeed, it is an increasingly important link of tachment, for it accepts students from every part of it on terms :tirely equal. It still holds out an ever more helpful hand to e poor student unable to obtain a collegiate education. At e same time the number of its collegiate students, multiplied reefold in 10 years, testifies to the confidence which academic ɔdies repose in it. It continues to attract to its governing body en distinguished in every walk of life. (E. G. L.)

LONDONDERRY, CHARLES STEWART HENRY VANE-TEM-EST-STEWART, 7TH MARQUESS OF (1878–1915), British poli- :ian, was born in London May 13 1878. Educated at Eton and ındhurst, he entered the House of Commons in 1906 as Unionist ember for Maidstone. From 1914–9 he served in the World ar, being twice mentioned in despatches. Made a privy coun- lor for Ireland in 1918 and a K.G. in 1919, in 1920–1 he was der-secretary for air, and in June 1921 took office as Minister Education for Northern Ireland. From this position he signed Jan. 6 1926 and was succeeded by Viscount Charlemont.

His father, Charles Stewart Vane-Tempest-Stewart, the 6th ırquess (1852–1915) (*see* 16.969), was a prominent leader of : opposition to the Home Rule Bill of 1912 and was one of the st to sign the Ulster Covenant, Sept. 28 1912. He died at vnyard Park, Stockton-on-Tees, Feb. 8 1915.

LONG, WALTER HUME LONG, 1ST VISCOUNT (1854–1924), glish politician, born at Bath July 13 1854, was the eldest ı of Richard Penruddocke Long, of Rood Ashton, Wilts., and wife Charlotte, daughter of Fitzwilliam Hume Dick. He s educated at Harrow and Christ Church, Oxford. Being the r of an old county family with a tradition of Parliamentary vice, it was natural that he should contemplate a political eer. He entered Parliament in 1880 as Conservative member North Wilts, and sat in every House of Commons till he was ated a peer in May 1921, though he changed his constituency eral times. He obtained office early, and showed administra- e power and common sense in positions agreeable to a capable intry gentleman—Parliamentary Secretary to the Local vernment Board 1886–92, President of the Board of Agri- ture 1895–1900 and President of the Local Government ard 1900–5. His administration at the Board of Agricul- e was marked by the stamping out of hydrophobia through strict enforcement of a muzzling order for dogs; and the acity and resolution which he showed in carrying his policy ough, in the face of a violent agitation by many dog owners l dog lovers, raised him greatly in public esteem.

n March 1905 Mr. Long was chosen by Mr. Balfour to suc- l Mr. Wyndham, after the latter's breach with Irish Union- , as Chief Secretary for Ireland. He at once restored Unionist fidence by reducing the under-secretary Sir Anthony (afterwards Lord) MacDonnell, to definite subordination to himself as the responsible minister, and by the firmness with which he proceeded to enforce the law and repress agrarian intimidation. The impression which he produced in Ireland in the few months before Mr. Balfour's resignation was so considerable that he, an Englishman, was returned to Parliament in the general election of 1906 for a Dublin seat. In the years of opposition which followed he proved a vigorous opponent of Mr. Birrell's policy of *laissez-faire* in Ireland and of Mr. Lloyd George's proposals with regard to the land; and a more benevolent critic of the Government Old Age Pension scheme and of Mr. Burns's administration at the Local Government Board. When Mr. Balfour resigned the leadership of the Conservative party in Nov. 1911 he was the candidate of the more conservative branch of the party; but both he and his rival, Mr. Austen Chamberlain, agreed to stand aside in favour of Mr. Bonar Law.

With the other conservative leaders he joined the first Coalition Ministry in 1915, returning to his old post of President of the Local Government Board; and in the second Coalition Ministry (1916) he was Colonial Secretary. He had been hitherto a decided opponent of woman suffrage, but, along with Mr. Asquith and others, he was converted by the services of women during the World War, and in 1917 he introduced in the House of Commons the Franchise Bill, which became law in the following year, and under which women over 30 obtained the vote. When Mr. Lloyd George reconstructed his Ministry in the beginning of 1919 Mr. Long became First Lord of the Admiralty and had the difficult task of supervising the reduction to a peace basis of the gigantic navy which had been built up during the War. For some years his health had been periodically unsatisfactory, and in the spring of 1921 he resigned office. Mr. Bonar Law's break-down in health occurred almost immediately afterwards, and Mr. Long heartily supported the election of his old rival Mr. Austen Chamberlain to the leadership of the Conservative party. A few months later he was raised to the House of Lords, amid general approval, as Viscount Long of Wraxall. He did not hold office in either Mr. Bonar Law's or Mr. Baldwin's Government, and died Sept. 26 1924 at Rood Ashton, Wiltshire. He had married in 1878 Lady Doreen Boyle, daughter of the 9th Earl of Cork. His elder son, Brig.-Gen. Walter Long, C.M.G., D.S.O., fell in action Jan. 27 1917, and Lord Long was therefore succeeded in the peerage by his young grandson. (G. E. B.)

LONG, JOHN DAVIS (1838–1915), American lawyer and politician (*see* 16.974), died at Hingham, Mass., Aug. 28 1915.

LOOS, BATTLE OF, was fought between the British and German Armies, Sept. 25–8 1915. The British offensives in the spring of 1915 at Neuve Chapelle, Aubers and Festubert, and the French offensive against the Lorette ridge, made only small gains, at heavy cost, and by July the Arras front was again stabilised. A stalemate ruled on the Western Front for the rest of the summer.

Plans of French Headquarters.—Despite the non-success of their spring offensive, French Headquarters were not disposed to relinquish all efforts to break through the German lines in France until such time as the British could attack on a great scale. It was desirable to do something in the West to relieve the situation in Russia, which was steadily growing worse. Accordingly, Gen. Joffre laid his plans for a big effort in Champagne to be combined with a Franco-British attack in Artois, the French X. Army attacking the Vimy ridge, the British I. Army between Lens and the La Bassée canal. If both succeeded it was hoped to establish touch between them east of Lens, which was to be "pinched out," not attacked direct, and should this coincide with a real break-through in Champagne there might be a chance of intercepting the Germans in the great salient between Soissons and Arras.

Composition of British Force.—The British share was to be on a far larger scale than in May; for the main attack nine divisions were available, six others were to contribute by creating diversions elsewhere. Careful economy in ammunition and the greatly increased output from the factories at home had allowed the accumulation of a fair supply of shells, and the enemy's own weapon, gas, was to be employed. It was hoped that by using gas it would be possible to attack on a really wide front, much more extensive than would have been possible if the bombardment by the artillery had been the sole means of preparing for the assault.

To the main attack three corps were allotted: on the right, Sir H. Rawlinson's IV. Corps attacked from Loos to Hulluch; Sir H. Gough's I. Corps, on the left, making for the line Hulluch-Haisnes-Auchy. On both wings defensive flanks were to be formed under cover, of which the central divisions would push on towards the Haute-Deule canal, cross it at Pont à Vendin, and connect up with Foch's troops. The cavalry and the newly formed XI. Corps (Sir R. Haking), which included the Guards, making their début as a division, and the newly arrived 21st and 24th Divs., would support this advance.

Assault on German Front Line.—Four days' bombardment, of an intensity as yet unknown, preceded the assault, which was launched at 6.30 A.M. on Sept. 25. The bombardment was as effective as the limited amount of ammunition allowed, and the Germans' deep dug-outs greatly reduced its results by sheltering the trench garrisons, while unluckily the wind practically failed and the gas therefore proved a great disappointment. This was all the more serious because the artillery had been unable to do as much damage all over the wide front attacked as they had accomplished at Neuve Chapelle on the narrow frontage then attacked. However, over most of the front the wire had been well cut and the attackers carried the German front system and swept on towards their second set of trenches, about a mile in rear. On the extreme right the 47th Div. successfully established a defensive flank connecting their old line with Loos, which was reached and carried by the Scots of the 15th Division. The 15th's left, however, was exposed by the failure of the 1st Div's. right brigade, which found a long stretch of uncut wire covering trenches at Lone Tree, so that the left brigade which got in and penetrated to Hulluch, though after heavy losses, found its right uncovered and could not maintain its advanced position. The 7th Div., on the right of the I. Corps, carried its first objective after heavy fighting but could not pierce the German second system of defences in front of Cité St. Elie. On its left the 9th (Scottish) Div. took the Hohenzollern redoubt and Fosse 8, and a detachment reached the German second system but in insufficient strength to break through. The left division, the 2nd, attacking astride the La Bassée canal failed to take its objective.

Results of the Attack.—The attack had resulted in the capture of a long stretch of the German front line with 20 guns and many prisoners; losses, however, had been heavy, and though at several points the second system had been reached there was no touch between the different parties. These, moreover, had pushed beyond the range of effective artillery support, while neither Gough nor Rawlinson had sufficient reserves in hand to link up the different advanced parties; the XI. Corps was too far back to reach the front in time and the check to the 1st Div. at Lone Tree left the 15th's flank dangerously uncovered. As at Neuve Chapelle, there was an opening but there were delays. The Germans threw in their reserves, drove the advanced troops of the 15th Div. back to Hill 70, just east of Loos, ousted those of the 1st from Hulluch, got in after nightfall between the 7th and the 9th, and retook some quarries west of Cité St. Elie and made the 9th's centre recoil to Fosse 8. But at no point could they regain their old front line and they had to pay heavily for the ground they regained.

Second Attack.—On Sept. 26 an effort was made to break through between Hulluch and Loos, using the two "New Army" divisions of the XI. Corps. But the Germans were pressing so hard at the Hohenzollern redoubt and on Hill 70 that two brigades had to be diverted to those points, and the advance of the main bodies was greatly retarded by the congestion of the roads with transport, and other unforeseen delays. They could not reach their assigned position in time, and before the attack could be started a German counter-attack recaptured Bois Hugo, midway between Hulluch and Loos.
This point had been reached by the right of the 1st Div. lat
the previous evening, the dislodgment of the Germans at L
Tree having at last let it get forward but too late to do m
consolidation or link up with its left brigade at Hulluch or
the 15th Div. at Hill 70. Early in the morning a brigade of
21st Div. had taken over Bois Hugo but had barely don
before the counter-attack dislodged it. Moreover, the Bri
guns had been unable to register the German second line
fences and the bombardment of them was ineffective. The
Div. pushed forward across the Lens-La Bassée road but
enfiladed from Bois Hugo by machine-guns, found the Gerr
wire and defences practically intact, and fell back in s
disorder. The 21st Div. had already done the same after fai
to retake Bois Hugo, and the greater part of Hill 70 passed b
into German keeping, the defences being outflanked from
north as well as attacked in front. The I. Corps, too f
occupied in holding its ground, could make no progress.

Unsatisfactory Result.—By the evening of Sept. 28 the cha
of a break-through was gone. On Sept. 27 the Guards
regained much lost ground on Hill 70 and secured a better
from Bois Hugo to Hulluch, but this merely improved the
tical situation at an awkward point. Elsewhere, German p
sure was heavy, especially against the I. Corps. Fosse 8
lost and efforts to retake the quarries failed, and though
several days a hold was with great difficulty maintained on
Hohenzollern redoubt it, too, was lost on Oct. 3. Howe
a big German counter-attack on Oct. 8 all the way round f
Loos to the Hohenzollern, was decisively repulsed, and
days later the 46th (N. Midland T.F.) Div. covered par
the Hohenzollern, and the 12th (Eastern) Div. considera
improved the position nearer Cité St. Elie. This was the
attack on any large scale; the position in the salient which
been driven into the German lines gradually quieted down
before the end of Oct. had become as thoroughly stabilise
any other part of the fronts.

Long before the fighting on the British front had relapsed
normal "trench warfare" the French had abandoned t
Artois offensive. The German front line was cheaply ca
(Sept. 25), but though for some hours the German defences
the Vimy ridge were only scantily manned the French faile
reach them in time. Their plan of limiting their object
strictly meant that what they took they secured but it me
also delays in reaching the more distant objectives. By S
27 reserves had filled the gap and brought the French to a sta
still, Vimy remaining in German hands.

Thus, Loos, like Neuve Chapelle and the May offensive,
failed to produce any change in the strategical situation,
tactical gains made had been dearly bought and no really
stantial relief had been given to the Russians. Still, the
mans also had lost heavily, and the experience gained in
planning of so large an attack, far the biggest operation as
attempted by the British Army, had been most valuable.
Loos it had been attempted to apply the lessons and to a
the errors of Neuve Chapelle. There, chances had been
through over-deliberation and rigidity, through waiting
others were up level, so that all might go forward together
Loos, pushing on too deep, regardless of what others were do
had occasioned overrunning and ultimately losing posit
which greater deliberation might have secured. But
showed the Germans that the "New Army" divisions we
factor with which they must reckon seriously, that when
whole of the "New Armies" were in the field a great Bri
offensive would be a formidable danger.

See J. Ewing, *The History of the 9th (Scottish) Division, 191*
(1921); also *see* WORLD WAR: BIBLIOGRAPHY. (C. T. A

LOREBURN, ROBERT THRESHIE REID, 1ST EARL (18
1923), British lawyer and politician, was born at Corfu Ap
1846, and was educated at Cheltenham and Balliol Coll
Oxford, where he had a distinguished career, winning the Irel
scholarship in 1868. He was called to the bar in 1871, an
1880 entered politics as Liberal member for Hereford. In
he became a Q.C. and, having in 1885 lost his seat at Heref

ıs returned in 1886 for Dumfries Burghs, retaining the seat ıtil 1905. In 1894 he was for a few months Solicitor-General ıd was knighted, and during 1894–5 was Attorney-General. He ceived the G.C.M.G. in 1899, and from that year until 1906 he ıs counsel to the University of Oxford. On the formation of r Henry Campbell-Bannerman's Govt. in 1905, Sir Robert eid became Lord Chancellor, and was raised to the peerage as ıron Loreburn. To him, while Chancellor, the passage of the ourt of Criminal Appeal Act (1907) was largely due. In 1912 resigned on grounds of health. Lord Loreburn, who was eated an earl in July 1911, published *Capture at Sea* (1913) ıd *How the War Came* (1919). He died without issue Nov. 30 ı23, when the title became extinct.

LORENTZ, HENDRIK ANTOON (1853–   ), Dutch physicist, ıs born at Arnheim July 18 1853. In 1878 he was appointed a ofessor in the University of Leyden, a post which he held until ı23. From 1883 to 1895 he worked upon his electron theory ıd in 1892 published his *Théorie électromagnétique de Maxwell son application aux corps mouvants*. This was followed in 1895 the famous treatise *Versuch einer Theorie der elektrischen und tischen Erscheinungen in bewegten Körpern*. In 1909 appeared s *Theory of Electrons and its Application to the Phenomena Light and Heat*, which gives the résumé of Lorentz's researches ıd contains the lectures he delivered in New York in 1906. In ı02 he was awarded, with Pieter Zeeman, the Nobel Prize r physics. Among his other works may be mentioned *Text Book the Differential and Integral Calculus* (1882; German ed., 1900); *isible and Invisible Movements* (1901); *Abhandlungen über eoretische Physik* (1907); *The Einstein Theory of Relativity: Concise Statement* (1920); *Clerk Maxwell's Electromagnetic heory* (1924). From 1919 his lectures for the university courses ere published, under his personal supervision, with the title of *ssons on Theoretical Physics*, eight volumes of which had opeared in 1925.

LORENZ, ADOLF (1854–   ), Austrian surgeon, was born at idnava, Silesia, April 21 1854, of poor parents. He entered ienna University and studied surgery under Billroth, Nicoladini ıd Eduard Albert, afterwards becoming a demonstrator, and en a professor at the university. His best known studies are ose relating to club-foot and flat-foot. He published numerous udies on his special subjects, the most important being *Die hre vom ererbten Plattfusse* and *Ueber die operative Orthopädie s Klumpfusses*. Lorenz also invented the *deutsches Gipsbett* hich proved to be a great advance on Bradford's plaster beds hich had previously been in general use.

LORIMER, GEORGE HORACE (1868–   ), American editor, ıs born at Louisville, Ky., Oct. 6 1868. His early education ıs received at the Mosely High School, Chicago, whence he oceeded to Colby (Me.) and Yale universities. After being r a short time in business in Chicago, he turned to journalism, coming a reporter and correspondent on several newspapers. 1897 he became literary editor of *The Saturday Evening Post*, d in 1899 was made editor-in-chief. The remarkable success this periodical can be attributed in no small measure to Mr. rimer's keen appreciation of the public taste coupled with his ility to meet it. He adopted the policy of selling *The Saturday ening Post* at a price (5 cents) much below the cost of manucture, and thereby securing a circulation that made its pages extremely attractive advertising medium. He wrote *Letters om a Self-Made Merchant to His Son* (1902), which achieved eat popularity; *Old Gorgon Graham* (1904); *The False Gods* 906); *Jack Spurlock Prodigal* (1908).

LORRAINE, EARLY OPERATIONS IN: *see* FRONTIERS, BAT-ES OF THE.

LOS ANGELES, Cal., U.S.A. (*see* 17.12), had, at the end of 1925, population estimated at over a million and an area of 421·71 . miles. The population within the city limits increased from 9,198 in 1910 to 576,673 in 1920. There were 15,579 negroes, ,230 Japanese, Chinese and Indians and 112,057 foreign-born ıites. About 1920 began an influx of population to southern alifornia which surpassed even the movement of earlier years. ecause of its geographical position and the embryonic state of most of its industries, Los Angeles had no war-time inflation and consequently escaped the experience of post-War deflation. On the contrary, the influx of population and the discovery, at almost the same time, of rich new oil-fields in the vicinity, caused a "boom" which lasted through the first quarter of 1924, reaching its greatest intensity in 1923. Business generally fell off in 1924, and in the first half of 1925 an actual decrease of population was discernible, but this was more than made up by gains in the last six months of the year.

Communications.—In 1919 only six steamship lines made the port of Los Angeles regularly. In 1925 there were 60 lines handling general cargo, 35 tank lines and 35 lumber lines. The total number of ship arrivals in the year ending June 30 1925 was 5,901. The harbour had, at the end of 1925, 10 m. of wharves (6 m. owned and operated by the city) and more than 50 m. of municipal harbour belt-line railway tracks; the channels and basin in the inner harbour had a depth of 30 ft. at low tide; in the outer harbour, at more than a mile of wharfage, of 35 ft.; the main channel had been doubled in width, to 1,000 feet. The electric railways in 1925 operated over 1,508 m. of track, extending to a radius of 75 m. outside the city. A one-mile subway and a terminal building, constructed 1924–6, greatly improved the service between important residential sections and the business district.

Commerce.—Within a few years after the close of the World War the commerce of the port of Los Angeles rose to more than that of any other ocean port in America except New York. The total tonnage (imports, exports, coastwise and inter-coastal) was 2,380,622 short tons in the year 1918–9, 26,550,464 in 1923–4 and 22,268,421 in 1924–5, with a value respectively of $86,481,470, $643,221,303 and $671,406,570. Exports to foreign countries amounted to about $75,000,000 in 1925; imports from foreign countries, to about $35,000,000. The increase was due partly to the demand for lumber (most of it from British Columbia) and other building materials, and for crude rubber, but chiefly to the great increase in the production of oil. It was at first piped out through the harbour in a crude form. With the development of refineries a larger part of it (by 1924) was shipped in a refined state. Great Britain was the principal market for gasolene (162,615,222 gal. in the year 1924–5); China for kerosene; Chile for fuel oil.

Industries.—Between 1910–9 Los Angeles became an important industrial centre, and after 1919 its manufactures grew fully as fast as its population. Factory products, within the city limits, were valued at $68,586,000 in 1909; $278,184,000 in 1919; $313,589,985 in 1921; $417,654,081 in 1923. The Federal census of manufactures, however, limited to factory products, does not include motion-picture films, which until 1924 were the city's most valuable product, or such commodities as manufactured gas; and it does not include any plants outside the city limits. Tabulations by the Chamber of Commerce, including all manufactured products, give the following figures for the metropolitan area: (1919) $618,772,000; (1921) $800,926,641; (1923) $1,151,643,537; (1924) $1,202,677,004. The leading industries in 1924, with the value of their products, were petroleum products, $221,880,293; motion-picture films, $168,000,000 (estimated to be 75% of all produced in the U.S.); iron and steel machinery, $99,117,430; meat products, $67,987,146; lumber and planing-mill products, $64,327,685. Petroleum products occupied the leading position for the first time in 1924, having increased steadily each year from $83,867,716 in 1919.

Water and Power.—The Los Angeles aqueduct, 250 m. long, bringing water from the Owens river in the Sierras, in amounts to supply a population of 2,000,000, was placed in service in 1913. In the process of extending the city service to the vast new areas which had been annexed, new water mains were installed at the rate of over one mile a day during the year ending Sept. 1 1925, bringing the total in service to 2,654 miles. To provide for anticipated needs in the future, plans were already well advanced for constructing a still longer and larger aqueduct to bring water sufficient for a population of 7,500,000 from the Colorado river. A bond issue of $2,000,000 was authorised June 2 1925, to begin preliminary work and acquire the necessary rights of way. The Bureau of Power and Light (established 1909), owned and operated, by 1925, five hydroelectric power generating plants along the line of the aqueduct, producing a total of 110,000 h.p., which furnished 60% of the total amount of energy distributed by the bureau, the other 40% being purchased wholesale from a private corporation.

Public Buildings and Improvements.—A fine Hall of Justice was completed in Dec. 1925, including a county jail to replace the one constructed in 1902. In 1925 plans had been accepted and a site chosen for a new city hall; a new public library was approaching completion (cost $2,000,000); the first unit of the $12,000,000 project for a county museum was completed; also the Coliseum (seating capacity, 77,000) built by the city and county jointly; and the Patriotic Hall, built by the county as a memorial to the soldiers and sailors of the country's wars. A city-planning commission was set up in 1910. By 1925 the city had a plan covering its entire area, and including zoning provisions, major and minor highway system, park, boulevard and channel parkway system.

Education.—The public-school system included (Nov. 1925) 234 elementary schools, 11 special schools, 14 junior and 23 senior high schools, with 7,495 teachers. The University of Southern California (enrolment 12,007 in 1924–5) established about 1920 an extension division known as the Metropolitan University, which had an enrolment of 4,900 in the autumn of 1925.

Government.—A new charter, adopted in 1924 and operative from July 1 1925, provides for the initiative, the referendum, the recall and an executive budget. The mayor (the chief executive, with wide appointive powers), the city attorney, the controller and the seven members of the Board of Education are elected at large. The 15 members of the council (the legislative body) are elected by districts. The principal functions of government are entrusted to 16 commissions of five members each, appointed by the mayor and serving without salary, which in turn appoint and fix the salary of general managers for their respective departments.

LOSSKI, NIKOLAI ONUFRIEVICH (1870–), Russian philosopher, was born at Kreslavka, Vitebsk province. He was educated at Kreslavka and at the University of St. Petersburg (Leningrad) where he studied first science and then philology. From 1916 to 1921 he was professor of the same university, but in 1922 he was compelled to leave Russia and went to live in Prague. Losski is the representative of intuitionalism in epistemology. According to his views, knowledge is immediate contemplation (intuition). His intuitionalism differs from Bergson's in so far as he considers the ideal-rational forms to be elements of realities, intuitively cognisable. His kind of intuitionalism leads to concrete ideal-realism, his idealism being as concrete as realism. He assumes not only concrete real being, but concrete ideal being as well, *i.e.*, supra-temporal and supra-spatial substantial agents with creative force, which are the basis of spatio-temporal being. Abstract ideas obtain their significance and importance exclusively from the substantial agents, who create the real according to constitutive abstract ideas (*e.g.*, mathematical principles) and normative abstract ideas (*e.g.*, moral ideas, etc.). The doctrine of the creative force and superqualitativeness of substantial agents leads Losski to his teaching of the freedom of the will.

Among Losski's most important books are *Die Grundlehre der Psychologie vom Standpunkte des Voluntarismus*, published in Russian (1903), in German (1905); *The Intuitive Bases of Knowledge* (1904; Eng. trans., 1919); and *Handbuch der Logik* (1922), in German (1926). The titles of his untranslated Russian works may be given in English as follows: *Introduction to Philosophy; The World as an Organic Whole; Principles of Epistemology; Matter and Life; Freedom of Will.*

LOUCHEUR, LOUIS (1872–), French politician, was born at Roubaix Aug. 12 1872. After studying at the École Polytechnique he embarked upon a highly successful career as an engineer and contractor. Both in France and abroad he gradually developed an extensive business, and the advent of the World War with its necessities gave fresh prosperity to those industries concerned with the manufacture of arms and munitions. When in Dec. 1916 M. Briand decided to give certain offices to non-political men of high technical ability, he called upon M. Loucheur to be an under-secretary of state. In the Cabinet formed by M. Clemenceau in 1917, which lasted until Jan. 1920, he was Minister of Munitions. After entering Parliament in Nov. 1919 as deputy for the Nord Department, he became Minister for the Liberated Regions in the Briand Cabinet, Jan. 1921. In that capacity he negotiated with the German Minister of Reconstruction, Herr Walter Rathenau, the Wiesbaden Convention for facilitating payment in kind of part of the Reparations. During the two years which ensued, M. Loucheur distinguished himself by upholding before the Chamber, with great argumentative ingenuity, various schemes for remedying the financial situation. On Nov. 28 1925 M. Briand appointed him Minister of Finance in his new Cabinet. But he found every group in Parliament violently hostile to the seven proposals which he submitted for alleviating the financial crisis. The Finance Commission of the Chamber twice rejected five of these proposals and he therefore resigned Dec. 15, having held his portfolio exactly 17 days.

LOUIS III., ex-King of Bavaria (1845–1921), was born Jan. 7 1845 and assumed the regency in succession to his father (*see* 3.550) on Dec. 12 1912. In accordance with the bill passed by Bavarian diet he assumed the crown on Nov. 5 1913.[1] Af the proclamation of the republic on Nov. 7 1918, the King, w the Queen and his daughters, left Munich. The royal fam resided first at Berchtesgaden, and afterwards at a cas assigned to them on the shores of Chiem See. On Nov. 13 formally signed his abdication, and relieved all Bavarian offici officers and soldiers from their oath of allegiance. He died Sarvar, Hungary, Oct. 17 1921.

LOUISIANA (*see* 17.53).—The population of the state as es mated in 1926 was 1,918,591, compared with a census enume tion of 1,798,509 in 1920 and of 1,656,388 in 1910. Duri 1910–20 the negro population decreased from 713,874 to 700,2 or from 43·1 to 38·9% of the total. The population of New leans, the principal city, was estimated on July 1 1924 at 409,5 compared with a census enumeration of 387,219 in 1920 and 339,075 in 1910.

Agriculture.—The most important industry of the state h always been agriculture. The total value of all farm crops in 19 as reported by the Bureau of the Census was $231,506,000. T total number of farms in 1920 was 135,463, representing a gain 14,917 during the decade, but a slight decrease occurred in t following four years, there being 132,451 in 1925. Corn, cotto sugar-cane, rice and hay, in the order named, constituted t most important field crops. The boll weevil temporarily caus a sharp decline in the production of cotton, but with bett methods of combatting this pest and the stimulus of high pric the yield increased from 279,000 bales in 1921 to 501,523 bal in 1924. Another effect of the boll weevil has been the tre toward more diversified farming, with a consequent increase the yield of maize (Indian corn) which reached the maximu of 35,022,000 bu. in 1921. The yield in bushels in subseque years was as follows: 1922, 29,002,000; 1923, 24,702,000; 192 18,998,000. This decline was a result of low prices in this peri as compared with the price of cotton, which made the latter t more profitable crop. The livestock industry also gained in i portance as a result of this diversification, although the state 1924 still ranked only thirty-fourth in the value of livestock the farms. Louisiana leads all other states in the production rice, the yield over a period of years averaging nearly half t total raised in the United States. The crop of 1924 amounted 17,078,000 bu., with a value of $23,226,000. Practically all t cane sugar produced in the United States comes from Louisian The trucking industry has acquired considerable importance the vicinity of New Orleans, and the raising of strawberri has proved profitable on the cut-over pine lands of Livingst and Tangipahoa parishes. Citrus fruits are grown in considerab quantity along the Mississippi river below New Orleans.

Manufacturing.—The value of manufactured products, at fa tory prices, in 1923 was $624,682,620, a gain of 30·4% as co pared with 1921. The average number of wage-earners employ in factories during 1923 was 94,597, a gain of 11·1% over 192 The production of lumber and timber products is the leadi manufacturing industry of the state, both in respect to value products and number of persons employed. The total value lumber and timber produced in 1923 was $132,682,000, an i crease of 44·3% over 1921. Petroleum refining came second 1923 in value of products, with a total output valued at $102,40 962, representing a gain of 8·6% over 1921. Sugar refining ca third, with products in 1923 valued at $88,151,711 and showing gain of 66% over 1921, when the sugar industry was sufferi from severe depression. In spite of the increase in tariff duti on sugar in 1922 the Louisiana sugar industry is at a disadva tage in competing with tropical countries that are free from t hazard of frost and also enjoy the advantage of cheaper labou The number of sugar factories in the state decreased from 124 1921 to 82 in 1924. In 1924 many of these establishments shift from the manufacture of raw sugar to the production of syru the output of which amounted to 9,920,000 gal., compared wi 6,718,000 gal. in 1923.

---

[1] King Otto, who had been kept in confinement as a lunatic, di on Oct. 11 1916.

Minerals.—Until 1924 Louisiana led all other states in the pro- ction of sulphur, but late in that year production in Calcasieu rish was suspended because of the exhaustion of the deposit. ıis came after 25 years of production with a total yield of about ,000,000 tons of sulphur. It was this deposit which made the ıited States the chief sulphur-producing country in the world, d the Louisiana product virtually displaced Sicilian sulphur, ıich at one time held first place in the world's markets. In 1923 uisiana ranked third in the production of rock salt and fifth that of all salt. The output in that year was 359,000 tons, mpared with 265,000 tons in 1920. The rock-salt deposits lie the extreme southern portion of the state, and yield a product unusual purity. Most of the petroleum produced in the state mes from the parishes of Caddo, Red River, De Soto and Clai- rne. The state's output in 1924 was 21,124,000 barrels. The cord output of 35,714,000 bbl. was attained in 1920 after the ening of the great Homer pool in Claiborne parish. Some of e wells in this district for a time yielded as much as 30,000 bbl. ily, but after 1920 production steadily declined.

Education.—The constitution of 1921 vests control of the pub- elementary and high schools and all other state educational stitutions except the state university in a Board of Education eleven members. School attendance is compulsory for 140 days each school year by all children between the ages of 7 and 14 ars. This law, however, has not been strictly enforced because the lack of school facilities, and in 1923 only 76·8% of the white ildren of school age, and 58·2% of the negro children were en- lled. Substantial improvement in school facilities, however, curred after 1919. In that year total school expenditures were ,702,000; by 1923 they had increased to $25,430,000. The aver- e salary for white male teachers in 1923 was $1,353, compared th $1,011 in 1919; for white female teachers $1,009 in 1923, com- red with $598 in 1919. Between 1919 and 1923 salaries of negro ıle teachers increased from $298 to $525, and of female negro ıchers from $217 to $408.

History.—Although the state is normally democratic, there s a temporary defection from the Democratic party after 1913 that section of the state where the production of cane sugar is chief industry. This was due to the unpopularity of the riff Act of 1913, enacted by a democratic congress and materi- y reducing the duties on sugar. By 1920 the breach in the rty was healed. The state ratified the Eighteenth (Prohibition) deral Amendment Aug. 3 1918. The industrial canal at New leans was opened to navigation Feb. 6 1923. This canal con- cts the Mississippi river with Lake Pontchartrain and gives pping more direct access to the sea than is possible by follow- the winding course of the river for 90 m. to its mouth. The ıal is 5½ m. long and was 5 years in building. The governors er 1908 were: Jared Y. Sanders (Dem.) 1908–12; Luther E. ll (Dem.) 1912–6; Ruffin G. Pleasant (Dem.) 1916–20; John Parker (Dem.) 1920–4; Henry M. Fuqua (Dem.) 1924–

(W. O. S.)

OUISVILLE, Ky., U.S.A. (*see* 17.63), lost one of its principal lustries through the elimination of its distilleries by the ghteenth (Prohibition) Amendment to the Federal Constitu- n. Its tobacco market was affected by the development of co- erative marketing and loose-leaf marketing of tobacco in ntucky. In compensation many new industries were added the already long list. The total output of the plants within the y was valued at $101,284,000 in 1909; $204,566,000 in 1919; 40,537,718 in 1923. In 1922 annexations of territory (11,000) increased the area to 36 sq. m., but important plants were l outside the corporate limits. The leading industries in the uisville district in 1925 were tobacco (value in 1923, $25,678,-), car works, sanitary plumbing fixtures, petroleum refining, ughtering and meat-packing. The population in 1920 was ,891 (91·4 males to 100 females), of whom 40,087 were negroes slight decrease since 1910) and 11,667 foreign-born (a decrease 34%). A special census in Dec. 1925, under the supervision of the U.S. Census Bureau, showed a population of 305,935.

Bank clearings increased from $667,947,515 in 1914 to 611,927,608 in 1924. Investment in building in the six years following the World War amounted to over $100,000,000, of which more than half was for 10,000 dwellings. Many of the characteristic low structures were replaced by apartment houses, hotels and tall business buildings. By 1925 sewer construction costing $4,600,000 was completed, and additional work of an equal amount was under way; the municipally-owned water company was beginning a four-year programme of expansion, to cost $4,498,000; construction of the war memorial auditorium was awaiting the outcome of litigation over the site; a new municipal highway bridge to Jeffersonville, Ind., was planned; work was begun on the elimination of grade crossings, and also on a hydroelectric plant (initial capacity 108,000 H.P.) at the Falls of the Ohio. Canalisation of the Ohio river from Pittsburgh to Louisville was completed in 1925, and completion of the project to Cairo is expected by 1929.

In 1910 the public schools were placed under the control of a non-partisan Board of Education. The University of Louisville (enrolment, 1925, 1,200) moved its school of arts and sciences to a new 55-ac. campus in Sept. 1925, and $1,000,000 was voted by the city in November for new buildings. Additions to the university include the Speed Scientific School (opened 1925); the Louisville College of Dentistry (formerly affiliated to Centre College); an Art Museum (under construction); and an extension centre for negroes (to be opened 1926). The Southern Baptist Theological Seminary also moved (Jan. 1926) to a new campus of 51 ac. and a fine plant built at a cost of $2,000,000.

LOURENÇO MARQUES, Delagoa Bay (*see* 17.65), has a population (1925) estimated at 22,000, including 8,000 Europeans. There is safe entrance to the harbour and the minimum depth of water in the Cockburn Channel is 25 feet. The port offers ample accommodation and facilities to shipping, including coaling and cold storage plant. Many of the leading merchants are British and most of the traffic of the port is transit trade with the Transvaal, whence it obtains its coal for export and bunkering.

Competition between the port and Durban for the Rand trade led to a convention (known as the Mozambique convention) being made with the Transvaal in 1909. Among other things it provided that 50 to 55% of the railway traffic in the "competitive area" of the Transvaal should pass through Delagoa Bay; the percentage going through the bay in 1914 was 48·79 and never exceeded that figure until 1922, when it was 52·86. The Union Govt. then denounced the convention, which lapsed on March 31 1923. The provisions it contained for the recruitment in Portuguese territory of native labour for the Transvaal mines and forbidding differential duties on merchandise passing between Lourenço Marques and the Transvaal were, however, preserved by a *modus vivendi*. Negotiations for a new convention had not, up to the middle of 1926, resulted in an agreement.

The value of goods in transit through Lourenço Marques was £4,547,000 in 1912; £2,334,000 in 1915; £5,176,000 in 1919 and £4,806,000 in 1923, in which year re-exports were valued at £1,244,000, as against £411,000 in 1912. Exports of local produce were valued at £162,000 in 1913 and at £789,000 in 1923. The number of vessels entering the port in 1924 was 644, the tonnage being 3,060,000 gross. In the latter part of 1925 the depreciation of the Portuguese currency and the abolition of the use of sterling currency caused serious difficulties to importers and led to strikes and disturbances which continued into 1926 when the position began to improve.

See the *Delagoa Directory, 1925* (Lourenço Marques and London) and the *South and East African Year Book* (London, annually).

LOUVAIN, Belgium (*see* 17.67), with a population of 40,693 in 1923, suffered very severely during the World War, and was given the Croix de Guerre in 1925. In Aug. 1914, after the German entry, about one-third of the town was burnt, including the whole of the Rue de la Station and the Place du Peuple, the Vieux Marché, the Palais de Justice, the Théâtre, and the famous Halles Universitaires, with its splendid library; the interior and roofs of the collegiate Church of St. Peter were seriously damaged, and the chimes destroyed. The elaborate Gothic Hôtel de Ville, damaged in 1890 and in process of restoration in 1914, was used as headquarters by the Germans, and was not further harmed; the restoration has since been completed.

Restoration Works.—Rebuilding, studiously on the old models, was started soon after the War, and early in 1925 few signs of the ruin done were outwardly visible, though much remained to be finished. The Place de la Station, where a number of civilians were killed and buried, has been renamed Place des Martyrs, and the rebuilt Rue de la Station is now called Avenue des Alliés. A striking War memorial has been erected. The university was reopened in 1919, with a larger number of students than before the War. The foundation stone of the new university library was laid in 1921, and the first wing opened in 1923. The building, in the Flemish style, is being paid for by American citizens, and books and fittings have been contributed by many nations. About 500,000 books had been collected when the new wing was opened, nearly 50,000 coming from the John Rylands Library, Manchester. The church of St. Peter was undergoing restoration in 1926.

LOW, SETH (1850–1916), American administrator and educationalist (*see* 17.72), died at Bedford Hills, N.Y., Sept. 17 1916.

LOWELL, ABBOTT LAWRENCE (1856–), American educationalist (*see* 17.73), built for Harvard at his own expense a president's house, which was finished in 1912. From the time that he became president (1909) he took great interest in the social life of the students (*see* HARVARD UNIVERSITY). President Lowell was a strong supporter of free speech among the members of the faculty. After the outbreak of the World War in 1914 he refused to accept the resignation of Prof. Münsterberg, who had defended the German cause. In 1915 Prof. Kuno Meyer, of the University of Berlin, sent a letter of protest because of the publication in one of the college magazines of a satirical poem, *Gott mit Uns*, by an undergraduate. In his reply President Lowell pointed out that freedom of speech was an important characteristic of American universities as distinguished from those in Germany. He was chairman of the executive committee of the League to Enforce Peace, and later was a strong supporter of the League of Nations. Lowell was the author of *Public Opinion and Popular Government* (1913), based on lectures at Johns Hopkins University; *The Governments of France, Italy and Germany* (1914), abridged from his earlier *Government and Parties in Continental Europe;* and *Greater European Governments* (1918), abridged from earlier works.

His brother, PERCIVAL LOWELL (1855–1916), American astronomer (*see* 17.73), died at Flagstaff, Ariz., Nov. 12 1916. In 1910 he lectured in London before the Royal Institute, and in Paris before the Association Astronomique.

LOWELL, AMY (1874–1925), American poet, critic and lecturer, was born Feb. 9 1874 in Brookline, Mass., being a sister of Abbott L. and Percival Lowell She came of a line of public-spirited lawyers and men of affairs, who for three generations had been, like herself, lovers and planters of gardens. She received her education from her mother, who was an accomplished musician and linguist, and from private schools; and she later travelled abroad extensively, visiting Greece, Constantinople and Egypt. After her father's death in 1900 she occupied herself with municipal affairs, until "about 1902," she writes, "I discovered that poetry . . . was my natural mode of expression. And from that moment I began to devote myself to it seriously." But she published nothing for nine years, when, in 1910, her first published poem appeared in *The Atlantic Monthly*. Her first volume, *A Dome of Many-Coloured Glass*, is dated 1912. Thereafter her books followed each other in rapid succession: *Sword Blades and Poppy Seeds* (1914); *Six French Poets: Studies in Contemporary Literature* (1915); *Men, Women and Ghosts* (1916); *Tendencies in Modern American Poetry* (1917); *Can Grande's Castle* (1918); *Pictures of the Floating World* (1919); *Legends* (1921); *Fir-Flower Tablets*, with Florence Ayscough (1921); *A Critical Fable* (1922); *John Keats* (1925); *What's O'clock* (1925); *East Wind* (1926). During all this period Miss Lowell contributed critical articles to various magazines, and lectured extensively. In 1920 she received the degree of Litt.D. from Baylor University. She had suffered from a serious malady for years, and on the eve of a visit England, during which she was to have lectured at Oxfo Cambridge, Eton, Edinburgh and elsewhere, it became acu and she died suddenly, May 12 1925, at Brookline, Mass.

Miss Lowell, during her later years, was the most striki figure in contemporary American poetry. Her vivid and pow ful personality, her intellectual vigour and independence, a her zest in life gave her a conspicuous and in some respects unique position. She was an acknowledged leader of the gro in America and England which called itself the Imagists. B through all her radicalism ran a strong conservative strain, a she never abandoned conventional verse forms, nor for so years before her death had she been affiliated with any scho Among her contributions to poetry must be reckoned the p fecting, in her best work, of the technique of "free" verse; h almost unrivalled command of the vocabulary of sensuous i pressions; the wide range of the themes to which she has giv poetical expression, and the clarity and restrained beauty many of her shorter poems. Her most important critical wo the result of long and devoted labour, is the biography of Kea which essays to reinterpret him as "a new generation of po and critics" regards him. (J. L. L.*)

LOWELL, Mass., U.S.A. (*see* 17.76), had in 1920 a populati of 112,759, an increase of 6·1% in 10 years. The foreign-bo population numbered 38,116 (including 10,180 French Ca dians), a decrease of 12·5%. In 1925 the state census showed decrease of the total population to 110,542. The factory outp had a value of $59,688,000 in 1909; $137,802,000 in 1919; $8 645,704 in 1921; $100,998,057 in 1923. Lowell was affected the long strike of the textile workers in 1922. The commissi form of government was adopted in 1911, but in 1920 the chart was again amended, providing for a mayor elected at large and city council composed of one member from each of the nine war and six elected at large. On Dec. 9 1925, 10 officials, includi the mayor and a former mayor, were arraigned on charge of co ruption. A beautiful memorial auditorium was erected (192 in honour of the men and women of the city who took part the wars of the country. Lowell has the usual characteristics a mill town—a preponderance of women in the population (92 males to 100 females, 1920), a high proportion of women a children at work (38·7% of all females 10 years of age and ov 8·8% of the children 10–15), a high infant mortality (1 deaths under one year per 1,000 births, 1923) and a low percen age of home ownership (26·1% in 1920), due to mobility labour.

See George F. Kenngott, *The Record of a City; a Social Survey Lowell, Massachusetts* (1912).

LOYSON, CHARLES (1827–1912), better known as Pè Hyacinthe, a famous French preacher, was born at Orléans. was educated for the priesthood and entered the Carméli order. His eloquence drew large crowds to his Advent sermo in Notre-Dame between 1865 and 1869, but his orthodoxy f under suspicion, and in 1870 he associated himself with Dölli ger's protest against the dogma of papal infallibility (*see* 14.51 20.67). Being excommunicated he broke finally with the Chur of Rome, and removed first to Geneva and then to London. married an English lady, Emily Jane Merriman, and settled Paris in 1877, where he founded an Old Catholic Church. died in Paris Feb. 9 1912.

LUCAS, EDWARD VERRALL (1865–), British man letters, was born at Brighton and educated at University Colleg London. He then started journalism, working first on a Suss newspaper, then in London with *The Globe*, and became a fr quent contributor to *Punch* and later its assistant editor. acted for many years as publisher's reader to the firm of Methue and became head of this company after the death of its found (1925). Lucas wrote a very large number of miscellaneous book but is best known as a light essayist in the vein of Elia, a published many collections of these essays. His edition of t *Letters of Charles and Mary Lamb* (1903–5) and his *Life of Lam* (1905) likewise showed how congenial was his talent with th of Elia. He was successful also as a writer of travel impression nong these being *A Wanderer in Holland* (1905), *A Wanderer : London* (1906) and *A Wanderer in Paris* (1909), and his books ı art showed powers of wide appreciation, as in *The British chool* (1913), *Vermeer of Delft* (1922), *John Constable* (1924). ight fiction, children's books, humorous skits and many ıthologies have also issued from his singularly fluent pen.

LUCAS, JOHN SEYMOUR (1849–1923), British painter (*see* 7.93), died in hospital at Southwold, Suffolk, after an accident, ı May 8 1923.

ŁUCK, or **LUTSK, BATTLES OF.**—Under this heading are scribed the Russian attacks on their southwestern front—hich extended from the Pinsk marshes to the northern frontier Rumania—during the summer and autumn of 1916. These tacks are generally known as "Brusilov's offensive." The riginal break-through of the Austrian front occurred near the own of Łuck (Lutsk), in Volhynia, on the river Styr, which ıus gives its name to the whole series of operations (*see* EASTERN UROPEAN FRONT: MAP).

General Situation in May 1916.—After the costly failure of ıeir attacks in March (*see* LAKE NAROCH, BATTLES OF), the ussian supreme command had set to work to prepare a large ale offensive on the front west of Mołodeczno, as their contri-ıtion to the great general Allied offensive which was to open on l fronts on July 1. Elaborate preparations were made during pril and May for this Mołodeczno attack, in which 26 divisions ere to carry out the initial assault. The Russian line was at is time divided into three fronts: the Northern, from the Gulf Riga to south of Dvinsk, containing 38 divisions; the Western, own to and inclusive of the Pinsk marshes, containing 58 divi-ons; and the Southwestern, down to the Rumanian frontier, ntaining 38 divisions. The Pinsk marshes also formed the viding line between the German and Austrian sectors of the astern front. In the German sector there were approximately German and two Austrian divisions; in the Austrian sector ere were 38 Austrian and three German divisions. Since the eat offensive of the Central Powers against Russia had come an end in the autumn of 1915, their forces on the Eastern ont had been considerably reduced. The Germans had taken oops for their Verdun offensive, and the Austrians during the ring had withdrawn formations for an offensive against Italy. ıe Russians, on the other hand, had recovered rapidly from eir disasters of the previous year; the ranks were full and muni-ons more plentiful than before.

Preparation of Brusilov's Offensive.—Gen. Brusilov suc-eded Ivanov as Commander-in-Chief of the south-western ont in March. He was a cavalry soldier and had commanded e VIII. Army since the commencement of the War with con-icuous success. He received instructions to prepare attacks on e south-western front to distract the enemy's attention from e main Russian effort at Mołodeczno. The four armies under usilov were: the VIII. (Kaledin) from the Kowel-Kiev rail-y near Rafałowka to about Kremenets, 11 divisions and ır cavalry divisions; the XI. (Sakharov) from Kremenets to ar Tarnupol, eight divisions and one cavalry division; the I. (Shcherbachev) from near Tarnupol to Potok, seven divi-ns and 3½ cavalry divisions; and the IX. (Lechitski) from tok to the Rumanian frontier, 10 divisions and three cavalry visions. There was one corps (two divisions) in reserve.

The Austrian IV. Army (Archduke Joseph Ferdinand), from ar Rafałowka to Dubno, with 10½ divisions and one cavalry vision, and the II. Army (Böhn-Ermolli, from Dubno to near emenets, with eight infantry and two cavalry divisions, were posed to Kaledin; the German Southern Army (von Bothmer) th one German and nine Austrian divisions and two cavalry visions, held a long front, corresponding approximately with ose held by the Russian XI. and VII. Armies; while the Aus-an VII. Army (Pflanzer-Baltin), with 8½ divisions and four valry divisions, opposed Lechitski. In the actual number of visions there was little disparity between the total forces at disposal of either side; the Russians had 38 divisions and 12 valry divisions to the Austro-German 37 divisions and nine cav-y divisions; but the Russian divisions were larger. The Austrian front had been strongly fortified and organised, and in spite of the removal of some of their most reliable divisions and much heavy artillery to the Italian front the Austrians were confident of being able to hold their ground.

About the middle of April, Brusilov had ordered each of his army commanders to select a sector of attack and to make preparations with the resources at his disposal within his own army to penetrate the enemy's front in that sector. Preparations were to be complete before the middle of May. These attacks were designed simply as aids to the main Russian offensive in the north, timed for July 1. On May 14, however, the Austrians began an offensive in the Trentino against Italy. The Italians appealed to the Russians to relieve the pressure by attacking the Austrians on their front. Brusilov accordingly launched his attacks on all four army fronts on June 4, without any expectation of a decisive break-through or arrangements for exploitation of success on a large scale.

The Break-through at Łuck.—The sector of attack chosen by Kaledin, commander of the VIII. Army, centred on the village of Olika, east of Łuck. The bombardment began on June 4 and the assault was made by the XL. and VIII. Corps early on June 5. The XL. Corps carried three lines of enemy trenches and penetrated over two miles, and the VIII. Corps, though less successful, made considerable progress. The advance continued on June 6 and on June 7 reached Łuck. By this time a wide gap had been made between the Austrian IV. Army and the II. Army further south, and a great opportunity for the numerous Russian cavalry seemed to have come. But of the four cavalry divisions allotted to Kaledin's army, two had been used to hold trenches so as to enable infantry to be concentrated for the assault and one was dispatched by Brusilov in a fruitless raid along the railway towards Kowel through marshes entirely unsuited for cavalry action. The one remaining division could accomplish little. Meanwhile the left wing of the VIII. Army occupied Dubno on June 9; on June 10 the front of the army lay along the line of the rivers Styr and Ikwa, from Rozyszcze through Łuck to Dubno.

Attacks of the XI., VII. and IX. Armies.—The attack of the XI. Army northwest of Tarnupol was a failure. Shcherbachev's VII. Army attacked in a sector on its extreme left near the village of Jaziowec. After two-days' bombardment the infantry assaulted early on June 6 and carried the enemy positions; next day the Austrians were driven behind the Strypa. The Russians crossed the river on the 8th and gained further ground during the next two days. Counter-attacks then arrested their advance for the time being. Lechitski's IX. Army attacked some 20 m. north of Czernowitz, near the village of Okna, with complete success. By June 10 the front was broken and the Austrians retreated in disorder behind the Prut. Czernowitz was captured on June 17.

Consequences of Brusilov's Success.—Thus by the middle of June the Austro-German front south of the Pinsk marshes was completely broken on both flanks, and two armies, the IV. and VII., were in full retreat. In the centre Böhm-Ermolli's and von Bothmer's armies still held, though their outer flanks had been driven in. On three-quarters of the whole Russian southwestern front their armies were moving forward. These entirely unexpected results of an offensive undertaken purely as a demonstration reacted instantly on the whole strategy both of the Russians and of the Central Powers. On the Russian side, the new situation demanded the immediate transfer of the principal reserves from the north, where they had been grouped for the Mołodeczno offensive, if Brusilov's success in the south were to be exploited. The decision was taken promptly enough, the Mołodeczno offensive was abandoned, Lesh's III. Army astride the Pripet was added to Brusilov's command and troops were hurried south as rapidly as the capacity of the railways would permit. Unfortunately for the Russians, the poverty and low efficiency of their communications gave the enemy time to concentrate sufficient reinforcements to restore their front before the full weight of the Russian reserves could give a fresh impetus to the advance.

For the Germans, the sudden reverse came at a difficult time, for they were fully engaged at Verdun and were expecting a Franco-British offensive at an early date; obviously, too, events might have a decisive influence on the attitude of Rumania. Reinforcements were at once collected to restore the situation; to close the principal gap, it was decided to stage a counter-attack on a large scale on both sides of the Kowel-Rowne railway. This attack was entrusted to von Linsingen, the German commander of the Austro-German Army holding the area of the Pinsk marshes opposite the Russian III. Army. He was reinforced by three German divisions from the northern part of the Eastern Front, four from France and two Austrian divisions from the Trentino. During the whole of the latter half of June, as these reinforcements arrived, he counter-attacked persistently towards Łuck and to the north and south of it. These attacks, though they brought the Austro-German forces little gain of ground, had at least the effect of limiting Kaledin's break-through. On July 4, the left of Lesh's III. Army, in conjunction with Kaledin's right, launched an attack in the bend of the Styr east of Kowel and drove von Linsingen's army back to the Stochód river. This put an end to the Austro-German counter-attacks, and there were no further important operations on this part of the front till the end of July.

Occupation of Bukovina.—Meantime, Lechitski in the south was completing the conquest of the Bukovina. After the capture of Czernowitz, part of the Austrian VII. Army retreated precipitately south to the Carpathians, pursued by the left wing of Lechitski's army, which occupied Kimpolung on June 24. His right wing, advancing between the Dniester and the Prut, won a victory on June 28 and occupied Kolomyja on the following day. At the beginning of July the Austrians in the south received reinforcements and made a series of counter-attacks opposite Kimpolung and Delatyn. These were defeated, and Lechitski's right wing occupied Delatyn on July 10. His army was now, however, enormously extended and had to halt to await reinforcements.

Reorganisation of Command by the Central Powers.—The German command, which had since the beginning of June sent 16 divisions to the front south of the Pinsk marshes, naturally claimed an increased influence on the direction of operations on this front. Very shortly after the first break-through at Łuck they had insisted on the removal from his command of the IV. Army of the Archduke Joseph Ferdinand and on the extension of von Linsingen's sphere of command southwards to the northern frontier of Galicia. The greater portion of Pflanzer-Baltin's VII. Army had also been transferred to von Bothmer commanding the German Southern Army. It was now proposed to appoint Hindenburg to the supreme command of the Eastern Front as far south as Lemberg; the remainder of the front, on both sides of the Dniester and in the Carpathians, was to be under the Austrian heir apparent, Archduke Charles Francis Joseph, with the German General von Seeckt as his chief of staff.

This arrangement was eventually brought into force early in August. The Archduke Charles had originally come from the Italian front at the beginning of July to command a XII. Army, which was to be formed from troops on the spot and fresh reinforcements, and was to deliver a counter attack on a large scale on both sides of the Dniester in a southeasterly direction. But as the incoming reinforcements had always to be thrown into the battle so soon as they arrived, the formation of the XII. Army and the proposed counter-offensive never took place. Instead, the III. Army command from Tirol took over the troops between the Carpathians and the Dniester. The Archduke's command thus comprised the VII., III. and Southern armies.

Battle of Brody.—During the latter half of July, while the VIII. and IX. armies on the flanks paused to await reinforcements, Brusilov ordered Sakharov's XI. Army, which had extended its front northwards to beyond Dubno, to take the offensive. It attacked near Boromel, southwest of Łuck, on July 16 and drove the enemy back across the Lipa. Sakharov then moved south on Brody, which he captured with 40,000 prisoners on July 28—a fine victory. Meanwhile Shcherbachev's VII. Army, in spite of repeated attacks northwest of Buczacz towards Monasterzyska, had failed to make much impression von Bothmer's Southern Army. Lechitski, however, at the e of July gained some ground towards Stanislau.

Attack on Kowel.—Towards the end of July the Russian Gua Army (I. and II. Guard Corps, I. Corps, XXX. Corps, Gua Cav. Corps) detrained from the north and took up a front b tween the III. and VIII. armies. The Guard had not be in action since the previous Sept. and had been careful trained and kept in hand for a great occasion. It was now d cided to use it to force the line of the Stochód river and captu Kowel. It is difficult to understand why this line of advan was chosen for a supreme effort. The terrain is mainly mar and advance is usually possible only on narrow causeways. T attacks, which commenced on July 28 and were continued up Aug. 10 resulted in a complete and costly failure. The Gua Army lost 55,000 men for a trifling gain of unimportant groun Brusilov thereafter abandoned the direct advance on Kow but continued up till the middle of Oct. attempts to enlar the Łuck salient in the direction of Włodzimierz Wolynski. these attempts ended in failure.

Conclusion of the Offensive.—In the south, Lechitski attack again south of the Dniester on Aug. 7 and drove back Köve III. Army. He occupied Stanislau on Aug. 10 and Nadwór on Aug. 12. On this latter date the VII. Army occupied Monaterzyska. Under the threat from this flank and pressure fro Sakharov's army south of Brody, von Bothmer now at last ga up the original line which he had held throughout all the turmo and withdrew towards Brzezany.

Austro-German counter-attacks in the Carpathians in t first half of Aug. had little success. On Aug. 20 the Russia reorganised their front so as to allow Lechitski's IX. Army have as its only task the forcing of the Carpathian passes b tween Delatyn and Kimpolung, in order to protect the rig flank of the Rumanians, who joined the Allies on Aug. 27. spite of severe fighting throughout Sept. little progress w made on this front. Nor was any appreciable advance ma elsewhere on the southwestern front in spite of repeated a saults. In Oct. the defeat of the Rumanians necessitated t transfer of troops to that theatre and the abandonment of fu ther offensive operations. The summer which had opened brilliantly ended in disappointment and failure.

Results of the Offensive.—Although Brusilov had recaptur practically the whole of the Bukovina and large portions Eastern Galicia and Volhynia and had taken some 350,0 prisoners and over 400 guns, the cost had been exceeding heavy. The casualties on the southwestern front were over million. These losses and those suffered in the abortive attac on the Northern and Western fronts in 1916, at Lake Naroc Baranowicze and Riga, were in the end the principal cause of t rapid infection of the army with anti-war propaganda when t revolution came. In fact the revolution itself was partly due disappointment at the outcome of the 1916 campaign, from whi so much had been hoped. The campaign showed the striki contrast in fighting qualities between Austrian, German a Russian troops. In spite of their lack of artillery and techni equipment, Brusilov's armies broke through the strongly for fied Austrian lines and would have completely destroyed t Austrian armies but for the presence of German troops, agair whom their assaults invariably broke down.

It is difficult to trace any strategical conception underlyi the Russian operations; the time and place for the various a tacks seem to have been chosen on purely local consideratio This was largely due to the unexpected nature of the succ and to the poor communications, which prevented the tim transfer of reserves from one portion of the front to anoth Hailed by her Allies as proof of the complete regeneration of t Russian Army, Brusilov's offensive was really its death-knell

LUCY, SIR HENRY (1845–1924), British journalist, was born at Crosby, near Liverpool, Dec. 5 1845. Educated in Liverpool, he began life in a Liverpool merchant's office, but soon became a reporter for a Shrewsbury periodical. In 1870 he joined the staff of *The Pall Mall Gazette*, London, and in 1873 became pariamentary reporter to *The DailyNews*, with which paper he had a long connection in various capacities. In 1881 he also joined he staff of *Punch* and won a great reputation as the contributor of its parliamentary sketch signed "Toby M.P." He was knighted in 1909 and retired from parliamentary work in 1916. He published his autobiography, *Sixty Years in the Wilderness*, n 1909, and *The Diary of a Journalist* in 1920. He died Feb. 0 1924.

LUDENDORFF, ERICH (1865–), German soldier, was born at Kruszevnia, in the province of Posen, April 9 1865. When 18 years old, he entered the Prussian Army. In 1894 he oined the General Staff, and, except for an interval of two years s company commander, remained on it from 1894 to 1913, nder Count Schlieffen and the younger General von Moltke. As chief of the *Aufmarschabteilung*[1] since 1908 he played a prominent part in the mobilisation preparations. The last great ncrease in the strength of the army in 1913 was largely due to is initiative and energy. During the year preceding the outreak of the World War he commanded first the 39th Fusilier Regiment at Düsseldorf, and afterwards an infantry brigade at trasbourg.

At the outbreak of the World War Ludendorff was quartermaster general of the II. Army. His voluntary assumption in the eginning of Aug. of a decisive rôle at the capture of the fortress f Liége gave him his first great opportunity. He took over the command of the 14th brigade of infantry, in the place of General on Wussow who was killed, and, breaking through the ring of ortifications at its head, seized the interior of the town. He as rewarded on Aug. 22 by being made chief of staff to Hindenurg in the VIII. Army which was fighting in East Prussia.
